CHRONICLER OF THE NEGLECTED TRUTH

BRIEFLY TOLD

A three-foot crust of soda composes the glittering white surface of an African lake, with an area of 34 square miles.

At Port Moresby, New Guinea, the cool native hut, built on poles over the water, is much superior to the houses of galvanized iron and wood the white man puts up for himself to swelter in.

The Karo-Bataks, natives of the mountainous regions of the Island of Sumatra, have a written language resembling ancient Phoenician.

The costliest map in the world is in the Louvre of Paris. It has a groundwork of polished jasper, the principal towns marked with precious stones and their names inscribed in gold. Strips of polished platinum represent rivers.

A warm current sweeping southward along the west coast of South America brought torrential rains to sections that have not known rain since 1551, causing the desert to bloom in profusion.

The will of the late Willard L. Metcalf, the American artist, directed that twenty-nine of his paintings be destroyed, because they did not come up to his best work.

The Parthenon of Athens is to be restored.

At Caerphilly, in Glamorganshire, Wales, there is a tower which leans eleven feet in eighty. Even the tower of Pisa, Italy, leans only six feet in the same height.

A wealthy Scotsman, 75 years old, is traveling 7,000 miles from Honolulu to Scotland to pick a few sprigs of heather and eat a dish of haggis.

They had no house detectives in the old hotels or taverns of Pompeii. Instead, on the wall was inscribed the following: "*Otiosis locus hic non est, discede morator,*" which, translated, means, "Lingerer, depart; this is no place for idlers."

Airplane travel at a cent a mile is the accomplishment of a French flier.

Sixty per cent of our national lawmakers at Washington are lawyers.

Harvard University will receive a fraction of every cent dropped into the various penny-in-the-slot machines on the New York subway and elevated stations under the will of Artemas Ward.

A bonfire of 100,000,000 lire in bank notes was made recently in Rome, as the inauguration of the policy of the government to reduce the circulation of paper money.

Madame Schumann-Heink says, "You do not need to go abroad to study. We have just as good teachers right here in this America, as they have abroad. I'll have all those foreign teachers on my neck for saying it—but it's true and I'll stick to it."

It is said that Dickens wrote an entire book with a single quill pen.

In Juneau, Alaska, the thermometer rarely reaches zero.

Among the Sikhs of India it is a rule that deaths and births must take place on the ground.

The New York Public Library is consulted by more than eight thousands persons daily.

The wild boar of India, without provocation, will attack man.

Female pythons not only lay eggs, but incubate them by brooding them, as birds do. The young snakes hatch three months from the time the mother begins sitting on the eggs.

The word "sheik" in Arabic means "an old man."

In the past 3,000 years fifteen nations have held Sicily.

Benjamin Franklin laid the foundation of the present postal system of the United States.

The first one-dollar bank note of the "greenback" variety ever issued by the United States Government—it is numbered one—is owned by the wife of an officer in the Internal Revenue service.

Platinum wire has been drawn so fine that a mile of it would not weigh more than a grain, while seven ounces of it would extend from New York to London.

More than half the destructive pests in the United States are of foreign origin.

A certain Leopold Hapsburg sentenced to pay 100,000 crowns to the relatives of a man whom he had struck and killed with his motorcycle asked the privilege of paying it in monthly installments as he is only a modest bank clerk. He was a former archduke of Austria.

Japanese girls are bobbing their hair. They have formed a society in Tokio to which only women are admitted who have discarded the elaborate traditional hair arrangements of Japan for the modern bob.

Several small coins, dated in the fifties, and the remains of an old flintlock musket were all that remained with the bones of a pioneer found in a hollow tree on the Missouri Valley River bottom near Hamburg, Iowa. It is believed he hid in the crevice to escape Indians and was unable to climb up to the entrance hole from the inside of the tree.

No privately owned automobile in Rio de Janeiro, Brazil, may be painted red or white, as these colors are used exclusively by the city for its municipal cars.

The advent of radio has added approximately five thousand words to the English language.

After Pietro Mascagni had written "Cavalleria Rusticana," he is said to have thrown it into the fire, from which his wife rescued it.

Spartan governors' secret service men used a method of winding parchment round a staff slantwise, then writing so that when unwound, the message appeared as a string of broken letters. The correspondents had a staff exactly like the original on which they rewound the parchment.

About three and one-half times as much of our cultivated crop land is devoted to growing feed for our farm animals as for producing crops for human consumption.

Old abandoned ice houses along the Hudson River are being converted into mushroom farms. The biggest of the one-time ice houses can produce a $600 crop every day.

This Issue

Mr. Ford's Page resumes discussion of the charge that the day's pace is nervously ruinous. (p. 11)

The Booth Myth is effectually laid by Mr. Black's unsparing investigation. This concluding article, summing up proofs of the identity, is the last word. (p. 18)

G. K. C. is one of the most virile and provocative minds operating today, withal a fearless one who knows his world. A delightful interview at Chesterton's home. (p. 2)

Is bigness of business necessarily anti-social? Huston Thompson ought to know. As Chairman of the Federal Trade Commission, it is his big problem. He has exact knowledge. Deepen and broaden your mind by reading him. (p. 3)

Tom Masson on "What Is an Intellectual?" (p. 5)

Here's a man who actually says that the human race will grow wings as a result of the "flying feeling" which airplaning will develop. It may not be true, but it's timely. (p. 6)

More persons like maps than you would surmise. At least judging from the interest aroused by Professor Karpinski's articles. This week, "Mapping the Mississippi." (p. 12)

Charles J. Finger appears in this number both as subject and author. Variety and Virility describe Finger. He has been everywhere and has seen everything, but he likes his mountains best, and there he stays and writes. He likes Romantic Rascals too, as will be seen on p. 16. (Note Paul Honore's woodcuts!) Finger himself, under dissection by another writer, appears on p. 14.

Mr. Aaron Sapiro also has the honor of appearing in this first issue of the new series, in a further description of his remarkable activities among gullible farmers. (p. 18)

Together with useful, lively bits from here and there; Editorials; Briefly Tolds—this comprises the week's bill of fare.

An Afternoon With an Optimist

A Talk With G. K. Chesterton

By W. TEIGNMOUTH SHORE

Top Meadow.

BUCKINGHAMSHIRE is a county of placid beauties; quiet homeliness; secure contents; a countryside of beech trees, orchards, rolling fields of wheat and grass; of sedate old towns and sleepy villages; of timber-framed farmhouses and cottages; of—well, of all the many good things that figure in a typical Southern England county. Very lovable; very soothing to the town dweller.

In this county, some twenty-two miles from London, is the smallish town of Beaconsfield, to which I went on a fine but chilly August day to visit Gilbert Keith Chesterton, essayist, poet, playwright, and writer of fiction.

It was a pleasant walk of about a mile from the railroad station—the gusts of sunshine not unwelcome for the air bit shrewdly—till I reached Top Meadow, an ancient looking but really recently built house, standing a little aside from the main road. There is an old-world savor not only in the general aspect but more particularly in the garden, which is a mass of brilliant blooms; old-fashioned flowers such as my heart delights in.

Then a kindly welcome from Mrs. Chesterton and G.K.C. "This room does for everything," he said, as we went into the spacious living room; and I said that I envied him having achieved my ideal of a home with a living room and rooms to sleep in; no more; what more is needed? Is not a living room the most sociable of all rooms?

Edmund Burke Lived Near Here

"We built it ourselves," said Mrs. Chesterton. "Before the war we lived on the opposite side of the road, but built this room as a sort of studio; then we had to turn out, so came over here to live, adding on other rooms to make a house of it."

"What a delightful garden," said I, looking out of the long, low, deep-seated lattice window at the stone-paved paths, the quaint water pond in its stone basin, at the brightness and glory of the flowers.

"I'm glad you like it; I had just to plant anything and everything that would grow quickly. Will you sit by the fire?"

A fire upon an August afternoon! It looked cheerful on the deep hearth; but I turned my back upon it, preferring the outlook on the flowers and the trees.

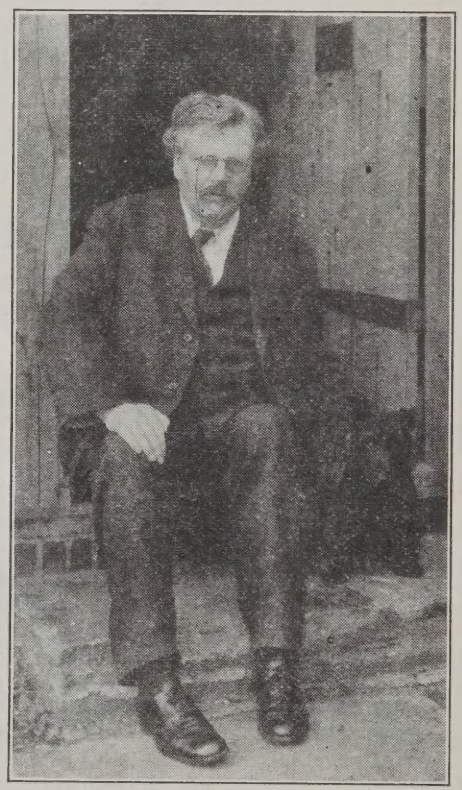
G.K.C. in a reposeful armchair, smoking a cigar; I in another, enjoying a Russian cigaret; Mrs. C. leaving us to our talk.

He talks as entertainingly as he writes, which is saying a deal. Talks almost overwhelmingly, but it is not an unhappy fortune to be drowned in good wine! There is plentiful variety, too; nimbleness of thought; stimulation; and, perhaps best of all, a certain bite of challenge now and again, almost a definite provocation which arouses that sp'rit of contradictoriness and antagonism which is essential to entertaining conversation.

But we started our talk quite simply.

I asked why the house was called Top Meadow.

"It's the old name of the field it is built on; the highest, or perhaps only the end one of a series of fields. They were part of Burke's estate here; he lived at Gregories, as you know."



"G. K. C." on his own doorstep.

He looked at me with something that appeared like a quiz in his eyes. "As I knew!" Well, I did happen to know; but that little phrase cropped up several times, and it was not always that I did know! But I didn't let on! This time I did know, having taken the trouble to rub up my vague recollections; that Edmund Burke had lived hereabout, at Gregories, later called Butler's Court, of which nothing now remains. But today I was not hunting dead lions; but very much interested in snaring this living one, whom I hoped to stir into a roaring!

Fortification to Keep Off Visitors

"Lord Beaconsfield lived not far off? Hughenden isn't far away, is it?" I asked.

"Not far. Burke would have taken a peerage, as you know—" I didn't—"but for his son's death; and his title would have been Beaconsfield. Dizzy found the coronet suspended in air, so to speak, like Mahomet's coffin; took it down and put it on his own head. Which doubtless the clever little Jew man thought was a romantic thing to do, instead of only vulgar."

We slid about from one topic to another in a most amazing way; like two burly bees from flower to flower; but he gathered most of the honey.

"Do you like living in the country better than in town?"

"Yes; I can work better here. And I don't go up to town as often as I thought I should."

"Yes, I am fond of flowers," he answered in response to another question, "I don't know anything about them; but I like them. It's sometimes easier to like things the more the less you know about them."

Then in reference to what I forget:

"The road's a bit rough outside; but I explained to a German visitor that it was a new kind of fortification we had devised to keep off visitors. I don't know if he believed me."

Shall I describe G.K.C.? I don't think I can. Only this much: a tallish, burly man; a shock head of grayish-auburn hair; a broad face, lighted by the keen, inquiring eyes that peer through glasses, very searchingly sometimes.

Our Government and Business

Centralizing Economic Power—Some Aspects of Mass Production

By HUSTON THOMPSON

Copyright, 1925, by Huston Thompson. All rights reserved.

This is the second of a series of informative articles on Our Government and Big Business.

THE modern business disease of centralizing economic power in a combination of competitors and price fixing or controlling is not confined to our country. From practically every civilized nation comes the report that it is suffering from an era of combinations and price control. The reaction and fretting peoples is agitating the various parliaments of the world.

In our country this economic movement is moving like a snowball rolling downhill, despite the fact that we have for twenty-five years been struggling to recover control of ourselves since the last great era of combinations.

Many professional economists whom one meets toss the whole question off lightly with a statement something like this: Mass production is an essential of modern times; mass production is predicated upon combinations; combinations are efficient: hence we must have combinations.

They do not stop to consider that *the greatest and most successful mass production output of today is frequently accomplished by corporations that have never swallowed a single competitor, and are not combinations,* and do not indulge in price fixing.

How About Pacifying the Consumer?

Let us assume, however, as some of the "special interests" and professional economists do, that great combinations and price-dominating groups, over which states have little, if any, control, since they are doing an interstate business, are inevitable. Likewise let us take the next step with them and admit that the Federal Government must devise some way of regulating them so that the housewife, the farmer, the artisan, or the ultimate consumer, who are the purchasing public and hence are the geese that lay the golden eggs for the seller, must be pacified. What shall we offer as a solution?

To put the problem in our own language: Since there is no escape from centralized Federal Government, if we permit price-regulating associations that destroy competition in price, or a centralization of economic power in business combinations built up by merging competitors into one great corporation beyond state control, how shall the Federal Government regulate them?

The answer is easy for those combinations which are already entrenched in the business world. Though they hold up their hands in holy horror at bureaucratic government one moment, yet in the next they ask for legislation that will give some governmental organization power to advise them before they undertake to carry out a plan or project. This they have put into a phrase which they call "ruling in advance." This is the smoke screen behind which they hide when they have perfected their combination and public pressure is felt.

They say to the public or to the legislator, "Let us be advised in advance of our actions as to what we can do." They do not add, "And we shall obey." Of course, if they are to be advised they must obey, else governmental advisers would be put to an immense waste of time.

Before I came upon the Federal Trade Commission I firmly believed that it would be possible to have a business lay its plan before the commission and be advised in advance. I did not then know that there were more than 200,000 corporations and approximately 4,000 trade associations whose members were doing an interstate business. Nor did I know that thousands, if not all of them, had problems about which they wished to be advised and which, under such a system, they would have the right to submit to the Federal Trade Commission for advice in advance of putting them into action.

I soon discovered that this thing of advising business in advance was not only impossible, but that if it were to be attempted with efficiency it would cost the government a tremendous sum, add thousands of employes, create additional bureaucracy, and (if the decisions were enforced) interfere with and slow up business beyond the flight of one's imagination.

One of the very first problems presented to me in the Federal Trade Commission seven years ago was what has since become known as the "pump and tank cases." These "pumps and tanks" were being installed by oil companies on the curbs and premises of storekeepers and garages in return for a nominal consideration, generally one dollar. The contract between the company and the storekeeper or garage had a clause that no gasoline except that of the installer should be contained in the tanks and distributed through the particular pump. A complaint had come to the commission from many Independents and small oil distributors which charged that the larger companies could and were putting the smaller companies out of business which the latter could not afford because of the large investment required to pay the approximate cost of from $300 to $500 apiece for such "pumps and tanks." They asserted that they were losing customers and that their means of distribution was being cut off and competition destroyed. At that time the record showed that very few of these retail dealers were using more than one pump and tank.

A previous commissioner, with the assistance of several attorneys, seeking to accommodate this industry, had been struggling over the form of a contract of one of the large companies for the purpose of eliminating, without a contest, language which the commission considered objectionable and which was causing the closing of the avenues of distribution to the Independents. For almost a year the former commissioner had sought to be of service to the oil company, but each time the contractual language was objected to by him the company brought the contract back for approval of sentences substituted by it in lieu of the former wording. The language was still being debated when I was appointed to the commission. In despair my associate passed the problem over to me and I struggled with it for several months. During all this time the giving away of pumps and tanks was going on.

A Commission and a Contract

Finally, I saw that we would never come to an agreement, so a complaint was issued and the cases were tried. An order to do away with the practice was issued, and some of the companies appealed to the courts. The latter, for reasons which have been stated in their public opinions, ruled against the commission. *It is interesting to know that representatives of a number of the companies have since expressed the wish that the commission's view might have prevailed, since the practice has become very burdensome even to the strongest companies.*

I have cited this illustration for the purpose of showing the difficulties in the way of a public official trying to advise business in advance. Since that first case, I have had similar experiences, and almost invariably like results. Now, instead of being an advocate of advising in advance, I am convinced that (Continued on page 4)

Our Government and Business

(*Continued from page 3*)

it would be impracticable and unfair to require a public official to consider the intricate, and sometimes unheard of, problems of thousands of corporations and trade associations, in advance of their being tried out under rules that require testimony to be taken. Such practices cannot result in anything but failure.

Limitations of Public Officials

To be capable of ruling, the official would often have to be conversant with the psychology of the applicant's mental processes, often with his financial situation, his moral probity, and many other functions of his mind. Frequently a business group has presented a plan which on its face appeared lawful but which was susceptible of two meanings. The one seeking advice might at the moment intend fully to carry out the plan, presumably intended by the language. What he considered at that time the only right and proper method might be changed in six months by financial pressure or circumstances over which he had no control. At the end of that time he might read into the language another possible plan of action.

Again, the concealments of language are used by some business groups to accomplish that about which they are doubtful.

Moreover, public officials, not being endowed with second-sight any more than many in the business world, frequently cannot guess how a scheme or plan, which is apparently lawful on its face, will work out—that is, they cannot tell whether it will eventuate into an infraction of the law.

The Federal Trade Commission has done its utmost through studies which it makes upon the request of Congress, the President, or the Attorney-General, to assist business in meeting economic problems. From these studies the commission makes recommendations which Congress can follow, if it sees fit, by legislating. Or it can investigate further before legislating. These investigations of the commission often cover a period of more than a year and employ the time of many men and cost many thousands of dollars. Even then they are not based upon the examination and cross-examination of witnesses under oath which might frequently change the entire complexion of the *ex parte* statements or opinions of people.

Back in 1919 and 1920, when the business world went mad over higher prices and the cost of living soared until there came the Buyers' Strike, the commission was in the very maelstrom of this business vortex. The members of the commission were watching intently what was going on. From their experience, derived through following the market from many angles and investigating the correspondence of many associations and other groups, they saw the situation and knew that we were facing an inevitable slump or crash.

In the business world there were about that time a number of manufacturers in many industries who were involved in what is known as "the guaranty against decline in price." In this practice the manufacturer agrees that, if he should reduce the price of his product at a date subsequent to sale and delivery of a bill of goods, he will pay to the jobber for the goods on his shelf the difference between what the jobber paid and the manufacturer's reduced price.

This practice was so prevalent and there was such agitation about it in the business world that the Federal Trade Commission called together more than 350 manufacturing and selling concerns, including trade associations. The hearing lasted for several days, during which time those for and against this practice expressed their views in an *ex parte* way and not under oath to the commission. There was intense earnestness on the part of all. Undoubtedly all were expressing their honest views.

When the Buyers' Strike came many manufacturers who had formerly been in favor of guaranteeing against decline in price changed their views when they were called upon to withdraw from their resources and to hand over to the jobber hundreds of thousands of dollars which they desperately needed. In fact, some of the manufacturers went into bankruptcy because of this practice.

When Jobbers Capture the Profits

At the time of the hearing which the commission held, the following were some of the complaints made against the practice:

That it tended to produce overbuying and speculation on the part of the jobbers who purchase more than they would on a purely price competition basis;

That manufacturers would not drop their prices until compelled to if the jobbers were holding much of their products, thus artificially making for higher prices than supply and demand justified;

That on a rising market the jobber, and not the manufacturer, got the profits for the goods and therefore the jobber should bear the loss on a falling market;

That manufacturers did not get any guaranty on the raw materials they purchased for their products, while they were put to the expense of providing for funds necessary to meet a possible decline in the price of their manufactured article;

That this expense was added to the cost of the manufactured article and eventually paid by the ultimate consumer;

That the practice put a premium upon business ignorance, inefficiency, inexperience, and incompetency to the detriment eventually of the ultimate consumer;

That it gave a large manufacturer a decided advantage over a small one who might not have as large a surplus for emergency, but who was otherwise a good and efficient merchant;

The Public and the Retailer

That it produced sales of a product more on the basis of the manufacturer's credit than on the quality of his product;

That one manufacturer guaranteeing against decline in price forced the entire industry to follow, since the jobber would patronize the one who offered guaranties;

That no benefit accrued to the purchasing public since the retailer, on a falling market, moved the goods on his shelf first, these goods having been loaded with their part of the overhead expense of the guaranty from the manufacturer to the jobber;

That under this system the least progressive and most speculative jobber benefited the most as he got the largest rebates;

The final cost of all rebates paid by the manufacturer fell upon the consuming public;

That since the practice encouraged over-buying it brought on a reaction in the form of a slump, thus producing over certain periods of time an unstabilized market, and that it caused an increased number of failures, thereby wiping out many competitors who had to pay rebates on a falling market and who had been forced into the practice against their will.

Could a public official confronted with the *ex parte* statements of those interested in this practice, either for or against it, tell in advance whether he should approve the system of guaranteeing against decline in price? It must be obvious that a method of this kind can only be tested by the taking of testimony in each individual case.

From the rulings in such cases there should be eventually acquired knowledge of whether the system is economically wrong, or costly to the ultimate consumer and hence against public policy.

(*Concluded on page 25*)

What Is an Intellectual?

By THOMAS L. MASSON

Every intellectual knows that his "appeal" is limited and that his only chance to build up any kind of a permanent trade is never to forget his pose.

FOR a number of years I have wondered why it is that no writer, apparently, has had either the initiative or the courage to define that species of human being now somewhat popularly known as an intellectual. Some years ago, in quest of material for my own public, I wrote to a well-known woman writer, herself a full-fledged representative of the intellect, requesting her to write an article about intellectuals. She was known then as a "highbrow," a term now going out of use, and was the author of many reflective essays and stories of a very superior order. Being somewhat on the inside, I knew that this woman was not averse to accepting good money, and I was prepared to pay her double what she was in the habit of receiving—for her work was so precious (as they say in French, *a precieuse*) that it was limited to a few highbrow magazines. For instance, she was glad to receive seventy-five dollars for a story which, in the circle of intellectuals, was recorded as a masterpiece, whereas low persons who were popular were getting all the way up to a thousand. This woman scorned me, and for a long time I couldn't understand why, until it occurred to me that there is not only honor, but business among intellectuals. Since then I have discovered that the intellectual pose—sad as this may seem—is almost altogether based on business principles. An intellectual may be defined as one who is educated, but not intelligent. This is perhaps a little rough, and not strictly accurate, but as Shakespeare once remarked, " 'Twill answer." To illustrate: a young man I have known for a long time, and who undoubtedly comes under the classification of intellectual (although he is a very human and genial person now), once secured a position with a woman's magazine of large circulation. After he had been there for some weeks, he went to one of the editors one day and said he had an article which he thought the magazine might like to print, but was in some doubt as to whether it was suitable. The editor, in reply, said: "Why don't you ask your wife to read it? Being a woman, she will probably be able to tell you whether it is right for our magazine." The young man smiled loftily and replied: "Ah, but you know my wife never reads your magazine." He did not stay there so very long afterward. This little episode, if we happen to be in "society," would be classified as a lack of tact. But among editorial cave men it is known by the phrase "not all there."

Still we must always make allowances. So far as base coin in quantities is concerned, every intellectual not only knows, by a sort of instinct, that his "appeal" is limited, but that his only chance to build up any kind of a permanent trade is never to forget his pose. One of the most distinguished intellectuals in this country, a tart critic who has acquired an international reputation, wrote in his beginning days a book of silly verse, reeking with soft sentiment. A friend of mine, himself one of the most polished poets in this country, who has a horror of anything resembling affectation, came across this little volume by accident. He pounced upon it, seeing its possibilites, copied off some of the verses with the author's name and, adding a few nice comments, sent it to a newspaper.

There is in every community, no matter how small, one or more intellectuals.

It is almost needless to say

(Continued on page 29)

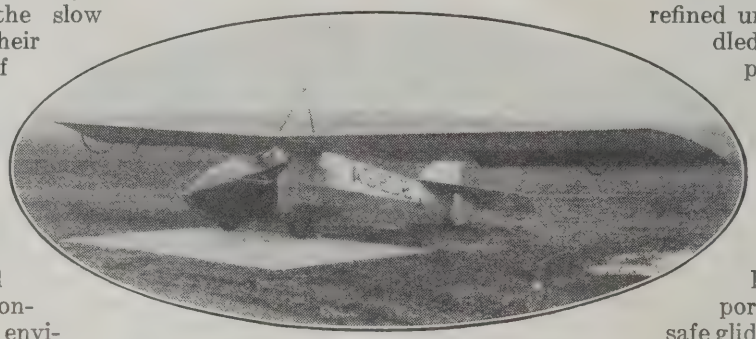
The Human Race Will Grow Wings

Factor of Evolution Tending Toward Wings About to Appear

By CORLEY M'DARMENT

AS LIVING creatures swim, crawl, walk or fly down through the ages that compose eternity, the slow grist mill of Nature changes their forms to suit the necessity of environment. No living thing can escape change, which is another name for evolution.

Modern man has hurled himself into the air on wings of cloth and with an engine of iron. He has created a comparatively new environment for himself and this new environment is very likely to become a necessity, and if it does, the human body will respond, and, in time, fit the surroundings with natural attributes of physical growth. The ancestors of men once flew. The desire to fly is perhaps inbred in the race and is but a long forgotten memory of the days when heavy winged pterodactyl ancestors beat the air over Mesozoic lakes. In the modern airplane scientists already see a weapon, or rather a factor, that can easily lead man back to natural wings and still retain his superior mentality. The present type of airplanes will not aid natural growth of wings but they have opened a way. The way this will be accomplished is not extraordinary nor does it take any stretch of imagination to see it; already it is peeping over the horizon of the future. The fact is that man once having succeeded in launching himself into the air will exhaust every energy and resource to keep himself there. He has struggled too long to release his hold upon this ancient dream now come true. The end of resources in the form of fuel for airplane motors is in sight. Thirty years will perhaps see the beginning of the end of gasoline motors. Then man will be required to depend upon his natural energy for flying. The faith that energy will be taken from molecules when oil runs out is based largely upon hope. But more will be said of this later. The recent development in motorless airplanes is a step very little beyond powered machines, but the little gliders, combined with the priceless secrets learned in aerodynamics, will surely produce a race of highly intelligent creatures with wings on their bodies. It may take a million years for this to take place, but a million years is only a moment in eternity.



Official photograph, U. S. Army Army Service.
A small glider that will carry an aviator higher than his point of departure in the air.

The discovery in aerodynamics that made flying possible relates to the use of elevators for acquiring and maintaining longitudinal stability of supporting planes in the air, and to ailerons which keep the lateral stability. With the application of these two elements, men can balance themselves in mid-air by manipulating levers. The rush of air beneath the planes or wings supports a weight, and the faster a plane surface moves through the air, the greater weight can be supported. By experience in flying, it has been learned that this extra "lift" can be given a plane by diving it through the air and the dive can be controlled by means of the elevators. Learning how to control this dive is probably the greatest discovery ever made in the history of science. But this diving in mid-air would be dangerous indeed if the diver should turn over, but the wing "warping" idea conceived by the Wright Brothers a few years ago has been refined until now ailerons rightly handled will absolutely prevent a plane surface from turning over in the air.

Knowledge combined with experience in using these ailerons and elevators makes it now possible for a man to leap from a high place like a tower or hilltop with very small supporting surfaces and maintain a safe glide, or in a wind, even rise above his starting point, as has been demonstrated in numerous gliding tests. It is the knowledge of flying principles that has made late gliding experiments so successful. But instead of using a glider built upon the conventional airplane lines, a supporting surface can be built around the human body like the wings of a bat and by using the forearm webs as ailerons and the supporting surface between the knees and feet as elevators, a skilled aviator who has also had enough experience in parachute jumping to keep his head, could leap from a high point like a tower or an airplane and "pilot" himself to the earth in a glide. He would, of course, carry a parachute on his back for an emergency and to release before landing, to lessen the descent. The first few attempts with such a bat wing apparatus would not be much more than parachute jumping, in which the supporting surface would be "felt" out in the air for a few seconds before releasing the parachute. Then as experience is gained, the glides before opening the parachute would become longer and longer until release would finally be made relatively near the ground.

It will be remembered that many early attempts were made to use supporting surfaces like bat wings by men in efforts to fly, but in most cases the results were tragic and the would-be flyers "fell and broke their bones," as one ancient record states. But the failure of the pioneers was due, not to the principle of the supporting surfaces but to a lack of knowledge of the fundamentals of flying which every aviator now knows and uses. This main principle is that stated, pertaining to ailerons

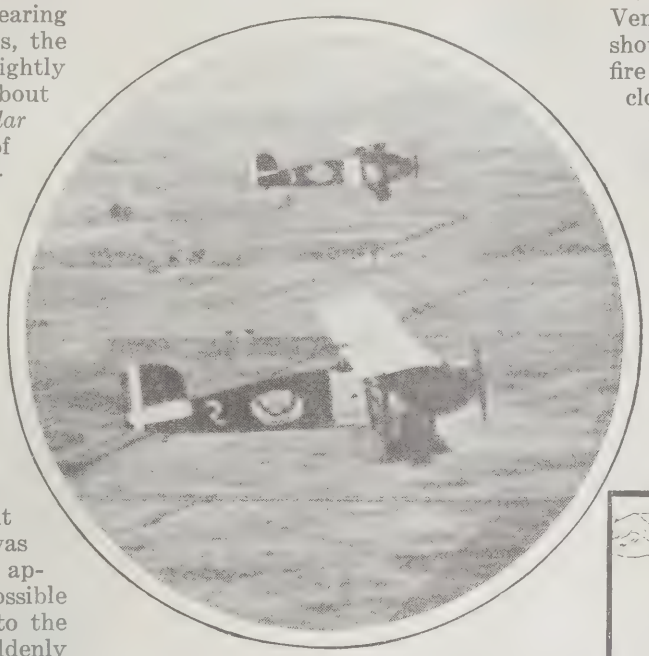
Official photograph, U. S. Army Air Service.
Parachute trials require a peculiar form of courage. No army parachute has failed to function and scores of aviators have saved their lives by using the device, which now must be carried by every government aviator.

nd elevators. Orville Wright has said hat a modern airplane could not have een flown by himself nor his brother n the early days of their experience ecause present-day aviators have rown to the modern machines by de-rees, through actual practice in flying he types leading up to them.

The figures on the bat wing support-ng surface mentioned show something emarkable. If the apparatus, made preferably of light parachute silk, be astened to the hands and feet of a man of average size, the total support-ng surface including the chest and abdomen of the wearer, will be approx-mately twenty-two square feet when ully extended. If the person wearing he apparatus weighs 150 pounds, the oad per square foot would be slightly ess than seven pounds. This is about *ne-half as much weight as regular irplanes carry* per square foot of ving surface. The airplanes fly-ng around the world are oaded to about twelve pounds per square foot and most racing planes are loaded to about ixteen pounds. With this ow loading ratio a very slow glide could be maintained with he bat wing apparatus. But here again skill by actual use must be obtained. The figures how the feat to be entirely practicable just as they showed he possibility of airplane flight ears before any actual flying was done. As skill in the use of the ap-paratus is gained, it may be possible or an operator to swoop close to the ground with extra speed, then suddenly pull up and make a "pancake" landing at very low speed as is often done with airplanes, and after skill is acquired in his, parachutes may be entirely elim-nated. Birds always alight this way. At this point the real evolution of wings on human beings will begin. In the absence of motor fuel, this light appa-ratus will be worn for safety in jumping rom the gliders which will be riding he charted air currents and the appa-ratus will be used for sport purposes and for light useful flying in good winds. Gradually a sense of the air and a flying "feeling" will develop. The cat is not et far enough removed from its flying ancestors to lack the "upright feel" in he air, and if this animal be thrown nto the air in any position, it usually squirms around and lands on its feet. Skillful stunt flyers of today have developed this strange feel in the air, and are able to orient themselves with ittle difficulty; and the ease with which this ability is acquired, after a ew months' practice, indicates that he human race has not entirely lost ts flying "memory."

After long use with the bat wing lying apparatus, the human body will n all probability begin to undergo slow but certain changes. The abdomen and chest will get flatter; the arm and leg muscles will become flattened due to the pressure of air upon them and the head may become a little more pointed and the ear lobes will disap-pear as they have done on fowls. The pressure upon the abdomen and chest will cause the skin to flatten on the sides of the body and become extended tissue. The same will happen to the legs and arms.

There will be prenatal influence, too, for as many women will fly as men, and the instinct of balance in the air and the feel of a lifting surface for air buoyancy will be transmitted to unborn infants and after several genera-



Official photograph, U. S. Army Air Service.
Army airplanes on the flight around the world were loaded to about twelve pounds per square foot of lifting surface.

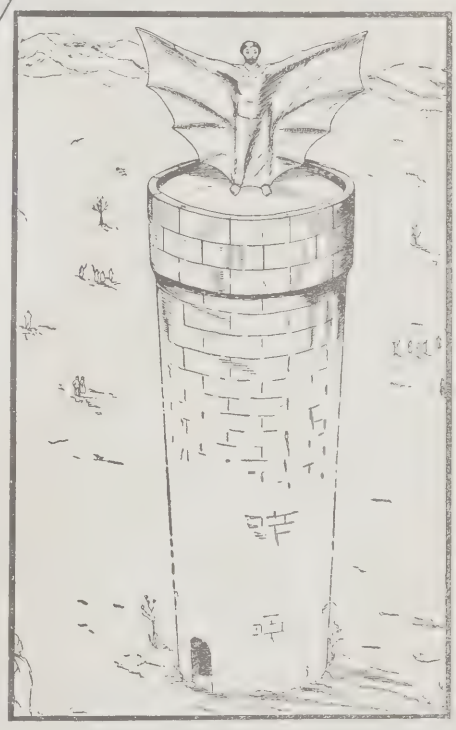
tions a semblance of tissue extension might be expected upon a few infants. A considerable change in bodily con-formation would also occur with chil-dren in their teens who would be flying while growing, and upon reaching full growth would have flying characteris-tics. Children would find gliding in the air great sport, and a flying instinct would develop that can scarcely be comprehended today for human beings.

If a new source of energy should be discovered about the time the present form of fuel is exhausted, the evolution of wings will be delayed until either the new form is also exhausted, if such be possible, or some cataclysm should occur and destroy the race before the development.

The possibility of deriving energy from molecules or atoms may never be realized. Or, if suddenly found and released without control, it is very probable that the concussion would extend to every other particle of mat-ter upon the earth and cause the whole world to explode. We may now be witnesses to such disastrous experi-ments. The new stars or "novae" which spring into sudden short-lived brilliance may be caused by collisions as is thought, but also they may be due to experiments of highly learned in-habitants who upon discovering the secret of molecular energy suddenly brought about their own destruction and that of their world. The disap-pearance of some of these new stars appears to lend evidence to the explo-sion theory, for in a collision of two bodies they would be apt to remain longer as a large glowing mass. In an explosion, the bits of the body would burst into flame and fly off into space, where they would soon cool and become invisible. If the inhabitants of Mars, Venus, or one of the other sun's planets should suddenly burst out as a ball of fire and no other heavenly body were close enough to collide with it, a plausible theory would be that the inhabitants had discovered the secret of releasing molecular en-ergy and, being unable to govern it, had burst their planet asun-der.

Indeed meteors which strike the earth bear a strange resem-blance to chunks from another world like this one.

Thus if some inexhaustible source of controlled energy is not found, mankind will be



Official photograph, U. S. Army Air Service.
An apparatus similar to that shown above, made to fasten around the hands like a glove and around the feet like a shoe, will, when fully extended around a normal man, afford twenty-two feet of lifting surface.

forced upon his own natural and elementary resources to keep him in the air, and this will lead not *back-ward* to clumsy pterodactyls, but *for-ward* to agile-winged creatures with mental abilities far beyond modern conception.

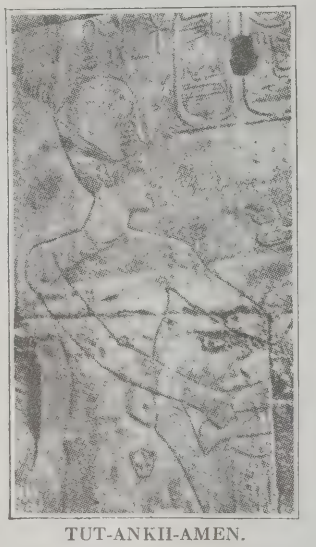
A Day in Cairo

By LEONORA RAINES

THE sun celebrates the opening of the season by declaring a strike. Egypt, tired of her cloudless sky and powerful sunlight, like a spoiled child, is bucking at routine. Previous to this winter, the air was always the same, gloriously warm and balmy. Seasons are shifting here as elsewhere. Built without chimneys, the houses are not comfortable, so like other visitors we go out for a promenade and use the sun as a pulse-warmer.

Being acquainted with Arabic, and having been in Cairo before, we shake clear of the dragomans who crowd about us thick as flies. Leaving our carriage at El Azhar, we visit the old part of town and saunter along the Tarbihah, and in lanes so narrow that a baby kitten couldn't swing in comfort.

New Cairo is the world of the quick. Old Cairo is the world of the dead. But it is a world of a dead so full of life and emotion that we'd never like to see the new again. It is the Arabian Nights all over, with not a character or color missing.



TUT-ANKH-AMEN.
A portrait of the great king, as a bas-relief decoration of Luxor temple.

The beggars and blind are as numerous as a thousand years ago. The veiled women are fawns in grace, and each step and gesture is that of a dethroned queen. Emaciated forms caressed by flowing rags that fall in lines of beauty.

Now for the House of the Bookbinder!

Of course, no bookbinder ever had anything to do with building such a bijou. The place belonged to a grandee, but when Old Cairo was no longer a residence for nobility, the Pharoah fled, and then the workman got ownership. A complaisant Arab who is caretaker shows us around, and when we reach the court, bows us to his harem.

The law allows him four wives, but he has only two. The two and their sets of children wallow amiably in the dirt. The women smile as they rise to salute. Their skin is like parchment, their eyes bright and appealing. Their bodies are bent in two, yet neither I am sure is more than thirty.

With a dramatic gesture, the husband exclaims, putting his arm over the shoulder of one wife, "This one I married when she was eleven years old."

She glides away, and the other steps up sweetly.

"This one I married when she was twelve."

With pride and possession in his voice, he embraced the second. The women, who do not appear the least unhappy, smile approvingly, and the first uncovers her one front tooth. The second uncovers gums that have no teeth at all.

In all countries children are charming, and even in Cairo which seems to have gathered the dregs of humanity together, the little ones are very winsome. They grin through coatings of black dirt, then stand with bowed heads waiting for the baksheesh which experience has taught them will fall into their willing little hands.

A baby is sleeping in a wretched room on a pallet. Flies swarm, and about the tiny head is a mass of them which centers about the eyes. My friend and I exchange glances which say, "Another candidate for blindness."

Before we leave the court, a Nubian with a goatskin enters, and we halt to look. The skin is carried on his back and seems stuffed with sawdust so rounded is the shape. This man is bringing the daily supply of water to the family. The water is emptied into grimy jugs, and the amount, which probably measures a gallon, is paid for in milliemes.

We stroll to Ataba-l-Khadra to see the school in Koran. It is here that the students are doing their "thirty-seven-year" course in expounding the text. There is great babble and confusion, but the noise does not prevent passing Moslems entering the latrine behind the mosque washing face, hands, and feet, and finding a place on the floor of the temple to throw themselves down in prayer.

All worshipers are men, for in this country women are considered unfit to pray in mosques. In fact, Mohammedans dislike to see women pray or occupy themselves with religion. There are feminine organizations at work and there is an American mission here, but when it comes to exterior influence the Egyptians, Copts, Mohammedans and Jews are true sons of the desert, and the advance of women is slow.

We pass an alley leading to an ancient mosque, and step in to take a peep through the open ports. A youngster spying us, calls, "Stop! It is forbidden!"

He runs up, menacingly.

"As unbelievers you may enter, but first you must take off shoes or wear slippers that have trodden nowhere else. A mosque is sacred."

A policeman appears and wants to know what's the matter.

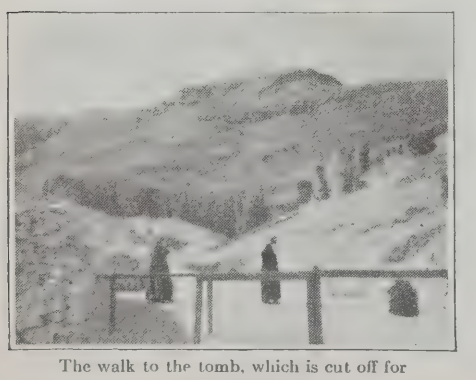
"I beg you to pardon the rudeness of the lad. But he knows that Allah would not be pleased if you enter as you are."

A curious crowd is collecting, and we hurry away. Cairoites regard strangers as both Croesuses and madmen, so unintelligible to them are the reason and pleasure of sight-seeing.

It is Friday, the Mohammedan Sunday, and after tiffen—as lunch is called in the East—we hurry to see the dancing dervishes. It is one of the religious sights. The rite is performed by devotees—students and patriarchs. I am told that some of the wealthy sheiks are among the performers. They are all equally ungainly, but their dance is unusual. The orchestra, a drum and fife, plays ever the same strain, which after each few bars, flourishes into a wail. The young men whirl so fast that their galabiehs stand straight out—a caricature of the ballet dancer. The old fellows whirl as fast as they can, but their skirts hardly get high enough to expose their sticks of legs.

In the shadow of Tut-ankh-amen's tomb.

We had fled the European side of town because of its cheapness and ugliness. Now we are glad to get back to red tiles and corrugated iron. The dust is frightful, but with all its unattractiveness, here it is at least less heavy with stenches. The old town is a sink, but a sink that drags money, and wise heads know their business in preserving the muski, the souk, and the odors. Wipe out Oriental Cairo and this part of Egypt would be closed to travelers!



The walk to the tomb, which is cut off for conveyances.

Editorials

A New Dress —An Old Creed

WITH this issue THE DEARBORN INDEPENDENT changes its dress but not its principles. During the six years of its history as a weekly magazine it issued 327 numbers in the form by which it became well known to the country, but the inconvenience of that form has made a change desirable. Hence the present style which for modern typography, convenient size, as well as more important attractions, will, we are sure, commend it to its nearly three-quarters of a million subscribers.

The career of THE DEARBORN INDEPENDENT to this present 328th number has not been one of tranquil ease. We have undertaken to chronicle the neglected truth against all the force that organized alien power and prejudice could mass against us. We have survived the most vicious and prolonged campaign of misrepresentation probably ever conducted against any publication. And we have lived to see our truths accepted and made the basis of action everywhere. Which consummation, unless they were truths, could never have occurred.

It is now pretty generally understood that our policy has not been actuated by malice nor prejudice. The time had arrived in this country when the gag had to be removed and public opinion set free on certain questions of the profoundest importance to the nation. Questions which had long festered in darkness, and which were taking dangerous shapes because of the suppression of free speech concerning them, were brought out into the sunlight of frank and free discussion. And the result has been a national benefit.

Publications, unlike individuals, seem to have a license to praise themselves and laud their work, but this license THE DEARBORN INDEPENDENT has never used. Yet it is permissible, and therefore pardonable, that at this milepost we do set down the assertion that the causes we have fought for are on the gain all along the line, and that we do renew our pledge to the reading public to serve it where other publications cannot in the fair and exhaustive discussion of those matters which lie at the root of our national well-being.

We have set out to do a piece of work which has many ramifications. It touches practically all the vital departments of activity. Here it is an alien racial organization; there it is a faulty money system; yonder it is a subtle propagandic injection of subversive ideas into the public mind. But these of themselves are not the ultimate object. What is really sought is the liberation of those qualities which these anti-American facts are hindering. We seek as the main objects freedom of thought and speech, freedom of business, freedom from alien control of all the channels of intellectual expression and development which are necessary to the growth of the American soul.

We think that is a worthy goal worth all the labor it costs.

Lessons for Rulers

HERRIOT'S fall contains one lesson for European statesmen and one lesson for statesmen of every country and every time. The first is that no European premier can get by with deception because the facts will expose him. The situation in every country over there is so very bad that a new kind of fame awaits the man who will make the experiment of telling the people just how bad it is. Not even the Dawes plan guarantees, or even promises, or even asserts, that it will make conditions better. There has not been a single premier or dictator arise in Europe who was man enough to tell his nation the truth. It is all a policy of concealment. And of course exposure simply ends the farce.

The other lesson is the impossibility in these days of interfering with anyone's religion. Herriot deliberately interfered in Alsace and Lorraine, whether in hopes of creating a diversion or what not, and he failed. Silent resistance defeated him. He had trouble enough as it was, but he interfered with an established order of religious principle, which no statesmen, not even the all-powerful atheist junta of Moscow, can do. Any peasantry can defeat a religious bigot, be that bigot parliament, the premier, or the king himself.

Almost 100 Per Cent Efficient

SPRING is here and with it the ubiquitous dandelion. Though some admire, the very sight of it draws groans from an army of others.

It must be admitted, however, that, in the course of years of persecution the dandelion has won the respect of all. It puts up a battle for life that can scarcely be surpassed.

Against drought, and the most dogged gardeners, it has evolved a long tap root. It has gained ready control over its leaf and flower stems. When conditions are favorable they grow long and the plant becomes luxuriant; when conditions are sinister its leaves and flowers cling to the ground, almost stemless, so that neither lawn mowers nor the hoofs of animals can injure it.

Its leaves are serrate and can become very narrow when room is scant. The serrateness allows each leaf to share in the sunlight. The yellow blossom of the dandelion is not one flower that produces a few seeds, but is a composite of hundreds of flowers, each producing seed. Moreover, it develops, to protect the flower, a disagreeable taste, so that animals pass it by. Its seeds are winged, so that even under the most unfavorable circumstances some seeds from each flower find a safe lodging place. Not content with all this, the plant has so perfectly learned to balance its forces that each produces three crops of flowers in one season.

When the sluggard takes Solomon's advice and goes to the ant for instruction, many of us, during

the months to come, might meditate upon the little plant for which discouragement apparently does not exist, and learn of it some lessons about meeting difficulties with resolution and ingenuity.

Villas for Sale

FIVE of Newport's most palatial villas—the 110-room with private ballroom kind—are on the market. Five of them, all bearing names once mighty in American finance. Why? Well, some say it's because servants are so hard to find these days, and then so hard to keep. Others say it is because the second generation's income is not so large as fawthaw's was—for fawthaw worked, you know. Still others, of more genteel mind, say that society is becoming much simpler. Cutting out what may be meant by "society," it would be very hopeful if the latter reason were the true one. The old dowagers of the 110-room "cottages" were housekeepers, and had to be; but their daughters-in-law are of the club variety. And maybe clubs are simpler. Unless one is cumbered with a family; rather awkward to raise a family in clubs, don't you think? Anyway, there are five palaces on the block at Newport, and anyone can guess who will live in them next.

Tips for Textbook Makers

"A LIVE newspaper is better than stale history," says Augustus S. Thomas, Commissioner of Education for Maine.

Yes. There is more precept and incentive in a living Ty Cobb or Nurmi or Red Grange than in all the Athenian philosophers. More kick in General Mitchell, the stormy petrel of aviation, than in the ancient Icarus and his waxed-on wings. More romance in the American world-flyers than in Ulysses or Herodotus; more in Suzanne Lenglen than in Helen of Troy or Cleopatra. The Alaskan mushers carrying diphtheria serum to beleaguered Nome—this is a classic lacking only a thousand years of haze to make it Olympian.

Ancient history is good enough, if taught in terms of life and not as a look-see museum skeleton or mummy. But newspapers live.

No Special Treatment

SIR WILLIAM JOYNSON-HICKS, the British Home Secretary, recently had a passage at arms with a deputation from the Jewish Board of Deputies who called on him to demand special treatment for their co-religionists in the application of the regulations applying to aliens. Sir William made some fearless observations that are of special interest to Americans since Washington officials are constantly bedeviled with arrogant demands to set the immigration laws aside to favor the Jews.

In the first place, Sir William said he wished to make it clear that any country had a right to decide whether it would or it would not have aliens in its midst, and referred to America having exercised this right very freely during the last two years.

In regard to the deportation of undesirable aliens, Sir William put his foot down very firmly upon the request that a (Jewish) Advisory Committee to the Home Office should be set up. He said that the responsibility for the proper enforcement of the alien regulations would be borne by the Home Secretary.

As to naturalization, Sir William said that he regarded the gift of British citizenship as a very high privilege. If an alien, whether Jew or Gentile, who had lived here 15 or 20 years, who had brought up his family as English and learned the language—and especially if he had served during the war—desired to become a citizen of this country (Great Britain) there was no reason why he should not be naturalized and every reason why he should.

Rum Row News

THE *Saturday Evening Post* recently printed a piece of fiction concerning an American naval volunteer who became so disgusted with the insult to his country offered by the "rum row navy" that he bought an old submarine chaser (which was rotting at the docks), refitted her sufficiently for one cruise, sailed down "rum row," dropped depth bombs alongside every booze cruiser he passed, sinking the lot, while next day the United States rang with his exploits. It was a good enough story to be true. One thought of it when the naval airship *Los Angeles* sailed low over the rum fleet the other day, under orders from the Secretary of the Navy, and took photographs for future use. One thought also of Henry Ford's suggestion, made several years ago, that the rum problem would last hardly longer than overnight, if the Army and Navy were put on the job. Is Secretary Wilbur thinking of that?

And now comes the comforting word that Sir Broderick Hartwell's booze raid on United States shores has failed. This man used his parliamentary prominence to organize stock companies to run liquor cargoes to America and break the American laws! And he a baronet of Britain! Evidently he advertised too loudly, and now it is reported in London that our prohibition service, bad as they say it is, has cost the baron and his 1,000 stockholders all their profits and much of their capital.

It's a rum row that has no turning.

Knowledge the Fruit of Ignorance

AN INTELLECTUAL, says Tom Masson, in this issue, is one who is educated but not intelligent. No name has been invented for the one who is intelligent but not educated, probably because no such person exists. Intelligence finds for itself the things it needs to know, and often comes upon them from a more creative angle than if it scooped them out of the academic fact-trough. Milk-fed minds carry none of the world's burdens. *All knowledge is the creation of men who did not know, but soon found out.*

Mr. Ford's Page

ON A former Page it was asked why a generation that enjoys more leisure and opportunity than any preceding one should pity itself as being the hardest driven generation in history. It was merely a question. It was not asked in the hope of obtaining an immediate answer but in the hope of starting an inquiry. Why is it that with more time, less labor, more of the refinements and less of the pressure that our fathers had, we should keep repeating that we live in a time of ruinous and compulsory haste such as never was before?

It would be impossible to deny that we are moving fast. From a farm to a town which one knows one walked in other years, and the journey occupied four hours. Then one drove a horse and made it in two hours or better. Then came the motor car which, even in these modern days of congested traffic, covers the distance in twenty minutes. Today that whole distance is just part of an arc covered in two or three minutes by a departing airplane seeking its flying level. Certainly we are moving faster. Or, more correctly, are being moved faster. But is twenty minutes in a motor car easier or harder than four hours' solid trudging down a dirt road? Which mode of travel leaves the pilgrim fresher at the end? Which leaves him more time and more mental energy?

We dwell on a planet that drives at a terrific speed through space, but it is not nervously ruinous to let the earth carry us along. Speed must be counted in the scale on the side of man's service and comfort.

THIS so-called rapid pace at which the world is moving—is it hurtful or helpful? Do not too readily assume the former. We have become the victims of catchwords on this subject. It is not the ongoing but the backpull that wears. Our pace is set by human beings like ourselves. Those who keep step feel the pace to be natural. Progress is geared to every man's gait. Being dragged along is where the strain comes in. Keeping step is keeping fit.

Where, then, is the reason for the modern complaint? We may find a clue to at least one part of the answer by considering the class of people from whom the complaint comes. They are, for the most part, persons having little or no practical contact with life; that is, their business is to think (although it is perilously easy to mistake a succession of ideas, which everyone has, for *thinking*). They are professional people, writers, teachers, lecturers, reformers, so-called idealists, who formerly were able to wrap the world up in a convenient package of dogma, and who now find the world too big for their small packages. In trying to wrap it up again they become greatly flustered and wring their hands, crying, "This pace will kill us."

Now go to another class of people, those who are working with the actual things of the world, from the laborer traveling to his work on the street car to the young man who hops across a continent in a day. You will find quite a different attitude Instead of cringing away from what has come, they are looking with eager expectancy toward what is coming. Always willing to scrap today in favor of tomorrow. That is the blessedness of the active man, the man who is out in the field with other men, not sitting among last decade's books trying to fit the new world into the old molds.

Go to that laborer in the street car. He will tell you that just a few years ago he came home so late and so tired that he didn't change his clothes; just got his supper and went to bed. Now he changes his clothes at the shop, goes home by daylight, has an early supper and takes the family out for a drive. He will tell you that the killing pressure has let up. A man may have to be a little more business-like on the job than formerly, but the old endless exhausting drive has let up.

The men at the top, the men who are changing all these things, they will tell you the same. They are not breaking down. They are marching the way progress is going and find it easier to go along with progress than try to hold things back. And just there is a secret: those who get headaches are trying to hold the world back, trying to wrap it up again in their small definitions. It cannot be done.

So, when well-dressed persons with no particularly constructive work complain about the pace of life (their own being very easy) it suggests that maybe we have been listening to the wrong group. This may prove to be a clue worth following up.

There are those who grant the greater physical ease of life but say that the nervous wear and strain has increased. This is a statement somewhat more in accord with the facts, but it cannot be allowed to pass as final. For a long time the public mind, which means the average mind, was merely vegetative. It knew and cared little beyond the daily routine. It thought what it was told to think. There was nothing new to speak of, and the chief exertion of humanity consisted in maintaining things as they were.

Then along came a time which fairly sparkled with magical wonders, not afar off, but within the reach of all. So many wonders, indeed, that we have all but lost our sense of wonder; nothing seems wonderful to anyone any more. And all this probed the average mind, jarred its lethargy, disturbed its quiet, forced it to enlarge its bounds, compelled it to contemplate new worlds. As someone has said, the reader of the evening newspaper (Concluded on page 31)

Mapping the Mississippi Valley

By LOUIS C. KARPINSKI

THE Mississippi River and its tributaries are the great arteries upon which the life of the United States depends. Food and transportation are made possible by this great river system ministering to a region larger than all Europe except Russia. Just as the history of the world is largely the history of the great river valleys so the industrial history of America centers now around the Mississippi Valley and the Great Lakes.

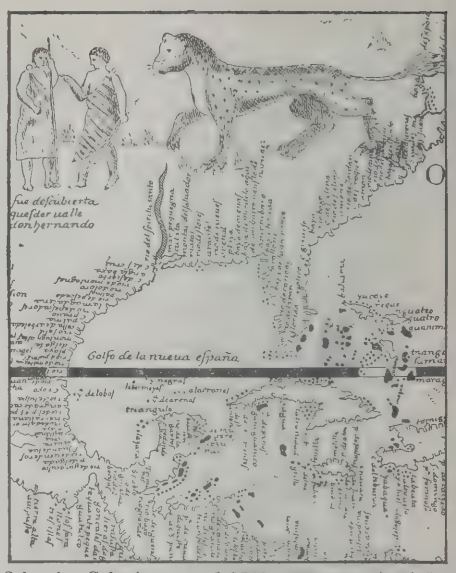
The ancient delusion of a passage to the Isles of Spice was, in part, responsible for the first voyage which placed the Gulf of Mexico upon the map. Numerous Spanish expeditions were being made to the mainland in the early part of the sixteenth century. Balboa, in 1513, first looked upon the Pacific, crossing over in the neighborhood of Panama. In the same year Ponce de Leon sought in Florida, as many do today, the fountain of eternal youth. In 1519 the Governor of Jamaica, Francis de Garay, dispatched four ships under Alonzo Alvarez de Pineda to discover some strait in the mainland.

This expedition of Pineda was the first to place the Gulf of Mexico upon the map and the first to indicate the Mississippi River.

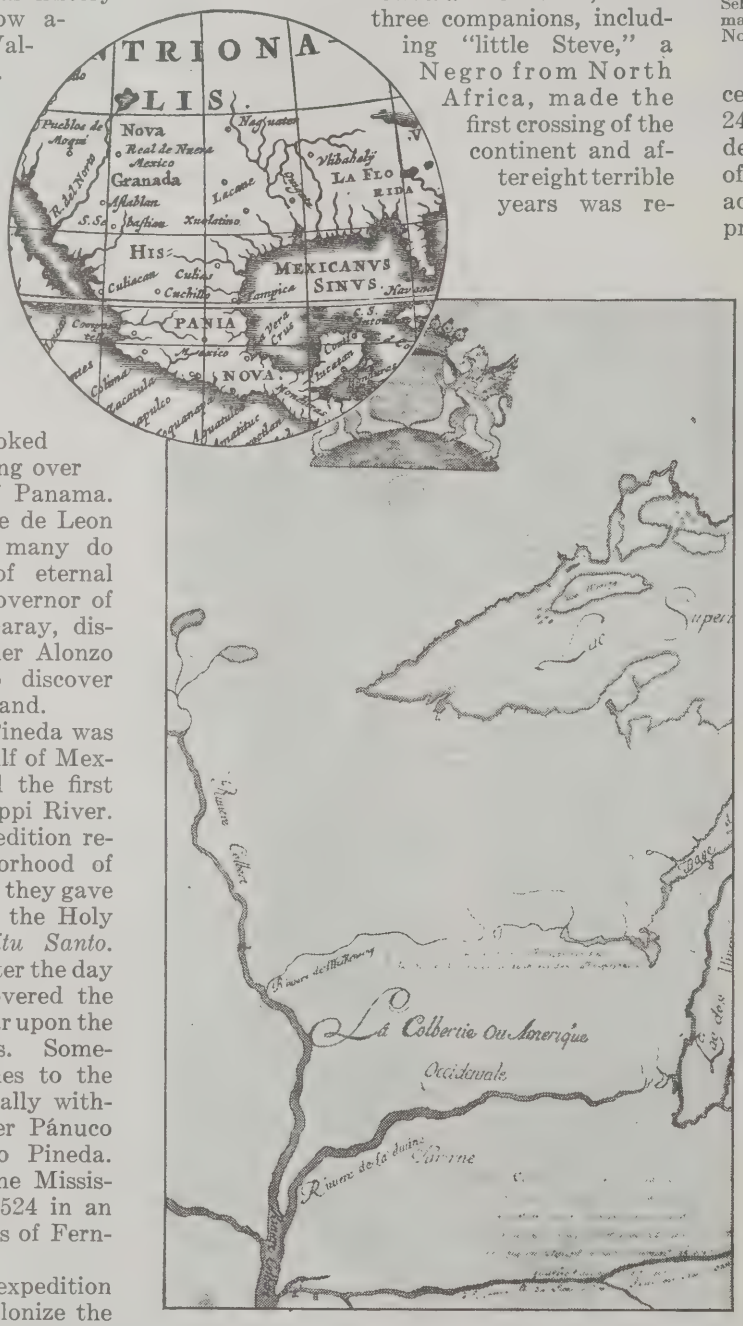
Forty days the expedition remained in the neighborhood of the Mississippi to which they gave the name the River of the Holy Spirit, *Rio del Espiritu Santo*. This name, probably after the day upon which they discovered the river, continued to appear upon the map for two centuries. Sometimes the name attaches to the bay, indicated occasionally without a river. The River Pánuco also owes its name to Pineda. Upon a printed map the Mississippi first appears in 1524 in an account of the conquests of Fernandez de Cortés.

In 1527 another expedition sailed from Spain to colonize the regions visited by Pineda. The commander Panfilo de Narvaez was entitled Governor of Florida, Rio de Palmas and Espiritu Santo. Six hundred persons started on this most disastrous expedition. After desertions and shipwrecks, three hundred men and forty horses were landed upon the coast of Florida. Of this great group only five were destined to return to the Spanish settlements. Narvaez perished with many others near the mouth of the Mississippi.

Cabeza de Vaca, with three companions, including "little Steve," a Negro from North Africa, made the first crossing of the continent and after eight terrible years was received by Cortés in Mexico on July 24, 1536. Time tempered to Cabeza de Vaca the terrors of the eight years of starvation in the wilderness. His accounts given by formal report, by printed book (1542), and personally to the Emperor and others, in Spain in 1537, excited the interest of able Spaniards. These romances were largely responsible for De Soto's enterprise.



Sebastian Cabot's map of 1544 represents the information about a river, obtained by Pineda in 1519. Note the river enters the Gulf in approximately the correct place.



Oval—Blaeu's map of the Gulf of Mexico. No particular advance on the Cabot map of the Mississippi region is shown. Below—Joliet's map of 1673. From a manuscript map in National Library at Paris; obtained through the courtesy of the William L. Clements Library of Ann Arbor. This map appeared in an early edition of Hennepin's voyages but was replaced by an incorrect map due to an error made by La Salle.

Estavanico, the Moor, later returned to touch the Mississippi Valley with another expedition and perished at the hands of the Zuni Indians. To this day these Indians relate that a black man came first to them, whom they killed; and that this black man was followed by the white men.

This Indian legend indicates how information was communicated by Indians to each other in story and in legend. The white men by friendly converse with the Indians learned many details of American geography and on the early maps such information is frequently reflected in regions to which white men had not penetrated at the time of the making of the maps.

The gold of the Incas enabled Hernando de Soto to associate his name and fame and his tomb with "the father of waters." Having established a reputation in Peru as one of the bravest Spanish captains, De Soto returned to Spain and received in 1537 the governorship of Cuba with the authority to "conquer, pacify and people" the territory from Florida to Texas.

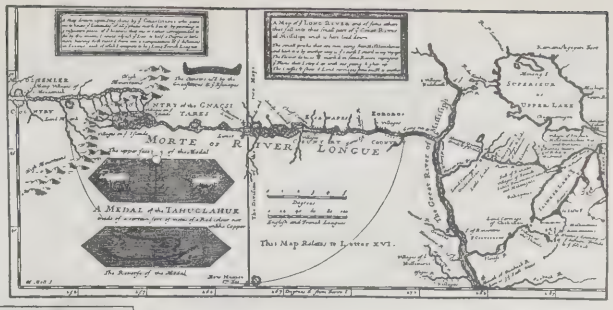
His great expeditionary force consisted of more than six hundred men and more than two hundred horses, together with cattle and swine. The paraphernalia for the service of mass was included and also armor, chains for cap-

tives, ferocious dogs to tear the savages to pieces, and iron collars for these captives. All of these instruments were used. On May 25, 1539, De Soto landed at Tampa Bay. After many vicissitudes and long wanderings in the interior, the Mississippi was reached in the spring of 1541. More than a year was spent in the western valley of the river. But the gold to rival Peru that De Soto sought was not there. A watery grave in the Mississippi (1542), this was the reward of an able but cruel commander who, beguiled by gold, neglected great opportunities to colonize fruitful regions. The survivors, about three hundred in number, constructed boats and came down the Mississippi and along the coast to Pánuco.

With De Soto ends the natural attack upon the Mississippi from the south. De Soto's elaborate expedition added little precise scientific information concerning the regions traversed. However, the expedition did place on the map numerous other rivers flowing into the Gulf of Mexico. The first circular gulf appears in the accounts of the conquests of Cortés published at Nuremberg in 1524. More than one hundred and fifty years elapse before any maps appear which indicate the river with its tributaries and the great inland territory which this system renders fertile. Had there been geographers and scientists instead of cavaliers and courtiers in De Soto's retinue the importance of the river would have been divined.

About the time of De Soto the French had made a beginning in the St. Lawrence Valley. The great Champlain in the early seventeenth century founded real colonies. From these colonies the French priests and traders united to place the Great Lakes upon the map. The fame of the Mississippi had been spread by the Indians and it is probable that before 1660 French traders had penetrated to the river itself.

The real discovery of the inland waterway must be credited to a native Canadian trader and woodsman, Louis Joliet,



Lahontan's famous Long River, which frequently later connected the Mississippi with the Pacific Ocean.

First map in print with the complete Mississippi. Based on the voyage by Joliet and Marquette.

and to his companion, the Jesuit, Père Marquette. In the spring of 1673, Joliet and Marquette, proceeding by way of Green Bay and the Fox River, crossed the divide between the Great Lakes system and the Mississippi Valley at the present site of Portage, Wisconsin. By the "Meskousing" or Wisconsin River, "after proceeding 40 leagues on this same route we arrived at the mouth of our river; and at 42 and a half degrees of latitude we safely entered Mississippi on the 17th of June, with a joy which I cannot express.

De Fer's map of 1702. La Salle supposed that Matagordas Bay, where he landed, was on a branch of the Mississippi. His error was accepted as truth by the great map makers, Franquelin and Coronelli.

"Here we are, then on this so renowned river, all of whose peculiar features I have endeavored to note carefully. . ." So runs the narrative by Father Marquette. "We descend, following the current of the river called Pekitanoui. . . (the Missouri) a river of considerable size, coming from the northwest, from a great distance. . . I hope by its means to discover the Vermillion or California sea. . . After a month's navigation while descending Mississippi from the 42nd to the 34th degree, and beyond, and after preaching, we start from the village of the Akensea to retrace our steps." This village is supposed to have been above the Arkansas in the neighborhood of the place where De Soto died in 1541. The whole length of the Mississippi had now been traversed by white men and Joliet and Marquette had no hesitation in placing the whole river correctly upon the map.

The first to appreciate the tremendous possibilities of the Mississippi Valley was Robert Cavelier, Sieur de La Salle. From 1666, when La Salle arrived in Canada, until his death, La Salle's life was devoted to exploration and colonization projects in the Mississippi Valley. In 1682, La Salle made the complete passage to the mouth of the river where, on April 9, 1682, possession was taken of the valley in the name of Louis the Great, King of France and of Navarre. In honor of the king the region was named Louisiana. In 1684 a French expedition under La Salle, with colonists, attempted the occupation of the valley from the Gulf of Mexico. Misfortune attended his effort and landed him with a remnant of his forces in Texas far beyond the mouth of the river. Misfortunes that had dogged his steps from his earliest ventures in Canada were ended by the bullet of an assassin, one of his company, on March 19, 1687, in Texas.

The French colonization schemes of La Salle were given support for many years by his faithful lieutenant Henri de Tonti, established at the Fort of St. Louis on the Illinois. The founder of Louisiana was a Canadian backwoodsman, Pierre Le Moyne Iberville, who, in 1699, established a fort at the present site of Biloxi. This expedition gave definitely the correct position of the mouth of (Concluded on page 26)

My Meeting With Charles J. Finger

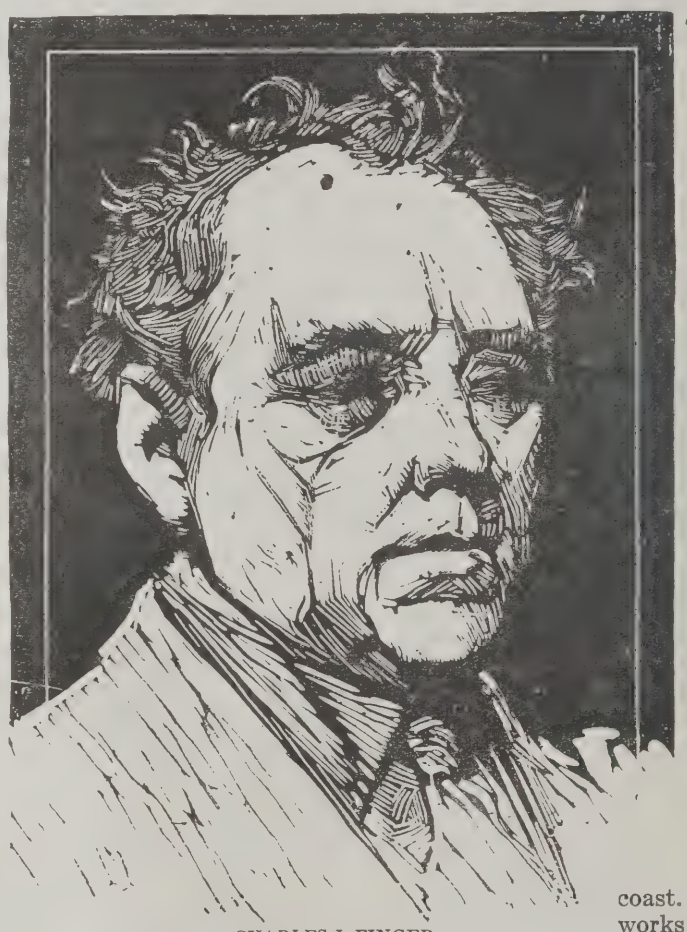
Squire of the Ozarks at Home—Some Intimate Glimpses

By C. A. NEWMAN

IT WAS early one morning when I first met the Squire of the Ozarks, as Carl Van Doren dubbed Charles J. Finger. He and two of his children were riding, and when I hailed him from my taxi, he wheeled and motioned the children to ride on. Our talk was staccato and hurried. He had an engagement. He did not care for publicity. But I could make myself known at the house if I chose, and would be taken care of. Then he was off again, clattering down the lane with measured gallop and swinging light with the motion as if he and horse were one. So I had my impressionistic glance. There was no eccentricity of dress, no particular oddness of manner except a certain brusqueness. He had the bronzed face of a man of the open, with clear, healthy skin; iron-gray hair; eyes steady and firm; broad shoulders; arms bare to the elbow; red silk handkerchief loosely knotted about his throat; brown strong hands; a habit of running his fingers through his hair; a quick flashing smile; no artificial barriers. He was evidently a man who would be at home anywhere, in a fo'c'sl as in a drawing room.

The house was plain to severity, a large wooden structure built by Finger and his boys at the foot of Mount Kessler. When the family left the city it took care to carry with it the best that civilization offers. There were books by the thousand; there were musical instruments and music; there were framed pictures, pencil sketches, charcoal drawings, etchings, things by Bloch, by Honoré, Brangwyn, Somerfield, Triedler, Chamberlain. There were autographed photographs of W. H. Hudson, Cunninghame Graham, Ade, Sterling, David Guion, Sandburg, and many more. There were rare editions and author's gift copies, illuminated parchments and steel engravings, ship models, and arms of many kinds. And the arms his children use, boys and girls alike, are revolvers, rifles, bows and arrows. Those children, let me say, are pictures of health, ruddy-skinned, straight-limbed, active, healthy.

When the Squire of the Ozarks appeared, two hours later, he burst out with an emphatic question. Was I hungry? Was I good for a five-mile walk? If not and if so, we had better walk. Over the mountains was a sight to see. He would show me the home of the last of the black wolves. He would show me a sight that would make me glad and grateful to be there. Anyway, one could talk better in the open. So we left the house and the way we went was rough and rocky. We crossed a valley, we climbed hill after hill, we paused awhile at a precipitous place where a world of wild beauty lay outspread, we drank deeply of a mountain spring, we surveyed a wide black waste where he and his family had recently worked all night to kill a forest fire, and at last we came to a place of many trees where we halted. From a bag my host produced bread and cheese and I needed no invitation to eat.



CHARLES J. FINGER—
Woodblock by Paul Honore.

As a planned thing the interview went all wrong. My prepared questions were never asked. In parenthesis I got a notion of his past life, of his youth spent in out-of-the-way places; of an early manhood spent in vast activities and in places of responsibility, and then we hit upon literature. I was amazed at his knowledge. He seemed to have read everything and to have stored up everything in a retentive mind. He was most emphatic about the necessity for a knowledge of literature as the stored-up experience of the race. Because of that I drew a wrong conclusion and said something about the activity of the printing press being a sign of progress.

"There is nothing in the reading habit, as such," said Mr. Finger. "The reading of books may be a foolish waste of time, and the mere acquisition of facts may be nothing more than the making of a kind of lumber room of the mind. A painstaking workman may easily be a more valuable citizen than a bookworm. The thing that counts is the training of the mind to observe, to compare, to generalize safely. The object to be aimed at in education is the achievement of a sound discipline in the use of the mind to the end that there may be sterling character and decent manners and that evidence of high breeding you see in a thoroughbred horse."

That led to much discussion. Presently we were talking of the Niagara of books pouring from the publishers and wondering how much was essentially ephemeral, how much of permanent value. My host told me of a chart of literature he had made, which he commenced when he was a lighthouse keeper long ago, off some Brazilian coast. His notion was that those works of fiction whose value was well established in the judgments of the thoughtful, were, broadly speaking, not based on plot, but upon character portrayal. The writer who conceived and depicted a character compounded of subtle and profound elements, who showed that character shaken in a storm of emotion, who grouped about that main character subordinate characters, and who found the action growing out of the collisions of the characters—that writer stood a chance to live in his works. Because of that, Finger chose Conrad and Barrie and Crane and Henry James as four whose works would live.

We touched upon a recent article in the *Current Opinion*, in which it was written that Finger represented a reaction against the sex-obsession in books.

"As to my books 'Highwaymen and Bushrangers,' and the 'Romantic Rascals,' which now appears in THE DEARBORN INDEPENDENT, I wrote all the stories for my own amusement and for the amusement of my older children and their friends. Those young people come out here to play tennis, to ride, to enjoy themselves and their world is the world of any healthy, clean-minded, imaginative youth. When I was at that age, my reading was all of fellows who fought against tremendous forces, of men thwarted but still fighting, men resolved to struggle on in feebleness rather than to collapse in despair. I was full of Jules Verne, and Captain Mayne Read, and James Fenimore Cooper, and Defoe, and Mark Twain, and Rider Haggard, and Conan Doyle, and the Peter Parley series. We resented the intrusion when an author introduced a woman character. She was a hindrance to real adventure. Generally speaking, the young people who come here are only mildly interested in lovers looking into one another's eyes. And to my thinking, there is about as much sense in building a book around the effort of a man to win a woman as there would be in writing a book about the effort of a hungry hobo to get a square meal. But tales of fierce activity with life as a vast and urgent business, there's another matter altogether."

Literature of the Present Day

"What of the public demand for the sex stuff?" I asked.

"How do you know that there is a demand for it? Shrewd and persistent advertising will do anything and the average publisher will bend his efforts to push any book that seems likely to enjoy a success of scandal though a dozen works of superior merit die from inattention. Books are sold just as soap or imitation diamonds are sold, by loud clamor. The public does not worship at the shrine of the goddess of lubricity any more than it worships at the shrine of Karl Marx. Yet Bellamy's 'Looking Backwards' sold tremendously. As for the prevalence of those books which give particular prominence to one form of passion, that may be partly due to the fact that so many of the writing men live in cities and so lead cramped and restricted lives. Their entire environment is artificial and they live artificially. There is a cult of artificiality. Some of them play the part of the self-conscious prig. So the world thus portrayed is not normal. It is as abnormal as the world of pastoral poetry where shepherds and beribboned shepherdesses sang and conversed in rhymed iambics. It was the fashion to picture a world of rural innocence and perfection. Now and in the cities, it is the fashion to picture a world of venery and carnality."

"Do you think that there is degradation in the portrayal of grossness?"

"Yes, with neurotics perhaps. Grossness exists in life, but only the careless and unobservant see nothing but grossness. In my 'Lawless Lands' I have not been prudish. I have not ignored the coarser accidents of life by any means. The atrocious fault of taste comes in in a deliberate narrowing down of the scope of things to a place where the sex-obsession fills the horizon."

"Why not a censorship against that kind of thing?"

"That is to shift responsibility as I see it. I'm all for self-reliance and independence, in discipline of self more than in discipline by definite rules. The whole nation is too ready to depute everything to someone else or to some organized body. That accounts for the tremendous cost of government. Put it this way. My children are free to eat corn dodger and salt pork if they choose, or they might make themselves uncomfortable on a surfeit of cream puffs and Gorgonzola cheese. Instead, they know that safety lies in good honest beef and baked potatoes. That knowledge has come to them through training. There are books that I consider mischievous. A positive word then becomes necessary. To give an instance, if you ask it, I would say Mordell's Erotic Motive in Literature. It is silly in its suggestiveness. It is superficial and it is shallow.

"Because of a kind of unrestricted comradeship with my children, we were able to discuss it just as man would with man. We easily came to see that the author's conclusions were ridiculously erroneous. Suppose I had tried to put the book under a ban. Is it not plain that there would have been a natural curiosity to see *why* it had been placed on the index? In short, I would rather attend to matters of environment myself, than pay the bill for others to do it. My dream is of my children grown, able to take care of themselves, good sportsmen, incapable of dishonesty, using the word in its largest sense, plain, blunt, clear thinking, above all considering themselves responsible agents and not human machines."

"You seem to have done a tremendous amount of literary work in four years. Four books—"

"Five, including 'Silver, Lands' a book of folk tales."

"How many brochures for the Kansas people?"

"Thirty-four, I think."

"And Edward O'Brien has listed you for four consecutive years as among the best of short-story writers. Has all this been done since you were here in the Ozarks? Had you not written some before? How do you work?"

Finger Not a Quick Worker

"I work as I did when I was an executive. I'm in my office at eight and write for six hours daily. All that I have done has been done since I was in this place, except some of the stories which were published in the book 'Lawless Lands.' They were sold to Mencken, to Reedy, to the *Youth's Companion* and to the *American Boy*.

"I am not a quick worker by any means. I write and rewrite, am never satisfied with what I have done, and have never done anything of which I am proud. But I hope to, some day. As for Edward O'Brien, no man was more astonished than I when I learned that he had reprinted one of my stories."

"All your work has been in the nature of short stories though rather long ones. Do you contemplate the making of a book, a novel?"

"I would like to, and it would be a business man's novel, in part autobiographical. As for immediate work, I am now at work on a book of little-known adventurers. As relief from that, I am gathering up old seamen songs, cowboy ballads, and so on, half-forgotten things—words and music, the latter harmonized by my friend Dr. Tovey, a musician of skill and ability. David Guion too is doing some of the harmonization. It would be a pity to let those old things die, and I'm one of the last of the Mohicans, so to speak."

"What about *All's Well*, your paper?"

"Its friends seem determined to keep its excellence a dark secret from their friends, so the circulation does not leap and bound. . . But let us go to the house."

"One more question, please. By what writers have you been influenced?"

After Supper by the Wood Fire

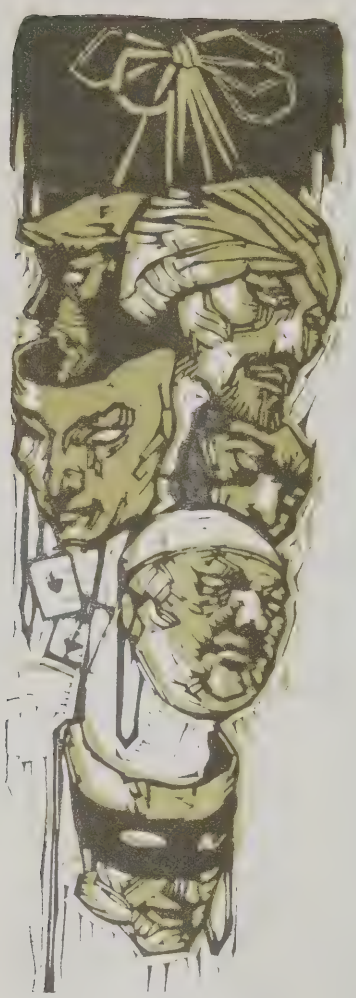
The answer came without the least hesitation, "W. H. Hudson, Conrad, Cunninghame Graham—and Edward O'Brien guessed right."

After supper we sat in the big room, lighted by the flames of a wood fire, for in that altitude it is chilly in March of an evening, though the day is warm. I think it was one of the most pleasant evenings I ever spent.

There was perfect camaraderie chat, laughter and some rather warm argument about a game of basketball. Then Dr. Tovey dropped in and sat down to the piano, but his mood was merry and not classical.

So music led to singing and from singing they passed to dramatics, and when the lamps were lighted there was the performance of part of Dunsany's "Night at an Inn" with the Squire of the Ozarks taking the part of Klesh with great animation, though, because of his girth, he became the butt of the others. It was all very sociable and pleasant indeed.

The trouble is that the life spacious cannot be led when one lives in an apartment, and everyone cannot build a home in the mountains.



Romantic Rascals—No. 1

Edward Wortley Montague

By CHARLES J. FINGER
Author of "Highwaymen," "In Lawless Lands," "Bushrangers," "Tales From Silver Lands," etc.

Wood blocks cut by Paul Honoré.
(Copyright, 1925, by Charles J. Finger)

In this the first of a series of articles dealing with certain noted vagabonds of the past, Charles J. Finger writes entertainingly of Edward Wortley Montague, the scion of an English noble house.

ONE day in the year 1724, it chanced that Master Edward Wortley Montague, aged twelve years, was in a fractious mood, a circumstance the more annoying to his mother, the Lady Mary Montague, because she had arranged a party for that day, and her house, the noblest in Portman Square, London, was in gala array.

The boy had flashed into one of his rages on slight provocation and had wilfully smashed glass and china as sign of his displeasure. It was clear that another such outbreak when the guests were present would be fatal to the success of the function. So my lady was almost in tears, when Edward Wortley, her husband, had a brilliant idea, though when he gave it words, his face expressed misgiving.

"Send the boy out somewhere," he said, a little testily. "Send him out with a footman to where there is some interest and excitement."

"I never thought of that," said his wife, who was preoccupied with her party and her book on the Vindication of Shakespeare, and she lost no time in summoning a servant and in calling her son, and to the latter the subject of an outing was broached. Still, things hung in suspense for a time. In vain the attractions of a visit to the Fleet prison, to a Punch-and-Judy performance, and to Southwark where Cadman the tight-rope dancer played, came up for consideration. The boy's headshake became more emphatic and he declared that the conference was closed so far as he was concerned. He would not budge, he said. So he turned to leave, and his hand was on the door handle, when a remark held him.

"Now I come to think of it, my lady, there's to be a hanging today at Tyburn," said the footman. "Maybe the young master would enjoy that. It's to be Jack Sheppard who broke out of Newgate, my lady."

Then sire and son spoke at the same time, the one saying with warm approval, "An excellent idea, by gad! I'd like to see it myself if it were not for this party," and the other, "Yes. I'll go to that if you give me some money."

So the matter was happily decided, and, piloted by the tall footman, Edward Wortley Montague, in the midst of an ever-growing crowd, beheld the young thief fall to his death, and the literary party at Portman Square was a success.

Thus, too, the heir of Montague found a new delight and thereafter rarely missed the spectacle of a pilloried man, nor of a public whipping, nor of an execution, and was happy to the pitch of ecstacy when, six months later, he ran by the side of the hangman's cart, one of many who pelted the condemned thief-taker, Jonathan Wild, with stones, dead rats and cats, and gutter filth. After the hanging, and when Master Edward was enjoying the hounding of a small Jamaican Negro boy by some rapscallions from the river side, he found himself taken by the ear with no gentle pinch, and it was a tearful and an angry boy that was led to his home door by the direct and emphatic Daniel Defoe.

"School, my lady, school and discipline is what the boy needs," declared the journalist, looking with steady, gray eyes at the beautifully robed Lady Montague, and talking as he would have talked to king or to plowman. "To his yelps give no ear. Put him to school and keep a tight rein on him. Curb him. Hold him in, lest he run away like a bad horse."

"I am sure there's no harm in the lad. It is only his high spirits," said the mother, speaking in her sweetest tones, but Mr. Defoe was firm and would have no propitiations.

"Let it be Westminster school," he insisted. "It is a place where they keep a rod in pickle for young cubs."

Now the man at whose word Bolingbroke, and Rochester, and Harley lent attentive ear was not to be lightly disregarded, so Westminster school it was, and, for a time, the lad was checked in his selfish pleasure. Almost he came to have the ideals of the three hundred and odd lads about him, boys careless and graceful, who realized that some day they must face life as men strong, courageous and gallant. But there came a day when the redoubtable James Figg, self-styled champion of England, was to meet Ned Sutton in battle, and the news penetrated to the school. Then to the lad, unused to self-restraint, the orderly world about him became distasteful, and the other world of riot and disorder a something much to be desired. So he sallied out in the early morning by way of a back window, a lad of tyrannic will determined to oppose the prejudices of parents and teachers, and at Hounslow, where the men fought that afternoon, the Westminster scholar was shrilly vociferous, and also penniless, when, at the end of six brutal rounds, the redoubtable Sutton fell defeated.

It had been a day of foolish wastefulness and rough company, and he had given no thought to consequences, but when the excitement was over there came upon him a sadder spirit as he reflected that while he had danced to his own tune, the piper remained to be paid. To return to Westminster meant a sound thrashing for disobedience and the breaking of bounds, and to go to Portman Square meant a swift and early return to Westminster, so the sad conviction came upon him that his only safe course was to get away.

Two days later, the bellman was going about the town, informing one and all that the son of Lady Montague had mysteriously disappeared, and whoso delivered him to Portman Square might claim a reward of twenty pounds. But while the news thus became known to all London, it stopped sharply at the edge of town,

for between town and country, in those days, there was very little communication. Because of that, Master Edward was secure for a time, for, fearful of pursuit, he had made his way toward Kent. Then, at the hamlet of Birling, where two roads met, he came upon a dirty man carrying a black bundle, who said he was on his way to Maidstone. There was fraternizing then, and at an alehouse they took bread and cheese and beer together. While there was a smell of soot about his companion that at first annoyed Master Montague, it was overlooked when it transpired that the wanderer was a chimney sweep, and that in the profession he followed there was a life of freedom and of high emoluments. The upshot of it was that the heir of great estates sold his fine clothes, donned the garb of a chimney sweep's boy and in that capacity he served for a year and a half. Indeed, he might have served much longer had it not been that his employer, Mr. Atkins, chancing to be in the neighborhood of Wharncliffe Lodge in Yorkshire, which was the country home of the Montague family and the birthplace of Edward himself, came to hear the story of the disappearance of the heir, and the far more interesting news of the offered reward. After that, tangles were soon unraveled and mysteries solved, and the sweep duly delivered his helper to Portman Square.

But Montague was not born to live his life on peaceful and orderly lines. There was a return to Westminster school, but the acquisition of arid facts and the history of the Punic Wars paled sadly, when the lad compared them to other things. School seemed a very spiritless business indeed when two pirates were to suffer at Execution Dock. So, on August 11, when Gow and Williams were hanged, Master Montague was there to see, and, the affair ended, there was a consorting with sailor men, which lasted for several days. Then came financial stringency and a realization of the necessity for an avoidance of unpleasant scenes, so again he sought a life of dash and of go. There was a year of apprenticeship to a fisherman at Blackwall, then a voyage with a merchantman to Oporto, then a period of wandering in Holland as a day laborer, then seeing France, where he worked as a coachman, and next crossing the German states in company with a troupe of showmen with Montague intoxicated with public applause because of his agility as an acrobat. After that, being grown to man's estate, he went to Rome, where he dressed as an abbot and was accepted as such. But Rome did not please him and preferment in the church seemed slow, so he made his way to Hamburg and there became popular as a fashionable and eloquent Lutheran preacher.

Visitors at Portman Square found him sitting cross-legged on the floor reading the Koran.

All that, however, is only part of the tale. The record is not always clear, and how far he went, and into what countries he penetrated, cannot be said. There were times when he flourished, a dandy of the dandies, dressed in velvet starred with diamonds, or in pearl-embroidered silks; there were other times when he was the companion of butcher boys, of crossing sweepers, of drabs, of the scum of a city; there were times again when he was a gamester, a scandalous roisterer, a dare-devil. We have Walpole's word for it that he was "the greatest miracle of his age." Certainly he became an excellent linguist, learning the languages of the countries through which he passed, with apparent ease. And not only was he versed in the more familiar tongues, but he could converse in Persian, in Chaldaic, and in Hebrew.

His was an enthusiasm always at white heat, and he was ever eager to experience the hot frenzy of life. As in Rome he had been a Romanist and in Hamburg a Lutheran, so in Arabia he became converted to Mohammedanism, and on one of his trips to England, those who called at Portman Square found him sitting cross-legged on the floor, reading his Koran. For there were many flying trips made to England, during which he played many parts—sometimes that of the rural squire on the Yorkshire estate, sometimes that of an exquisite, sometimes that of the rascal. There is one story told, naturally difficult to verify, that soon after the execution of Dick Turpin the highwayman, in York, Edward Montague decided to try his hand at a dangerous game. So, on April 5, 1740, he stopped the Bristol coach, a lone wolf of an amateur highwayman on foot, with no other weapon than a broken-off walking cane which had the rough semblance of a pistol.

Then again we find him in fine society, in the company of Lord Chesterfield, making a bet that he would play a wonderful trick with the credulous, wonder-loving public. So on January 10, 1749, an advertisement appeared, announcing that on the next day at the Haymarket Theater, a skilled performer would "play on a walking cane the music of every instrument then used . . . and would get into a quart bottle and while there sing several songs . . . " And an unthinking public, always agog for fresh excitment, crowded the theater and was kept waiting for some hours without as much as a playing fiddle to cheer it. (Concluded on page 25)

Sapiro's Peach and Fig Growers

Association Admits It Has Lost Control of Producers

By ROBERT MORGAN

THE history of the coöperative marketing of farm products in the United States is one of the most interesting industrial and commercial records ever written. The history of those coöperative marketing associations organized upon the so-called "California Plan," in reality the Sapiro Plan, since 1915 when the influence of Jewish money and methods first began to make themselves felt, is the gloomiest tragedy written in American agriculture since Reconstruction days in the South. But, at the end of a decade of alien experimentation in exploiting the farmer at the farmer's expense, there seem to be a number of indications that the shadow of this domination is falling away from the sun of common sense.

More than half the Sapiro Plan coöperative marketing associations either have been reorganized on American business methods, or have failed. In each of the sections, and in each of the varieties of agricultural products, in which these Sapiro Plan associations have functioned, the producers are insisting on complete reorganization, as in the case of the California Prune and Apricot Growers; permanent elimination of the Jews and their agents, as in the Lompoc Valley bean-growers' disaster; control of the merchandising of their own crops, as in the case of the Colorado potato-growers; official investigation to fix responsibility for losses, as in the grain-growers of the Pacific Northwest; or complete change in organization and in distribution and sales methods, as with the rice men of North-Central California.

Officials of the California Peach and Fig Growers' Association admit, in a statement issued to the press on March 3, 1925, that they have been able this year to obtain only 25 per cent of the peach acreage and 28 per cent of the fig acreage as signatories to the contracts of the association. One of the required provisions for the continuous existence of this association is control of 80 per cent of the acreage of both crops. The association is founded on the Sapiro Plan, and has been pointed to as one of the "successes" under that plan, but it appears that the producers of peaches and figs throughout California have decided to pay no more tribute to an alien scheme of coöperative marketing.

A committee of thirty-eight growers who support the Sapiro Plan has been formed to whip the remaining growers of the state's peach and fig crops into line, and so serious is the situation that Ward B. Minturn, president of the association, has taken personal charge of the campaign.

When Farmers Are in Control

Through this decade of development of the coöperative marketing idea in the United States one fact presents itself more clearly than any other result: Whenever and wherever the coöperative marketing association has been established as a purely merchandising agency for the farmers' products, *under the control and direction of the farmers themselves,* and with competent American business men in charge of the distribution and marketing, that association has been at least moderately successful.

This is one of the few facts developed by an extensive survey of coöperative marketing plans of all kinds made by the writer in the past two years.

Opposed to this axiom of coöperative marketing appears a preponderance of evidence tending to show that *wherever and whenever a cooperative marketing association has been organized and directed by outside influences,* with the farmer barred from control over time of sale or price of his own product, *that association has met with disaster.*

Those associations which have been directed by men whose interests were not those of the farmer—and this has been true of a large majority of those established on the Sapiro Plan—have failed.

The United States Government, in its Department of Agriculture Bulletin No. 1302, issued late in 1924, shows that in the nine years, from 1915 to 1923, inclusive, *768 cooperative agricultural marketing associations went out of business.* Of these, 125 were in business at the beginning of 1915, when the Jewish attempt to exploit American agriculture began. This leaves 643 as having been organized in 1915-1923 and which failed.

Of the 768 which went out of business, 442, or 57.6 per cent reported their reason as "inefficient management." It remains to be said that other reasons given for the failures of large groups of these coöperatives were "dishonest management," "inadequate accounting systems," "capital stock falling into the hands of too few," "lack of proper auditing," and similar reasons, all of which have been exposed, in previous articles of this series, as factors of failure in associations established on the Sapiro Plan.

But associations not formed on the Sapiro Plan do not deliberately open their doors to let in these factors of failure. Farmers on the Pacific Coast, in the Pacific Northwest, the Middle West, the Northwest and the South—through which sections the writer traveled slowly during the past summer—have learned this fact: That by its very construction, the Sapiro Plan takes from them all control of their crop and its marketing, gives to dishonest men the *opportunity* to take the cash in one form or another, and leaves the producer to bear the burden of present and future debt.

Now, coöperative buying and selling associations in the United States grew from 5,424 organizations in 1915 to 10,160 in 1924. Of the number operating in 1924, there were 5,733 purchasing associations. Coöperative purchasing associations usually succeed, because, briefly stated, it is easier to buy cheaply in quantity than it is to sell in quantity at even the current market price. Those coöperative marketing associations which have overcome this obstacle to successful quantity selling have done so by widening their markets, *a method no Sapiro Plan association has yet adopted.*

A Secret Closely Guarded

Deducting the 5,733 buying associations from the 10,160 operating in the United States at the beginning of 1924, we have 4,427 remaining as coöperative marketing, that is to say, selling, associations.

The most closely guarded secret in the headquarters of Sapiro, Levy, Hatfield and Hayes, in San Francisco, is the number of associations using the Sapiro Plan, and, next to that the number which have been organized since 1915 by Aaron Sapiro himself. The writer has been trying for more than two years to get these figures; *apparently the Department of Agriculture does not have them,* at least they do not appear in the exhaustive 1924 report; and it is the belief of the writer that no one except Aaron

(Continued on page 22)

Identification of J. Wilkes Booth

Proofs That Man Shot in Garrett Barn Was Booth—Disposal of Body

By F. L. BLACK

ABOUT the time of the Lincoln Birthday celebration this year, the Booth Myth was reviewed in the public press. Among the numerous articles which appeared was one in the Minneapolis *Daily Star*. It was an interview with a Minneapolis woman who claimed to be the daughter of Junius Brutus Booth (known as "the younger"), a brother of Edwin and John Wilkes. This would make her a niece of Lincoln's assassin. Unfortunately for the interest of the story, reference to the listed histories of the Actor-Booth family fails to corroborate her claim of relationship.

In the newspaper stories sent broadcast by the International News Service, Miss Booth claimed that her uncle, John Wilkes Booth, called on her in St. Louis in the late eighties or early nineties and although she considered him at that time an imposter, he finally convinced her of his identity by recalling various events of their childhood.

The old penitentiary building located in the arsenal grounds where the conspirators were tried, executed and buried. It was also in this building that the body of John Wilkes Booth was first interred.

Then follows a recital of parts of Finis L. Bates' book and a statement by Miss Booth that the body of David George is indeed that of her uncle. THE DEARBORN INDEPENDENT has in its files an affidavit, dated March 29, 1922, given by Blanche Booth to Mr. Bates in which she states:

"During my residence in Minneapolis I joined the Sanford Dodge Company. During the tour the company acted in Enid, Oklahoma, where we know now that John Wilkes Booth had been living under the name of David E. George. We were playing one-night stands at Enid, Oklahoma, to the best of my recollection, during the month of December, 1902. I was in my room at a hotel in Enid, getting ready to take a needed rest, having to act that night, being dreadfully fatigued. A knock came upon my bedroom door; I went to the door and opened it; it was late in the afternoon, the shades were down, a man was there who said, 'Blanche, would you like to see Johnny,' in a quiet tone, and handed me a card; not realizing then the truth of what was transpiring, I said to this dark-complexioned man, 'I act tonight and must have my rest,' and closed the door. Before going to the theater that night I glanced at the card which I had thrown upon the table, on which was written 'John Wilkes Booth.' I did not realize then the truth of the chance I had of meeting face to face my uncle, John Wilkes Booth."

When interviewed for THE DEARBORN INDEPENDENT in March, 1925, Blanche Booth stated that two years before the assassination of Abraham Lincoln, John Wilkes Booth called for the last time at her home and that she was then seven or eight years of age. She stated that she did not know positively that John Wilkes Booth escaped, but that she had accepted the theories of Finis L. Bates, who she claimed had gone into the matter very thoroughly and had frequently consulted her in connection with the matter. When, however, the differences between her story as given to the press February 21, 1925, and the affidavit as given to Mr. Bates March 29, 1922, were pointed out, Miss Booth claimed that her 1925 story was correct.

The only pictures in her possession were a copy of Bates' tintype of St. Helen, a copy of a picture of David George taken after his death, which had been given her by Mr. Bates, and a copy of a very common picture of John Wilkes Booth taken before the assassination. She could produce no documentary or other proof to substantiate her statements.

Miss Booth's value as a contributor to the matter is somewhat depreciated by the fact that in each of the three statements she has contradicted herself on some point. In the story recently given the newspapers, she says that the only time she saw her uncle after the assassination was in St. Louis in the "late 80's or early 90's." In the affidavit given Mr. Bates the date is 1902, and the place is Enid. She states in the affidavit, "When I had grown into young womanhood I met again my uncle, John Wilkes Booth, who had come to play a theatrical star engagement in my Uncle Ben De Bar's theater, St. Louis . . . . I went on the stage the same year that John Wilkes Booth assassinated President Lincoln." This does not tally with her statement that she was seven or eight years of age two years before the assassination.

We now present a summary of all the facts disclosed by our investigation, which will probably be accepted as final by the majority of readers.

The Payment of the Reward

In recent newspaper accounts the statement has been made that the government was not satisfied that the man shot in the Garrett barn was Booth and consequently had never paid the reward.

This is not only untrue in fact, but is a fair sample of the unreliability of numerous statements dealing with the assassination, which THE DEARBORN INDEPENDENT has checked and found worthless.

The matter of reward for the capture of Booth was placed before a Committee on Claims of the House of Representatives, which, according to the *Congressional Globe* Part 5—1st. Session, 39th Congress, made their report on July 26, 1866. The appropriation was made by the act of July 28, 1866 (14 stat. 341). The amounts were considered by many to be unfairly distributed. The sums finally paid and the persons receiving them are as follows:

E. J. Conger, detective	$15,000
Lafayette C. Baker, detective	3,750
Luther B. Baker, detective	3,000
Lieutenant Edward P. Doherty, in command of the cavalry	5,250
James R. O'Beirne, detective	2,000
H. H. Wells, George Cottingham, Alexander Lovett, each $1,000	3,000

The Last Wilderness in Superior Forest

How Men Are Seeking to Save It Unspoiled as a Bit of the Old America

By EARL CHRISTMAS

OUR grandchildren in time to come will read with wonder of the moose, the elk and other magnificent creatures of the wild, of the great virgin forests once to be found over much of this country. The story of pioneer life will be scanned eagerly. But in a few decades, judging from the present tendencies of our modern civilization, all these things will live for the most part only in books.

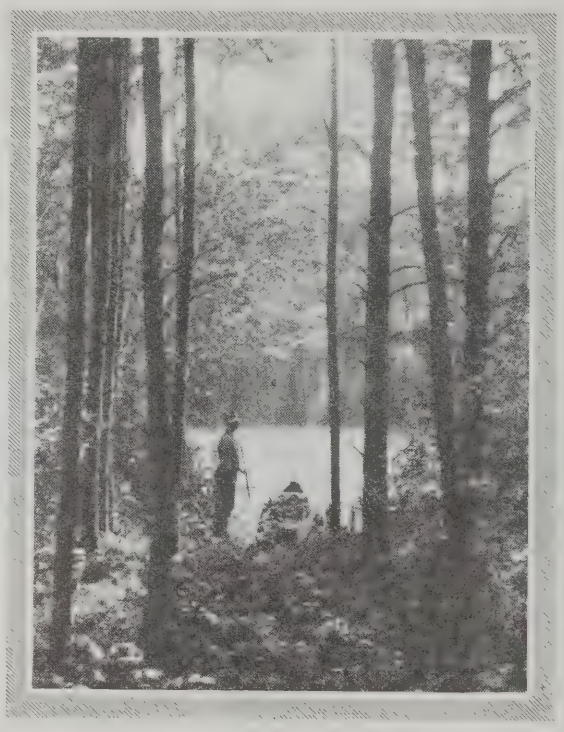
If, then, a few generations hence, we can have just a few spots with things as they were before the coming of the white man, think how much it will mean. Imagine in fifty or a hundred years, if the growth of settlement and the destruction of our timbered regions continue, what an oasis there will be in just one bit of unspoiled wilderness!

The time will come, and at no very distant day, when men will search in vain for such retreats. In fact, the eastern half of the United States virtually has been stripped bare of them now, and the same thing is true of much of the remainder. Cities and towns are growing up at a rapid rate, and settlements are pushing out into new territories. But faster still, the ax of the woodman, fire and man's indifference are destroying our forests, leaving wide areas of land an idle, unproductive waste. Our wild animals are faring no better. Man is the great destroyer.

We have come to the point now where friends of nature are talking of "the last wilderness." The statement has been made that the Superior National Forest and several million acres surrounding it in Northeastern Minnesota constitute the last real wilderness, where nature still may be found at its best. The statement comes so near being true literally that it is tragic.

Think of all the great forests that once covered this country. When the white man came to America, nearly half of what is now the United States was in forest. Of all this vast domain, but a pitiful remnant remains. The lumber industry, eating its way across the land, virtually has passed beyond the Rockies. Of every ten acres of primeval forest, eight acres are gone—gone the way of the buffalo and the antelope. I know not which is the greater tragedy, the loss of our trees or the wanton destruction of our animals. Of the millions of buffaloes that fed on the plains, only a small number are left on ranches or in parks. The antelope virtually is gone, and so are many other animals that once were plentiful.

But there is one place where the wilderness still is preserved. Virgin forests stand in the Superior Forest region, up between the International Boundary and the north shore of Lake Superior, and the native animals, gathered there as a kind of last refuge, are to be found much as in the days before the coming of the white man. Dietrich Lang, author and naturalist, tells me that except for the panther and possibly the glutton, all the wild creatures which have lived in this part of the country within historic time still are to be found in the region.



Where in another generation or two can one find such a wilderness? Nature lovers want to preserve it just as it is.

There the moose is making one of his last stands. The moose, fine, majestic creature that he is, has been all but exterminated over much of his old range. As the settlement of the country progressed, he has been driven farther and farther into his diminishing retreats in the wilds, and the hunters have pursued him with disastrous result. The deer gets along very well in a region where there are scattered settlements, but the moose wants to get as far away from man as possible.

In the depths of the Superior Forest and the game preserve surrounding it, the moose has found the only undisturbed breeding place in this section, and the herd gathered there is one of the few left in the United States. Though estimates vary greatly, there are said to be about 3,000 moose in this region, constituting probably the most important herd left in this country, certainly the only large group in the central part of the country.

The beaver, once near extinction in Minnesota as in most other parts of the country, is numerous in the Superior Forest region. Bears also are common, too common, according to timorous campers, who sometimes complain of their attempts to be sociable. Large numbers of deer are to be found in the region. Even caribou have been seen on occasion. The chipmunk, the bobcat, the lynx, the timber wolf, squirrels galore, the marten—all are there. The lakes abound with fish, black bass, lake trout, northern pike and pickerel.

But so far as man is concerned, the region is wild and practically uninhabited. It is spotted with countless lakes, and many of them are laced together with connecting arms or streams, which make good waterways for the canoe. In fact, the canoe is the only means of travel for a hundred miles or so through the expanse of the forest.

Passing from one lake to another by means of one of these channels, one can travel for days and weeks and never see a sign of the habitation of man. Much of the territory around the forest is of the same character. Only rarely does the traveler come upon the abode of a white man in this region, and then it usually is the log cabin of a trapper hidden away in the woods somewhere. Camps of the Indians still are to be seen in the vicinity of the forest, particularly over in the Lake Vermilion district, where there is a small reservation.

The Superior Forest proper contains 857,000 acres of government land, and there are 150,000 acres of water, exclusive of rivers, though the proportion of water, as you go from lake to lake, really seems much greater. But the seemingly endless chains of lakes do not stop at the forest boundary.

With its rare combination of lakes and woods, this Superior Forest region is said to be the finest canoe country in the world, and I can readily believe it. Except for the region just across the boundary in Canada, which is of much the same nature, no nation has such a wilderness paradise for the canoe traveler. Imagine what England, with its teeming popula-

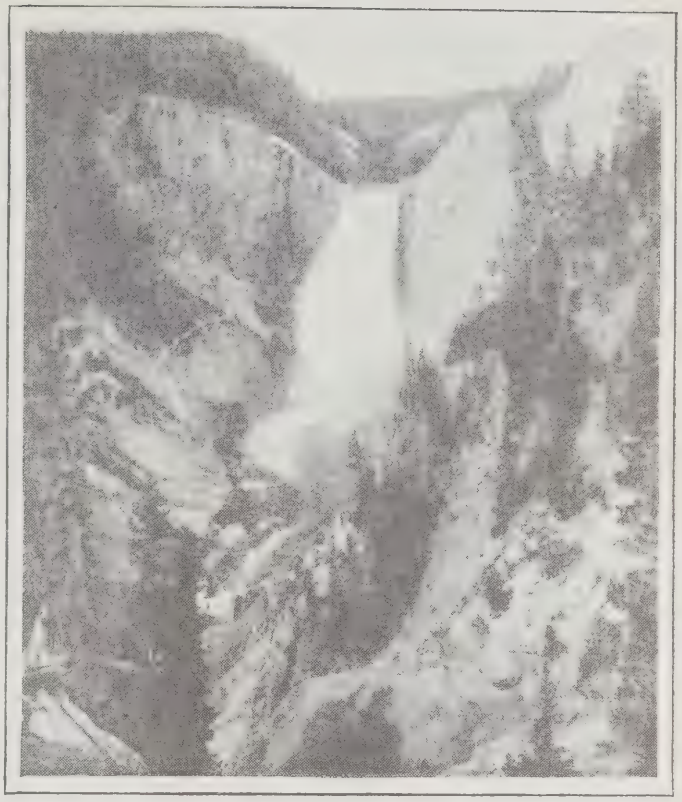
The Legend of Yellowstone Canyon



MANY years ago, when the Tetons were young—the lordly Tetons that thrust their snow-clad peaks, like giant, jagged saw-teeth, into the ever-changing blue of the sky—a mighty herd of bison roamed the plains and mountain slopes of that land of lakes and streams and forests that is now the State of Wyoming. Elk, antelope and moose, bear, deer and mountain sheep made their homes in the peaceful valleys or amid the romantic majesty of the granite walls. And in this sanctuary wilderness there lived a mighty Indian people, the Nez Perce, direct descendants of Kalowalo, God of the Sun.

Shinumo, the greatest chieftain, the strongest hunter, and the bravest warrior, ruled his tribe with unerring wisdom, led them to the best hunting grounds, gave just counsel in their differences, and watched them increase and prosper. And Shinumo, in turn, was ruled and counseled by the happiness in his heart; for had he not, but two moons ago, brought Lan-a-lol, the Little Moon Flower, to live with him, the Little Moon Flower whose unrivaled beauty was a source of never-ending joy? The softly sighing swish of the pine branches swaying in the breeze was music to the ears of Shinumo until there came a time, in the Season of the Rains, when the wind of Darkness blew down from the mountain tops and scattered before it the smile of Lan-a-lol.

Day after day the sun came up, making the peaks shift and glow, crags take fire, walls darken, and gray-green mesas, dimly seen, take on the gleam of opalescent lakes, but all was darkness in the sight of Shinumo. No longer would he lead the hunt for buffalo or mountain sheep, the care of his people was gone from his mind, and he thought only of the absent Little Moon Flower. The mighty Nez Perce, deprived of their leader, were drifting slowly toward dissolution when there came, one day, Ta-vwoats, the God of Life. Ta-vwoats sought out Shinumo and questioned him on the matter of his changed attitude and, upon learning the cause of his grief, offered to prove to him that the Little Moon Flower was in a happier land and that Shinumo mourned uselessly. Ta-vwoats would take the mighty chieftain over the road to heaven and let him look upon her there in her happiness.

That evening they started. In the west the day was dying in a pageantry of color. Above the range lay a fleet of flame-winged clouds, like treasure argosies borne on the crystal waves of a sea deeply, infinitely blue. The hush of early evening rested like a brooding veil above the stone-gray walls of the mountains.

Ta-vwoats and Shinumo walked on, while above them the scarlet glory began to fade into a fainter saffron. Soon, in the west, the clouds had faded to a somber gray. There remained but a delicate line of purest white, where all color had fled, against which the trees stood in phantom tracery. All night they went on and when morning came Ta-vwoats made a trail to lead the chief to the happy land.

A great, twisting gash was cut through the protecting mountains and its sides were painted in heterogeneous array with every color of the universe—with living, rejoicing colors that seemed to chant in chorus. As Shinumo watched the work of Ta-vwoats he saw the whole vista transformed as if the life and light of centuries of sunshine stored up in the rocks were now being poured forth as from one glorious fountain, flooding both earth and sky. When the road was made complete they traveled on and came at last to a spot from which Shinumo might look in upon his Little Moon Flower. He saw that the words of Ta-vwoats were true, that she was in a happier land and did not care to return to the slopes and valleys of the Tetons. Shinumo was at last content and willingly he followed Ta-vwoats on the return journey. When they had again passed through the gorgeous gateway, Ta-vwoats, lest the unworthy should find this happy land, rolled through the trail a wild surging river of roaring gray that foamed in the crooked, rugged gorges only to sweep out free and unencumbered farther on where the waters make miniature lakes that merged, shining, sparkling, calm as stars.

Today the tourist visits Wyoming's wonderland—the Yellowstone National Park. He sees the giant geyser basins, affording a sensation never to be forgotten, the scenic wilderness and its incomparable wealth of wild-animal life, Dunraven Pass, Tower Falls, Yellowstone Lake, Sylvan Pass, and at last he comes to stand upon the brink of the Grand Canyon of the Yellowstone River—to stand awed by the fresh marks of the Creator's mighty chisel. From Artist's Point he looks a thousand feet almost vertically down upon the foaming Yellowstone River, and southward three miles to the Great Falls where an onrushing mass of white and purple leaps out into magnificent silver plumes, dashes and foams in wheel-like whirls, displays glorious enthusiasm as it tosses from side to side, rolling, glinting, and singing in exuberance of mountain energy. The hushed observer sees spread before him the most glorious kaleidoscope of color he will ever see in nature. The steep slopes are inconceivably carved. Sometimes they lie in straight lines at easy angles, from which jut high, rocky prominences. Sometimes they seem carved from the side walls. Here and there jagged, rocky needles rise perpendicularly like groups of Gothic spires. The whole is colored more brokenly and vividly than the field of human imagination can conceive.

The canyon, with its foaming falls dissolving into mists, its calm forests hiding the singing river, its enormous granites peaked and domed against the sky, its inspiring silence haunted by distant water, suggests a dream.

The tourist goes on. Perhaps he visits the petrified forest, or stops to see the carved and fretted terraces at the Mammoth Hot Springs, but always he carries the memory of the canyon. To him it was a wonderful sight, a beautiful manifestation of the powers of erosion; but to some it is far more than that: it is the gateway—the road to heaven—made so many years ago by Ta-vwoats and traveled by Shinumo in his search for the Little Moon Flower and happiness.

Sapiro's Peach and Fig Growers

(*Continued from page 18*)

Sapiro and his brother Milton knows them. Gathered from all sources, however, there are reasons for saying that the number of coöperative marketing associations formed on the Sapiro Plan in the United States does not exceed 350, and that not more than half of these were directly organized by Aaron Sapiro, or his agents.

Big Decrease in Number of New Groups

These figures are not given as facts, but it is the writer's belief that they are subject to less than 10 per cent of error, either way.

The peak in coöperative marketing association formation in the United States came in 1919, when 618 organizations were set up. In this connection it is interesting to note that the government reports the first coöperative marketing association to have been an organization for the sale of cheese, founded in 1863, the only one in that year. The second association, also a cheese-vending organization, was formed in 1870, and it, likewise, was the only one established in that year. To return to comparative figures, however: In 1920, new associations to the number of 585 appeared; in 1921, there were 423; in 1922, the number fell to 253, and 1923 saw only 77 organized.

The banner year of the Sapiro Plan organizations is stated by their proponents to have been 1922, when it was claimed that an average of five and one-half associations a month were formed on this plan. This would give a rough total of 66 Sapiro Plan associations organized in 1922, out of the 253 which the Department of Agriculture says were attempted in that year. From the same source, I learn that 132 coöperative marketing associations ceased to operate in 1922. This is exactly twice the number of Sapiro Plan associations formed in that year, and more than half as many as the total of associations organized within that twelve-month period.

These figures show the beginning of a feeling on the part of farmers in 1922 that all was not well with the coöperative associations. But when we read that, in 1923, only seventy-seven associations were formed, as compared with seventy-two which ceased to operate, the attitude of the producers becomes a certainty. As a matter of fact, if figures carefully collected by the writer on his recent trip through the agricultural regions of this country are to be accepted as accurate, only 18 associations were formed on the Sapiro Plan in the United States in 1923, and only seven in 1924. These figures include both those associations in whose organizations either Aaron or Milton Sapiro took part, and those which were organized on the Sapiro Plan but without the actual presence of either of the celebrated brothers. The writer believes that these figures are accurate; but it has been impossible to obtain either confirmation or denial of them from the headquarters of the Sapiro Plan organization in San Francisco.

This drop from sixty-six Sapiro Plan associations, formed in 1922, to seven in 1924, is a fall of practically 90 per cent, a decrease of 59 associations in two years. This it should be remembered is not a decrease in the number of established Sapiro Plan associations, but a decrease in the number being organized, a definite and impressive falling off in the number of *new* Sapiro Plan groups being formed. Now, there are two reasons which can be offered for this decrease: First, that all the agricultural industries and crops are so well organized that the field is narrowed tremendously; and, second, that the agriculturists themselves are refusing to accept the promises of the organizers of the Sapiro Plan. The first reason is obviously incorrect, as attested by the fact that Aaron Sapiro himself only recently completed the organization of a group of New England fishermen on the Sapiro Plan, and by the further fact that, in April, 1924, only 2,025,000 of the farmers in the United States had been organized into coöperative associations of all kinds. Furthermore, agents of the Sapiro Plan have been unusually busy, throughout 1924, in the livestock industry, and among vegetable and grain producers in all sections of this country, as well as in Canada, with the result shown by the formation of the seven new Sapiro Plan groups.

In connection with this situation of a decreasing number of new coöperative associations,

Where the Plan Had Its Inception

the department of agriculture bulletin above mentioned makes the following interesting comment:

"Changes in the number of associations in the various geographic divisions between 1915 and 1924 have not been great, but changes in the distribution among the different divisions of the amount of business transacted are marked. The West-North Central, Pacific, and Mountain states have lost in relative importance, and the Middle Atlantic, South Central, South Atlantic, and New England states have gained."

Now the Sapiro Plan had its inception in the Pacific state of California, proceeding thence to the Pacific Northwest, thence to the West North Central states, such as Minnesota, Wisconsin and the Dakotas, and thereafter went into Colorado and the other Mountain states, only recently pressing eastward. At least 75 per cent of the coöperative agricultural marketing associations of California were based on the Sapiro Plan. Only one of them, according to the best information obtainable, has escaped destruction, or reorganization, or is not now in an internal dissension which vitally impairs whatever small amount of usefulness it may have had. About 70 per cent of the coöperatives in the Pacific Northwest were based on the Sapiro Plan, several of them having been inaugurated by Aaron Sapiro. With two exceptions, these are in the same conditions above reported for the California associations.

The Story of the Raisin-Growers

In other words, the Pacific and Pacific Northwestern states were the places of origin and greatest development of the Sapiro Plan. Yet the Department of Agriculture reports that these sections have "lost in relative importance" in the coöperative marketing movement.

The fight to save what could be saved from the wreckage of the Sapiro Plan associations has been long and bitter, and is by no means won, though many producers in these associations have lost everything they had.

The poultrymen are now in the midst of a battle to obtain control of their own product and its marketing.

The prune and apricot growers, who have been dealt with at length in these papers, have been reorganized again, the manager who was employed succeeding the Sapiro régime has been allowed to depart, and the Sapiro element is again in control.

The story of the bean-growers of one section has been told; their brothers in another section have prepared to risk what they have left of their crops and farms to rescue themselves from this Sapiro Plan association.

The raisin-growers, organized on the system from which Aaron Sapiro took many of the details of his plan, reorganized themselves on a diametrically different basis, with a competent American business man at their head. They have been successful because their rebuilt association is a huge, well-operated sales agency. Early in 1925, however, night riders appeared, raiding and burning the vineyards of those who would not sign the contracts of the association. The management of the organization has issued a disclaimer of any part in these outrages, and it is openly declared that alien influences are behind the night riders.

The Department of Agriculture report, discussing the decade between 1915 and 1924, continues:

"While there has been a marked increase in the total number of associations, the estimated membership and the estimated amount of business, the gains for some kinds of associations have been much greater than for others, so that the relative importance of the different kinds of associations has changed materially during the ten-year period, 1915-1924. As regards the number of organizations, livestock shipping associations have increased in relative importance, while associations handling dairy products and fruits and vegetables are a smaller fraction of the total number than formerly."

Producers Do Not Control Their Product

Outside the tobacco associations, whose disastrous history has been told in these columns, the Sapiro Plan has found the majority of its adherents in the dairying and fruit-and-vegetable producing districts. These are those which the government agents have found to be "a smaller fraction of the total number than formerly." Suspensions, failures, "reorganizations" and conflicts for control within these associations have been responsible for their reduction in numbers, while the livestock associations, in which the Sapiro Plan has been able to make little or no headway, "have increased in relative importance."

Supplementing this government report, which coincides to a marked degree with the results of the writer's investigations into the progress of coöperative marketing associations in general, it should be said that the investigation conducted at the same time into the progress of the Sapiro Plan associations in particular showed four interesting conditions:

First, that the percentage of loss to the farmer member is uniformly larger in the Sapiro Plan associations than it is even in badly managed associations formed on other plans.

Second, that the percentage of failure in Sapiro Plan associations through ignorant, incompetent, or dishonest management is greater than it is among associations established on other plans.

Third, that not one single Sapiro Plan association has been found, in which the membership is in actual, practical, working control and direction of the time of sale or the price of the crop or any part of it. Theoretically, this plan gives the producer control of his product; in actual working out, it puts the control either in the hands of a manager, or of a board of directors, the former of whom, or a majority of the latter, is or are directly responsible to the proponents of the Sapiro Plan.

Fourth, that there is not one single Sapiro Plan association in which from 25 to 50 per cent of the members are not dissatisfied with conditions, methods of operation, prices received, and results in general. The average of dissatisfaction in coöperatives in general in the United States is less than 7 per cent of the membership. This indicates that the average of dissatisfaction in the non-Sapiro Plan associations is one-fifth, or less, of that in the Sapiro Plan associations.

Fifth, that producers who operate outside the Sapiro Plan associations, but in the same districts with them, are receiving uniformly better prices for their crops, are being paid more promptly, and are getting better distribution for their products than are the members of these associations.

These conditions, apparent in every district in which a Sapiro Plan coöperative agricultural marketing association has been formed, have been exposed in this series of articles, and, here and there, by the rare newspapers which are not intimidated by the Jewish influence. These exposures of a widespread attempt to exploit the American farmer have caused the American farmer to pause in what heretofore has been a mad rush to accept the advertised panacea for all agricultural ailments—coöperation on the Sapiro Plan. The result is that it is becoming harder and harder for suave gentlemen to herd the grain and hay growers of the Pacific Northwest into line, to get signatures to the Sapiro Plan contracts.

It is true that there are hundreds of coöperative agricultural marketing associations in this country which are to a certain degree successful. Some of them have been operating satisfactorily to their members over so long a period that it would seem safe to say they are permanently successful. But not one of the successful coöperatives is erected or operated on the Sapiro Plan. The outstanding successes in this field are the associations of the citrus fruit-growers, the raisin-producers and the rice-growers, all of California, and the livestock associations of the Middle West. The foundation of each of these is the principle of making the association the sales agency for the producer, with competent management, always under control of the producer-member. This is as far from the Sapiro Plan as coöperation possibly could be carried. As a matter of fact, there is very little that is coöperative for the farmer about the Sapiro Plan associations, except the name; *but there is a vast amount of co-operation between the Jewish gentlemen who take and hold control of these associations, and furnish the loans and work the markets.*

There Are Six Causes for Failure

There are, in the opinion of the writer, six causes for failure of the associations founded on the Sapiro Plan, *not all of which ever have operated in any one association,* but some one or more of which is at work in every association of this kind which I have studied:

First, the economic unsoundness of the plan itself, which seeks to force supply down the throat of demand. The obvious and correct way to compel demand to absorb supply is to widen the market. The orange-growers, the rice-producers and the raisin men have done this, but not one single Sapiro Plan association of which the writer has yet heard has done it.

Second, "orderly marketing," a continuation of the effort to make demand meet supply. As a matter of fact this "orderly marketing" has never yet saved the members of any Sapiro Plan association from the results of overproduction, except at a high sacrifice in cold cash to the producer members.

Third, elimination in practice, no matter what may be claimed in theory, of the producer-member of the association from control or direction of the disposal or sale price of his crop. It should be added that invariably this control and direction is placed in the hands of those who are beholden to Jewish influences for their positions.

Fourth, extremely high costs of operation, ranging in some instances as high as 18 per cent of the gross value of the crop. The only organization in the world which gets less return for money paid to its employes than the Federal Government is a Sapiro Plan coöperative agricultural marketing association.

Fifth, incompetence, laziness and dishonesty of management. These are factors of failure which occur in frequency about in the order named. Probably all three are due largely to alien and non-agricultural influences in the appointment of the managements. Lack of interest in the welfare of the membership on the part of the management has been no small factor in the failure of several Sapiro Plan associations.

Sixth, the subservience of all local associations to the central state or sectional association, which, in turn, is to be made subservient to a national association, which, as Mr. Sapiro admitted in a published interview in the case of

(Concluded on page 31)

An Afternoon With an Optimist

(*Concluded from page 2*)

I felt now and then as if his eyes were asking questions that he hesitated to put into speech . . . An expressive voice; well-chosen words, coming along without any apparent hesitation or deliberate selection. Chiefly my impression was of a man who thought for himself, who has no use for platitudes, who wants truth not appearances, substances not shadows.

A jolly little terrier, with bright, kindly eyes, appeared at the window and said he would like to come in. He was promptly admitted; greeted me amiably, sat down by his master's toes and pretended a polite interest in our conversation.

"Yes, I like cats," said G.K.C., "but I don't know much about them or understand them."

Their un-understandability, I suggested, was part of their charm?

Impressions of Some Great Nations

"That's so, perhaps. There's something a bit mysterious about them and their ways. I've often watched a cat and dog; the cat seems to fascinate and paralyze the dog for a time; looks at him steadily and keeps him quiet, spellbound. Then the cat gives it up; there's a scurry and rush, and there'd be a fight if puss didn't take to flight. Perhaps there was some reason at the bottom of the belief that witches found something sympathetic in cats. Beliefs like that don't grow up from nothing."

"You've been in America, I think?" said I.

"I was there lecturing. Not the best way to see a country, being whirled about. I was there three months, and when I'd got accustomed to the scramble I was able to look about and take things in a bit; to see what a lot there was to note, and often to admire. I hadn't anything special to lecture about; I talked; they seemed pleased and were always very kind. I was met everywhere at the stations; deputations from literary societies, and so on. Often they carried me off to a man's lunch party, and my wife to a woman's, which amused us. Yes, I agree with you; Americans are much brighter speakers after dinner than we are; and at public meetings, too. We often start off with two or three interesting speeches, and then the whole thing is let down by some deadly dull ones. Why shouldn't we begin with the dull and end up happy? In America they don't seem to breed those pompous prosers, who *have* to be asked to talk—the sort we suffer so much from."

I hinted that he didn't take much interest in politics; at any rate in party politics. I knew he was keenly patriotic, stirred with "the love of the native land," to quote his own words.

"I'm not in agreement," he admitted, "with the policy of any one of the present three parties. After the war the Liberals had a great chance, but they missed it. I hate to think that it could be possible that England could go under. But I don't clearly see what the future's going to be, likely to be. Carthage, Venice, others—came and went. But England's different. They were not rooted in the soil; we are. Perhaps the solution is the encouragement, the increase of holders of small farms, owners of small businesses. Then Englishmen have had too great reliance on have-beens; they know how great they have been and believe that they must always be the same. The loss of the war would have been an awful disaster for Europe; it might have been a useful lesson for us. Germany? It was an amazing mistake that the German empire was not encouraged to break up when the war was over; but I suppose the politicians were thinking about reparations. I don't know that reparations aren't going to cost us too much—if we ever get any. Another great opportunity was thrown away. Germany had done a lot of beastly things; invading neutral countries, and so on. Their brutality was almost legalized at Versailles. What should have been done was to institute a better code of international honor and decency; a higher ideal of international chivalry. But instead—. Our future? If there does come a commercial disaster, a smash-up, it will start us asking awkward questions about the teaching of history. We've been taught that we have been going forward step by step. From point to point. From Canute, who brought something like order out of chaos, on to William the Conqueror, and so on, to Charles, when Parliament was made secure; William III who saved us from the Stuarts; the founding of the factory and commercial systems—. If we do come down with a smash, we'll be asking a question that won't be easy to answer—Has all the teaching of history been false? What will we answer if we're asked—Is this present the result of this wonderful past? Don't misunderstand me. I am an optimist, and always shall be. But a strong dose of pessimism is sometimes salutary for people who don't realize how happy they are!"

If Rothschild Ruled in Palestine

I suggested that money and the Jews were too powerful.

"Perhaps—we shall have a revolution to upset the banks," he answered, "to smash the too big bankers. Which reminds me of the story of someone asking Rothschild if he wouldn't like to rule in Palestine. He said: 'Yes, and I'd appoint myself ambassador to Paris!' "

Which I capped with the tale that when it was suggested to Rothschild that he might like to be King of the Jews, he replied promptly: "Thanks, no. It is much more profitable to be the Jew of the Kings."

G.K.C. told me that living in the country had brought home to him the fact that the really old pedigrees belonged to and the really old blood ran in the veins not of Lords and Ladies but of the smaller gentry and of what used to be called the yeomanry. He mentioned as interesting that there is a family in Beaconsfield who father after son have been solicitors since the time of James II.

"I've been thinking of writing a story about a—" and he told me about it, but—Hush! Time will show.

Then we crossed to Ireland—in thought. I being an Irishman wanted to hear what my victim had to say about the best country in the world.

"Yes; I've been to Ireland; was there this year. I find Dublin stimulating; there's an atmosphere there of mental give and take which I find exhilarating. Ireland's future is far more assured than ours, as I told an Irish friend. Once these revolutionary days are got through, as they will be, Ireland will settle down to prosperity; probably be a land of small owners, with bright, progressive headquarters in Dublin and other places."

G. K. C. Discusses the Irish Problem

It may seem that G.K.C. looks on the world, on men and women, with some touch of pessimism. Not so at all. His vision is too wide and his insight too deep for that; like every man with clear eyes he is a whole-souled optimist. He has written: "There runs a strange law through the length of human history—that men are continually tending to undervalue their environment, to undervalue their happiness, to undervalue themselves." He does not obey that law; breaks it often; knows that self-appreciation is good for man. As a writer he has chosen the more difficult part, and the better; for as he says: "The literature of joy is infinitely more difficult, more rare, and more triumphant than the black and white literature of pain." He has contributed largely to the literature of joy; his is the laughter of wisdom, not the wry smile of cynicism.

As I came away, his last words were:

"I've said nothing."

"Oh, *haven't* you!" were mine.

Our Government and Business

(*Concluded from page 4*)

Or take another situation: During these days of the creation of combinations and super-combinations, there is probably not an instance where the parties would not crave advice in advance as to whether they are safely "within the law." In one of our great industries there is now going on a "scrambling" of a number of great companies into one combination. Representatives of that group came before officials of the government for advice in advance. Their plan contemplated a combination of three great companies. The officials, after doing their utmost to function on the question, finally said that they thought the consolidation would be against the law, in that it would very substantially lessen competition in the states where the combination was to take place. Did this great business group accept the advice of the officials? Not for one moment. In the face of the statements made to them they, nevertheless, went ahead with their combination, contending that the government was wrong in asserting that competition would be lessened.

How is one going to determine such an issue in advance? It can't be done without injury either to the public or to the business interests involved, and without a growth of "more government in business" acting in a way which must necessarily be arbitrary.

Let us put ourselves in the position of the official who has to make the decision. He is human, he is appointed for a period of years to his position, and when he accepts it he generally burns his bridges behind him, severs all his connections, and steps outside the business or professional world. Naturally, he wants to be reappointed. Before him comes a proposition such as I have outlined. Suppose he is new in his position, active, full of courage, but inexperienced in public life. He looks the proposal over, listens to the *ex parte* statements of those interested and says to himself, that the plan appears all right on its face, so he tells the parties that they can go ahead. A year passes and some one in the competitive world or in the legislative life discovers that operation of the plan has suppressed competition and will eventuate into a monopoly, or that it has become distinctly unfair to the public or to competitors. Down comes criticism upon the head of the official. He sees his mistake, he becomes fearful, and while in this state of mind, along comes another proposition to be solved. By this time he has arrived at the stage Mark Twain described when he said, "Don't get more out of experience than there is in it."

"For example," said Mark Twain, "a cat will sit on a hot stove once, but having sat on a hot stove once the trouble thereafter is that it won't even sit on a cold stove."

Just so the official, like the cat, arrives at the cold stove stage. Then bureaucratic red tape and delay cross the threshold. The official says to himself, "Well, before I make any decision this time, I am going to use every possible means of information." If the case needs the investigation of business engineers, or economists, or accountants, or lawyers, or all of them, as is generally the case, the official will demand their assistance. In the absence of such assistance, which is usually unavailable because of a limited appropriation, it is human nature to take the line of least resistance, which is one of negation, otherwise known as "stalling," "passing the buck," and so on. Either the official must do this, or he must go completely over to the business interests, hoping that they will take care of his reappointment.

If the Federal Trade Commission is ever given the power to rule in advance for the thousands of trade associations and hundreds of thousands of corporations, instead of having a force of 315 persons, such as it now has, including lawyers, economists, accountants, clerks, stenographers, and others, it will need thousands of advisors. It will need, too, instead of an appropriation of one million dollars, many, many millions of dollars, and, even then, it will inevitably drift into bureaucracy, and become, instead of a prophylactic *for* business, a preventer *of* it.

Congress, with remarkable instinctive foresight, saw just this situation when, led by both Democratic and Republican members, it put into legislation the Federal Trade Commission Act and refused to give the commission power to rule in advance.

At this juncture it may be said that exceptional cases have been used here as illustrations. The types of cases, such as I have described, and some few other classes, are the only ones in which there can be any doubt as to whether the business world knows in advance about the law and justice of the practice involved. In such cases, the courts, under our form of government, must make the final decision.

The only point involved in such cases is whether the evidence sustains the complaint or not, and this evidence cannot be obtained except by examination of witnesses under oath. Would it not be absurd to suggest that an official body should rule in advance as to whether a business interest could indulge in such practices?

Nevertheless, the "let-us-alone" group, or those who desire to get under the protection of a governmental umbrella, insist that official bodies should do this very thing.

Romantic Rascals

(*Concluded from page 17*)

The end of that experiment was a riot in which the theater was nearly wrecked, and the Duke of Cumberland led the riot, laughing joyously as he charged here and there at the head of a mob, his sword unsheathed.

But there came a time when a Parliamentary career appealed to Montague. Did people say that he was a hopeless vagabond? Very well. Let them say. He would show them that he was quite capable of playing the gentleman with the best. Did folks say that he was one who chafed at restraint? Very well. He would show them that he was quite competent to make laws to restrain others. So, twice he represented his constituency in Parliament, playing his part as a dignified and eloquent lawmaker.

As for the qualifications of a gentleman of his day, there was one in which he shone. He could play for high stakes with the best. At Almack's, the fashionable gambling club, in company with that "greatest debater the world ever saw," Charles James Fox, he played from five o'clock one afternoon, steadily through the night, and on into the day following until six o'clock in the evening, at which time Mr. Fox lost twelve thousand pounds. But that was between gentlemen and equals. Another gambling duel had a different aspect, for the eye of Edward Wortley Montague was keenly set upon a certain Joseph Isaacs who proclaimed himself to be the luckiest gambler in Europe. So Isaacs was challenged by Montague to play, and lost heavily. Then Isaacs went to Amsterdam, but Montague followed him, challenged him, played him, and again beat him. Isaacs fled to Paris then, sore afraid, vituperating against his merciless pursuer who loudly declared that he would play him anywhere, at any game, for any stakes, and for any length of time. The real truth of that adventure has not seen the light. All we know is that something went wrong, and Montague, with a fellow member of Parliament named Taaffe, was imprisoned by the Paris authorities on complaint of the Jew, charged with cheating at play. However, the escapade did not prevent Edward Wortley Montague from being elected a member of the Royal Society on his return to England.

The last years of his life were spent at Padua, Italy, where he died at the age of sixty-two, a gallant rascal to the end, but a man with none of that conscious superiority about him which is the mark of the prig.

Mapping the Mississippi Valley

(*Concluded from page 13*)

the Mississippi which appeared on the maps of the great cartographer, Guillaume de L'Isle. Later Antoine de la Mothe Cadillac, the founder of Detroit in 1701, was made Governor of Louisiana in 1713. However, Louisiana was then for France the dumping ground for paupers and criminals and the final failure of France in America rests upon the character of her colonists. The English colonist with his axe was more powerful than the French adventurer with his sword.

The idea of La Salle and Frontênac and other inspired Frenchmen was of a great French arc encircling the English. The arc rested upon Quebec at the north and New Orleans at the south, with the keystone in the region from Detroit to the Upper Mississippi. But the human support in large and active self-supporting colonists, tillers of the soil, was lacking so that inevitably the great English colonies could not be restrained within the narrow boundaries set for them by the French. It is interesting to see upon the French maps that the English colonies are depicted as extending only to the Alleghenies while the great interior basin is La Nouvelle France or Louisiana.

A joke was perpetrated upon map-makers by the insertion of a River Long from Northern Minnesota to the Pacific Ocean. This river was the creation of the imagination of the Baron Lahontan. This soldier of fortune, after serving in the army in Canada, utilized his knowledge of America to write an account, New Voyages into North America. The river looked well upon the map, filling a space that was largely unexplored for another century. In consequence many map-makers from 1703 onward included Lahontan's river without question.

The peace of 1763 between England and France and Spain established the English in the region between the Mississippi and the Atlantic Coast. As far as the eastern tributaries of the great river are concerned these are quite correctly placed upon the maps from that time. However, the source and the western tributaries long remained unconquered and unknown.

Frontenac, inspired by the report of Joliet, sent Du Lhut in 1678 to explore the upper regions of the great river. Until 1680 Du Lhut continued in the region of the city which today bears his name and in the region of the "Thousand Lakes," quite near the source which he sought. Another French Recollect, Louis Hennepin, companion of La Salle, discovered in 1780 the Falls of St. Anthony, so named after the priest's patron saint.

Not until 1803 did the United States acquire the territory west of the Mississippi. However, once acquired the government immediately began exploration of the sources of the Missouri and the Mississippi. The Lewis and Clark Expedition of 1804 to 1806 placed the source region of the Missouri accurately upon the map. However, the Zebulon Pike Expedition to the Upper Mississippi made only a good beginning. In 1818, the region between Lake Michigan and the Mississippi, north of Illinois, was added to Michigan Territory. Michigan's able governor, Lewis Cass, determined to explore the source region. His expedition of 1820 made notable advance over that of Pike.

De Lisle's Louisiana. The voyage of Iberville in 1699 definitely replaced the mouth of the Mississippi where Joliet and La Salle (in 1683) had placed it.

As mineralogist with Cass in 1820 was Henry R. Schoolcraft who, in 1832, on a second expedition, reached and named Lake Itasca. The name was taken from the Latin "*veritas*," true, and "*caput*," head or source, by cutting off the "*ver*" of the first word and the "*put*" of the second. While others may have been to this lake, Schoolcraft put it on the map as the source of the river. A French scientist, Joseph Nicolas Nicollét, in 1836, made the necessary careful topographical study of the sources and between 1838 and 1841 explored the region between the Upper Mississippi and the Missouri. For the region of the upper lakes and the region between the Missouri and the Mississippi Nicollét's work became the basis of present-day maps.

By Spaniard and Frenchman, by native Indian and native American, the Mississippi was finally conquered. To France and to Spain, as well as to all the world, the products of this region go today, bearing witness to the fact that the wild dreams of wealth sought here by De Soto and La Salle have been found, not in mine and on beaver's back but in the soil and in the fertility and the power of the river.

"Speak! Speak! Thou Fearful Guest—"

A SMALL piece of iron; a thin plate of copper with notched edge, probably used as a calendar; a bit of steel, part of an ancient gun; a Spanish lance and a piece of ivory plate worn over the shoulder and on which rested the heavy gun. These, and a white man's skull with a few bones, are all that is left of what is believed to be one of Coronado's gallant Conquistadors, found buried in a cleft of rock in the canyon of Purgatory River near La Junta, Colorado.

Earl D. Scarlett, a World War veteran, discovered the gruesome remains while hunting for Indian arrowheads in the canyon. He noticed adobe in the cleft, high up, and wondered how it got there inasmuch as the nearest deposit was some distance away and on the level ground. Investigation disclosed the skeleton, together with the brown stain that had once been a gun, but now was nothing but dust and copper, with here and there a small piece of better-grade steel that had withstood the ravages of time and the elements.

Mr. Scarlett notified the Colorado State Museum at Denver. Expert physicians pronounced the skull that of a white man. Edward Butts, curator of the Daniel B. Dyer Museum of Kansas City, stated that the ivory plate was a protection for the shoulder of the man who carried the arquebus, as the heavy gun of that period was called. Mr. Butts believes it quite probable some of Coronado's men visited this district. The relic that points conclusively to Spanish exploration is the spear or lance point. It has sharp edges and holes for fastening on to the handle and was of the type carried by the Spanish of that date. Absence of more armor does not necessarily indicate that this was not one of Coronado's men. It is quite probable that some one of the weary explorers abandoned his heavy suit of metal when he became lost.

Identification of J. Wilkes Booth

(*Continued from page 19*)

Sergeant Boston Corbett, Sergeant Andrew Wendell, Corporal Charles Zimmer, Corporal Michael Uniac, Corporal John Winter, Corporal Herman Newgarten, Corporal John Walz, Corporal Oliver Lonpay, Corporal Michael Hormsbey, Privates John Myers, John Ryan, William Byrne, Philip Hoyt, Martin Kelley, Henry Putnam, Frank McDaniel, Lewis Savage, Abraham Genay, Emery Parady, David Baker, William McQuade, John Millington, Frederick Dietz, John H. Singer, Carl Steinbrugge, and Joseph Zisgen, each $1,653.85.....43,000

$75,000

The captors of Atzerodt were paid $25,000 and a $5,000 reward was paid for the capture of Payne.

The payments were made by separate draft of the Treasury Department of the United States, issued August 9, 1866, on Treasury Warrant No. 7724 and each of the paid drafts aggregating the total sum appropriated is now in the archives of the Government at Washington and may be seen by permission of the Secretary of the Treasury.

Identity of Man Shot—John Wilkes Booth

As to the identity of the man shot in the Garrett barn, Colonel Everton J. Conger, who, it will be remembered, was one of the detective officers present at the death of John Wilkes Booth, testified at the conspiracy trial in 1865 that he had seen John Wilkes Booth in Washington and recognized the man who was killed as the same. Colonel Conger, Lieutenant L. B. Baker, and Lieutenant Doherty, the three officers who were in command of the pursuing party, declare in their various statements and reports that while searching for Booth and at the time they found him they were carrying pictures of John Wilkes Booth for identification and used them for this purpose.

Colonel Conger testified that the man in the barn stated that he was lame. The three Confederate officers and the Garretts say the man who came was lame. Even Mr. Bates did not question the identity of the lame man taken to the Garrett place by Jett, Ruggles, and Bainbridge.

W. H. Garrett's statement that the man who came to his place was the man who was shot is in evidence. It will also be remembered that Booth while dying asked if Jett had betrayed him. A natural question for Booth but not for someone else.

At the Surratt trial, Lieutenant L. B. Baker testified that "there was a pin which Colonel Conger took from his undershirt after we tore open his collar." Baker then identified the pin, compass, diary, and knife which had been taken from Booth's body. Then Colonel Conger was called to the stand. He testified that after Booth was shot and before he died, he took a pin with a stone set in jet from Booth's person on which was engraved, "Dan Bryant to J. W. Booth." Colonel Conger stated that he had given these articles to Mr. Stanton, the Secretary of War. The pin referred to was exhibited and identified by the witnesses. Dan Bryant was the father of the minstrel show and a friend of the Booth family.

There has never been any question about the handwriting of Booth's diary. It was identified by a great many witnesses.

At the Surratt trial and the impeachment investigation of Andrew Johnson it will be remembered that testimony showed that Captain Jett saw Booth at the Garrett place after he was shot and before he died. Jett did not question, in the stories he gave for publication later on, that the man was actually the assassin. While Herold, when first taken from the barn, claimed that he knew nothing of "that man in there," maintaining that his name was Boyd (this was the name under which Booth and Herold were traveling) he did not afterward deny Booth's true identity. Boston Corbett, in a letter written to a friend and which was published in the New York papers, a few days after the capture, said, "When Herold spoke of Booth he called him Boyd, and told us that he had first met him but three days before. Nevertheless, on our way to Washington, he spoke of Booth by his real name."

On April 27, 1865, the day following Booth's death, an order was issued by the Secretary of the Navy permitting Surgeon-General J. K. Barnes and his assistant, accompanied by Judge Advocate-General Holt, John A. Bingham, Major Eckert, Assistant Secretary of War; William C. Moore, Colonel L. C. Baker, chief of the Secret Service; Lieutenant L. B. Baker, Lieutenant-Colonel Everton J. Conger, Charles Dawson, chief clerk, National Hotel; J. L. Smith, Mr. Gardiner, the photographer, and an assistant, to go on board the *Montauk* to identify the body of John Wilkes Booth.

Dr. J. Frederick May, whose story, "The Mark of the Scalpel," appeared in THE DEARBORN INDEPENDENT February 7, 1925, was brought on board by Surgeon-General Barnes and testified before seeing the body that if it were that of John Wilkes Booth there would be a scar upon the muscle of the left side of his neck, three inches below the ear, occasioned by an operation performed by Dr. May for the removal of a tumor some months previous to Booth's death. Surgeon-General Barnes testified at the conspiracy trial that he then examined the body and found the scar as described by Dr. May. Surgeon-General Barnes then cut from Booth's neck a section of the vertebrae through which the ball had passed and this was placed in the Army Medical Museum.

Charles Dawson, chief clerk at the National Hotel, where Booth had roomed, positively identified the body on board the gunboat, at the time of the autopsy on deck, according to Dr. G. L. Porter, army surgeon, by the initials "J. W. B." which had been tattooed in India ink on the right hand.

A contemporary picture from *Harper's Weekly*.
The autopsy on board the *Montauk* April 27, 1865.

(*Continued on page 28*)

(*Continued from page 27*)

Dawson swore that he had frequently observed the letters on Booth's hand while he was signing the hotel register, and on one occasion had said, "Booth, what a fool you were to disfigure that pretty hand in such a way."

It also will be remembered that Thomas K. Jones, who took care of Booth for Colonel Cox, stated that Booth identified himself by the initials "J. W. B." tattooed on his hand. Captain Jett at the conspiracy trial swore Booth had on his hand the initials "J. W. B." which Booth had shown the three Confederate officers at Port Conway for the purpose of identification. Sergeant J. M. Peddicord, the guard in charge of Booth's body on board the *Montauk* in a letter to the Roanoke, Virginia, *Evening News*, June 6, 1903, described the details of the post-mortem examination witnessed by him April 27, 1865, and states that he remembered the J. W. B. on Booth's hand.

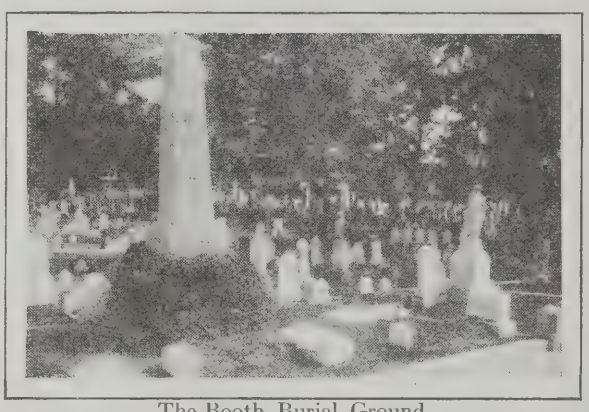
In 1869, when the body of John Wilkes Booth was removed from the old arsenal building and turned over to Edwin Booth for burial in the Booth family lot, assurance that the right body had been obtained was given by John Wilkes Booth's dentist who identified it from fillings he had put in some time before the death of Booth.

Blanche Chapman, an actress who had known the assassin, stated in a story carried in the Baltimore *Sun* in 1903, that she was present with the Booths at the burial after the exhumation of John Wilkes' body and cut off a lock of his curly black hair and handed it to his mother who divided it and gave back half to Miss Chapman.

While Booth, as Mr. Bates' book suggests, might have lost his diary, compass, knife, carbine, and pistols, and that miraculously all these things might have been picked up by an unknown man who was shot in the barn, it strains the probabilities to expect that the pin bearing Booth's name and fastened to his undershirt, the initials "J. W. B." tattooed on his hand, the broken leg which Booth sustained in his fall, the scar on his neck, which Booth had by reason of a surgical operation, and his dental work were all likewise transferred to the unknown.

The disposition of John Wilkes Booth's body has occasioned a separate outburst of controversy due to the varying stories told by General Lafayette C. Baker for the express purpose of misleading people as to the exact location of the first burial place of the assassin. Even after the truthful story was told, considerable confusion resulted because one writer would state that the body was buried in the "old arsenal grounds," while another would say that the burial took place in "the old penitentiary building," and unless the reader happened to know that both names designated the same place, it was naturally assumed that one or the other statement was untrue.

According to the testimony of General Baker given at the impeachment investigation of Andrew Johnson, he was ordered by the Secretary of War on April 27, 1865, after the post-mortem was made, to take the body of John Wilkes Booth from the gunboat late in the afternoon and convey it to the arsenal grounds and there turn it over to Colonel Benton, in charge of the arsenal, and General Eckert, the Assistant Secretary of War.



The Booth Burial Ground.

This is marked by a monument of white marble, set upon a base of gray granite which was erected by Edwin Booth, brother of John Wilkes. In this lot are buried three generations of the Booth family. The father and mother of John Wilkes are buried on the west side of the monument. This is marked by two headstones of white marble. On the east side close to the monument, beneath the ivy, is the grave of John Wilkes Booth, unmarked, in accordance with a stipulation of the authorities that the "actual location of the remains should not be marked by monument or mound." In the northwest corner of the lot is the grave of Asia Booth Clarke, a sister. At the south of the monument and next to the grave of Richard Booth, the grandfather of John Wilkes, is Rosalie, another sister. The remains of Frederick, Elizabeth, and Mary Ann Booth are buried under the monument. On the monument are the following inscriptions:
South Side:
Junius Brutus Booth, Born May 1, 1796, Died Nov. 30, 1852.
West Side:
In the same grave with Junius Brutus Booth is buried the body of Mary Ann, his wife, who survived him 33 years.
East Side:
TO THE MEMORY OF THE CHILDREN OF JUNIUS BRUTUS AND MARY ANN BOOTH
John Wilkes, Frederick, Elizabeth, Mary Ann, Henry Byron.

The following questions were asked General Baker (formerly Colonel Baker):

Q. Was it in the arsenal building, or in the penitentiary?

A. I call it the arsenal building, because it was used for arsenal stores. It was properly the old penitentiary, though it had not been used for a penitentiary for some time. It was occupied at that time for arsenal stores for fixed ammunition.

Q. Did you ever represent to anybody that you or some of your assistants took the body of Booth out into the ocean, tied stones to it, and sunk it?

A. I do not know that I ever did directly. I have been questioned a great deal in reference to that matter, and used to reply to the reporters somewhat at random. Very likely I did make such a statement. I do not recollect.

Q. Why do you say very likely you did?

A. I say that because, at the time the body was disposed of, I was beset by correspondents and others who wanted to ascertain where it was buried. The Secretary did not want anybody to know.

Q. Did you ever represent that you alone, with one other man, disposed of the body, and that no other persons on earth knew where it was?

A. My previous answer applies to this question.

Q. You will answer this question if you please.

A. I might have made that representation.

Q. Did you represent to anyone that the head of Booth was taken off and the body buried without the head?

A. Never in my life.

Q. Is it a fact or not?

A. It is not, so far as I know.

Q. Was the head buried with the body?

A. The last I saw of the body it was whole, excepting a section of the spinal bone where the bullet entered, taken by Doctor Barnes, Surgeon-General, and which, I believe, is now in the Medical Museum.

According to the testimony of Lieutenant L. B. Baker, he, General L. C. Baker, and two of the *Montauck's* sailors took the body from the gunboat, placed it in a row boat, carried it down the eastern branch to a little wharf attached to the arsenal, and then turned it over to Colonel Benton. The body was actually buried under the floor of a large room, the door to the room was locked and the key turned over to the Secretary of War.

In the *Columbian Magazine* for April, 1911, there is a story by George L. Porter, Assistant Surgeon of the United States Army, in 1865 and stationed then at the arsenal, that he and four enlisted men were the only persons present at the time the body was lowered into its grave.

Dr. Porter states that those present when the body was buried were sworn to secrecy regarding the happenings of the night until such time as necessity for secrecy had passed. That the body was carried to a large room 50x40 feet, which was being used for general storage quarters, buried under the floor and the door locked. He states that the reason for the attempted secrecy "may be found in the turbulent condition of public affairs, the general consternation and almost universal suspicion. The departments in Washington were demoralized; the clerks were not trusted to copy official orders that were written by the chief personally and transmitted directly by messenger." The Govern-

(*Concluded on page 31*)

What Is an Intellectual?

(*Continued from page 5*)

that the boys in the newspaper office, who are not noted for tender treatment, grabbed this copy and maliciously put it in the most conspicuous place they could find on the editorial page. My friend, who is very careful about his statements, told where he had seen the book, which was in the New York Library. Thereupon the enraged author hotfooted around there and made strenuous efforts to get it suppressed. My recollection is that the library people refused, and that the book is still there.

While in one sense all this seems disgusting, viewed from the trenches, it must be remembered that the intellectual is never so bad as he seems. His position may be defined in the words of a celebrated villain, Iago, who said:

"Who steals my purse steals trash; . . .
But he that filches from me my good name
Robs me of that which not enriches him
And makes me poor indeed."

Harding Davis as a "Highbrow"

One of the most distressing cases I know was the treatment of Richard Harding Davis. He was made to appear as a "highbrow" or intellectual, and many newspapermen, most of whom were secretly jealous of his success, never lost an opportunity to sting him with a paragraph. Two stories about him, neither of which was true, were eagerly printed and went the rounds. One was to the effect that among all the girl photos which reposed upon his dressing table was one bearing the legend, "She does not bore me," and the other was that he once registered at a hotel, "Richard Harding Davis and valet," and some rough person put after his line, "John Smith and valise." Unfortunately, Davis had an affected, egotistic manner, and apparently liked to talk of nothing but himself. I took luncheon with him one day at the Players Club just after he had returned from Russia where he had gone to report the coronation of the late Czar. His personal description of the coronation seemed to convey the idea that Richard Harding Davis, and not Nicholas, was being crowned, and that, indeed, the whole affair had been arranged by the Russian court, that he might possibly write something about it for the American papers. This sort of thing in Davis, however, was actually due to a kind of innate modesty. He blurted out things about himself to hide his embarrassment. He was never anything but a boy, taking delight in his exploits, with himself as hero, in precisely the same way that he wrote. His enormous dramatic or story-telling talent drew his own personality into the swirl of his talk. Once come to know him, his real character was evident. Of course, the newspaper boys saw him only on the surface, and many of them said and wrote mean things about him, when they would have gone to any length to have accomplished what he did.

The intellectuals, as they are somewhat vaguely known as a group, seem to have originated in Russia. This was in pre-revolution days, and they were obliged to be secretive, as many of them were Socialists, or disciples of Karl Marx. One of the most interesting of the Russian intellectuals was Prince Peter Alexeyevitch Kropotkin, whose "Memoirs of a Revolutionist" is one of the great books of all time. As the great European war broke in 1914, there was a pronounced stirring among writers, this incipient movement being largely due to the Paris studios, where in art the cubists were being born, and in poetry the free verse and imagist forms were coming into notice. Naturally, such an upheaval as the war brought to the surface many strange fish. Since the Armistice we have brought into being the word intelligentsia, a word that is not yet in the dictionaries, and of which no one seems to know the precise meaning. It seems to be, in general, a kind of lower form of intelligence than that of the intellectual. Apparently it has no singular form, which would seem to indicate that a member of the intelligentsia cherishes as his ideal to be "all things to all men."

The truth is that the mere cultivation of our intellectuals carries an enormous risk.

My intelligent readers will no doubt by this time perceive that I myself am a little bit "cagey" (to use a vulgar term) in my description of these lofty beings, but they must not forget that this is a pioneer article, subject, like the Encyclopedia Britannica, the World Almanac, and Rand and McNally's geographies, and other works of genius, to constant revision afterward.

Mencken Might Capture Blue Ribbon

H. L. Mencken, the distinguished editor of the *American Mercury*, who swings no mean typewriter himself, has failed to include the word intelligentsia in his remarkable book, "The American Language," and until he does, we shall be more or less in the dark. Mr. Mencken is probably, on all counts, our greatest all-round intellectual. In a prize contest of intellectuals, he would undoubtedly walk off with the blue ribbon. There is nothing to conceal about his methods. We see him, in his native habitat, very much like Irvin Cobb's goldfish. His ratiocinations and reflections, the delicate and precise workings of his organs of mental digestion, are all exposed. It seems strange that so many enraged people should go out of their way to misunderstand him, when his meaning is so plain. He is at heart, just like so many others of us who have goods to sell, a practical American. His sole business is to entertain. He would probably not decline the story-telling faculty, if it were offered to him on a platter. But not having it, he falls back on criticism. It would be wrong to criticize him for this, because, as a critic, he is not only the best we have, but the most useful. It is not at all necessary to tell people the truth to be a critic. On the contrary. It is only necessary to stir them up.

I do not know whether Mr. Mencken is a regular or even an occasional attendant at the round table at the Algonquin Hotel in New York or not. This table, which has become so celebrated as the sacred circle of the intelligentsia, has in itself achieved a sort of fictitious reputation, because, as a matter of common justice, the men and women who do attend are nearly all interesting, many of them intelligent, and some few of them, for example, Marc Connelly, positively handsome. A year or so ago a bright young man on the *World* selected Marc as the handsomest man in New York, and the reputation has clung to him ever since. My own private opinion, however, is that his side partner (collaborator with him of a season's success, "The Beggar on Horseback," George Kaufman) has, for looks, got Marc backed right off the map.

Others who attend the Algonquin are Alex. Woollcott, formerly of the *Times* and now dramatic critic for Mr. Munsey, Heywood Broun and his wife; F. P. A.; Burton Rascoe, the literary intellectual of the *Herald-Tribune*, Robert Benchley of *Life*; Robert Sherwood, (*Continued on page 30*)

What Is an Intellectual?

(*Continued from page 29*)

motion picture critic, also of *Life*, and Dorothy Parker. Occasionally there drops into the circle some "master of fiction," as we lowbrows put it; but, broadly speaking, the writers who make the big money are too busy making it to be regular attendants at intellectual feasts. These are mostly quiet men, who play about the world, getting first-hand material.

If we are to classify the intellectuals at all, however, and do it with any kind of accuracy, we must consider the locality. There is, of course, in every community, no matter how small, one or more intellectuals. If the community is large enough, a group is formed, and the latest vibrations from Paris, New York, Boston, and Chicago are duly recorded and assimilated. In the old days Boston, technically described as a state of mind, long held the supremacy as the intellectual center of the country. One of the funniest things in all American literature is the account by W. D. Howells, in his inimitable little book, "My Mark Twain" (almost the best bit of biography I ever read), of Mark Twain's celebrated speech on December 17, 1877, at the dinner given by the *Atlantic* staff to John G. Whittier on his seventieth birthday. Clemens, then a comparatively young man with an incipient reputation, memorized his speech beforehand. He dramatized the notables at the table—Whittier, Longfellow, Holmes, Emerson—as bleary outcasts in a log cabin, putting low language into their mouths. He couldn't stop, as he knew nothing else. The shock was terrible. "My sense of disgrace does not abate. It grows," wrote Mark to Howells later. Charles Dudley Warner tried to pass it off in the general gloom that followed by remarking, "Well, Mark, *you're* a funny fellow." It was not until nearly thirty years after that this immortal speech, in which our greatest humorist had taken a true fall out of the intellectuals, was recognized on its merits.

Chicago as a Rival of New York

Some few years ago we were all similarly shocked when Mr. Mencken gravely announced that Chicago was then the intellectual center of the United States. Those of us in the Metropolis who were privileged to sit at the feet of some young man who had been transferred from the Boston *Transcript* to the *Times* or *World*, or were receiving daily esthetic ablutions at the hands of some Harvard graduate who had matriculated in dramatic art, had a fixed idea in our minds that New York was secure in its intelligentsia—it could be reached from Petrograd or Paris several hours sooner than Chicago. Mr. Mencken's pronouncement, however, was, of course, final. The London *Times* had praised him. That was enough. Besides, he pointed out some of the men in Chicago who were preëminent. Since then the balance of intellect has shifted somewhat in favor of New York. Both Percy Hammond and Burton Rascoe have come on from Chicago. Mr. Hammond had a hard time at first, because his vocabulary was too intricate, even for New York intellectuals. He had associated with Chicago so long that only the elect could understand him. This was perfectly safe in Chicago, where Oscar Wilde's celebrated axiom, "I live in constant fear of not being misunderstood," was graven on the typewriter bar cases of all the young reporters who were then preparing for the glorious future by absorbing the works of H. G. Wells and Bernard Shaw.

As the case stands at present, and until we hear further from Mr. Mencken, I should say that between Chicago and New York the intelligentsia batting is about even.

Where a Semitic Strain Is Found

By this time my readers, who have without doubt become wary and suspicious of my footless attempt to define the intellectuals, will conclude that the case is hopeless, and walk out on me. Even if we are crude and quite possibly vulgar, however, let us go on for another lap and see if we cannot do a little better by a process of elimination. For instance, Booth Tarkington is not an intellectual. He writes stories which depict, with extraordinary fidelity, the actual life of the American people. Furthermore, he does not secretly depend upon indecency. I do not mean to imply that all intellectuals are indecent. Nevertheless, we must admit that there is a Semitic strain in a great deal of our intellectual stuff, and it must be admitted that there is a kind of subtle and poisonous indecency among certain Semitics which is not the kind of stuff we inherited from such men as William Bradford, Daniel Boone, William Penn, Benjamin Franklin, and other pioneers of America.

But to go over on the other side of the fence for a moment, there is a sense in which Edith Wharton, undoubtedly our greatest woman writer, is an intellectual. In thus making an intellectual distinction between Mrs. Wharton and Mr. Tarkington—and it must be admitted to her disparagement—I am fully aware that I am on delicate ground. The fact is that what Mrs. Wharton has gained intellectually by long sojourn in European atmospheres, she has correspondingly lost as a true portrayer of America. Where America—as in the life of its Metropolis and in its "high society"—parallels, or matches, similar European strata, Mrs. Wharton's touch is sure, her art unquestioned. But if America is different from any or all the other nations in the world, isn't that what we want to have portrayed for us? Isn't that genuine literature, as distinguished from the purely intellectual? And how can Mrs. Wharton do this when she abandons her country and goes elsewhere to get her facts? The same thing was true of Henry James. His work thus deteriorated constantly, as he grew older. He had enormous talent. He had a fine soul, as souls go. His conceit—especially about his dramatic performances—was the conceit of a four-year-old. But if he had lived here, and done as Booth Tarkington and Harry Leon Wilson are doing, he might have escaped entirely being an intellectual, and become as great as they are.

What I particularly dislike about the attitude of all so-called intellectuals, is their practice of throwing mud at their own country, when they really don't understand any more about it (or so much) than any man in a barber shop. Even Theodore Dreiser, who is a great writer in many respects, cannot keep his hands off, but showers contempt on this country. Quite naturally, compared with decadent European standards, we are common, ordinary, vulgar, and so on. I myself hate a lot of things we are doing, just as any man hates certain primitive things in himself.

Something Lacking in Intellectuals

But it certainly requires what so many intellectuals have not, namely common sense, to see that many of the things we are accomplishing in this country—as wasteful, as indeed sinful as we are—are things which have never before been done in the history of mankind. Mr. Mencken, for example, would scorn to use the word *love*, except in some derisive or offhand intellectuality. He couldn't use it in any other way, because if he did, it would damage his reputation for tartness by so much. Therefore, do you not see quite plainly that a reputation for any particular kind of thing is dangerous, because it is limiting? If such a thing can be imagined as Mr. Mencken going to a Methodist camp meeting and being converted, nobody would ever know it—at least the probabilities are that nobody would ever know it—because he would be ashamed to admit it.

Miss Agnes Repplier, who is by far the best woman writer we actually have among us in America (in spite of her undoubted intellectuality), would not necessarily be classed as an in-

Mr. Ford's Page

(*Concluded from page 11*)

has a more comprehensive view of world policies than had the great statesmen of a few decades ago.

But to allege this as the source of nervous disturbance is rather extravagant. For these things are not new to all. The generations overlap, and boys today are accepting as their natural daily companions—as natural as the clouds and trees—marvels which their fathers never guessed. A generation born with these things to hand will grow up naturally with them; these wonders will be the common daily tools of the new era, with probably still greater tools to accompany them, and the use of them will be no more a nervous strain than was the use of the stagecoach or the sailing ship generations ago.

It seems perfectly reasonable to say that the charge that newness causes nervous strain may be pushed too far, much too far. All this newness is itself *the normal march of mind*. Fast as the world may be moving, it is not moving any faster than human minds have moved. Everything we have is the work of some human mind. The pace of the age is the pace set by men like ourselves. It is not as if we were being pushed by cosmic forces that are not geared to our gait; this vast panorama of modern progress *is* our gait. Else we should not be going it. It is human. It is natural. It is the product of our living contemporaries.

If we were being dragged in the wake of brilliantly blazing stars of genius whose brightness blinded and whose heat shriveled plain folk, that would be different. But what we have is the result of the most sane and commonplace processes, the result of the most calm and sober setting of plain fact against plain fact. Indeed, it may be said that we have nothing new, amid all our wonders, but a new combination of old things. Why, then, should the newness be charged with being a nervously destructive force in our life?

It is not the onmarch that hurts, but the backpull. There is, unfortunately, a queer quirk of the mind by which it feels that it cannot be loyal to the old without being antagonistic to the new. And there the antagonism begins, and there also is the source of the disjointedness of life which leads to nervous irritation. The voice of wisdom says to us: *Keep the Old and Accept the New*. What was good and useful in the old can never pass, what is worthless in the new cannot remain. The very creators of the new are but preserving the old in more enduring forms.

Sapiro's Peach and Fig Growers

(*Concluded from page 23*)

the wheat-producers, is merely a subsidiary to what he is pleased to call "an international pool."

There are a score of other and somewhat minor factors of failure in the Sapiro Plan associations, the majority of which are inherent in the plan itself. It is doubtful if the most honest, competent, and careful business man in this country could make a success of the operation of a coöperative marketing association if he followed the Sapiro Plan. Certainly no sane business man, intrusted with the direction of the operations of a firm of several partners would undertake to direct those operations on this plan. The farmers of the United States are beginning to realize, as the grain-growers of Canada apparently did realize immediately when Mr. Sapiro appeared on the scene, that they are in business for themselves, and are not sheep producing wool for alien shearers. Having arrived at this point of view, they are rejecting in ever-increasing numbers the plan offered by the enterprising and industrious, but strictly non-agricultural Mr. Sapiro. In this early part of 1925, after a disastrous decade of Sapiro Plan "coöperative" experience, there is a large and apparently permanent rainbow in the sky of agricultural marketing. It points directly away from the Sapiro Plan, from Jewish influences, and from internationalization of American agriculture to the comparatively simple system of business methods applied to the nation's greatest business.

Identification of J. Wilkes Booth

(*Concluded from page 28*)

ment feared that the body of Booth, if secured by Southern sympathizers, might be used as a rallying point to revive the war. Fear was the motive behind the false reports.

In 1867 it became necessary to tear down the building in which the body was buried and it was moved to one of the large storehouses on the arsenal grounds, the bodies of the four conspirators, Mrs. Mary Surratt, Louis Payne, George Atzerodt, and David Herold, who were executed on July 7, 1865, were also dug up and placed beside it.

Edwin Booth, to please his mother, requested that the body of John Wilkes be turned over to the family. This was done February 15, 1869, and it was taken to Baltimore, identified, as already has been described, then reburied in the family plot in Greenmount Cemetery, Baltimore, Maryland.

The trio of contenders for the assassin's infamy, James Glasgow Armstrong, John St. Helen, and David George, may now rest peacefully, undisturbed by myth makers. They were indeed romantic rascals, ego-maniacs, who have enjoyed their precarious places in history. They are now in the category of historical fiction and there let us trust they will remain.

What Is an Intellectual?

(*Concluded from page 30*)

tellectual, except by those who are unaware of her fine spiritual qualities, which, in her writing, are always duly restrained. Here again we are on delicate ground. One can scarcely read the essay, "The Idolotrous Dog," in her latest volume, "Under Dispute," without on the one hand admitting and admiring her literary technic, and at the same time being sorry for the didacticism which makes her declare that—speaking of vivisection—"None but the supremely ignorant can deny its usefulness."

The truth is that the mere cultivation of our intellects carries an enormous risk. If we make this an exclusive process and fail to keep in the thick of our ordinary occupations, such as marrying and having children and playing games and being generally foolish—then we are bound to lose out in the long run, just as Henry James lost out. Nothing is so important to our intellectuals—whoever they may be—as themselves and their daily utterances. And nothing is so unimportant to everybody else.

As an experiment, last year, I wrote an anonymous letter to a man whom I selected as the biggest highbrow (I still like that word) in England. He was the editor of a very exclusive periodical, a real literary Brahma of the highest caste, and the author of books which had attained world-wide celebrity. I wrote him frankly that I was just an ordinary dub American without any particular education except what I had picked up, and that I was writing to him to ask him why, just because he was British, he considered himself so superior. Of course, I did this because I wanted, so to speak, to get a rise out of him. Then I asked him certain questions about religion and philosophy. To my astonishment he wrote back a long personal letter, one of the most charming letters I ever read, saturated with genuine humility, and, quite ingenuously taking me to task for harboring for a moment the thought that he, or any other "Britisher," should think himself superior to an American. Here, undoubtedly, was a man whose intellect had not warped his spirit. And that is the way it ought to be.

(*To be continued*)

The Last Wilderness in Superior Forest

(*Concluded from page 20*)

tions cooped up in cities, would do with such a spot!

Forests of white pine and Norway pine stand upon the shores of many of these lakes along the boundary. Frequently, outlined against the green depths, there is the shining silver birch, and occasionally a rare island where clumps of the birch have taken entire possession. Poplars are common, and there are considerable quantities of spruce. There is balsam for the bed of the woodsman, and the other native trees and plants of the north woods are represented.

Great cliffs of rock tower above many of the lakes, and in some places there are rolling, mountain-like ranges with thousands of great boulders. In other places the banks are not so imposing, and the forests grow to the water's edge. Hundreds of wooded islands are scattered over these lakes, ranging from mere "flower-pots," supporting a pine or two, to veritable mountains of rock supporting small forests.

The Haunt of the Beaver

AS YOU paddle along from one lake to another and marvel at the wild, unspoiled beauty of it all, it is not hard to imagine that you are transported for the moment to the heart of the old America as it was before the coming of the white man. To think, Kentucky and Tennessee, Virginia and Vermont—these and many other states—had such forests, where now there are idle wastes!

As you glide along, a beaver swims in front of the canoe, looks curiously at you and submerges with the customary sharp slap of his broad, flat tail. A little farther along, a group of cub bears are playing at the edge of the water. Before you get very far in the forest, deer will scamper from your path, and if you are fortunate you may come upon a moose feeding in the waters. In every way, here is a piece of the old wilderness.

A bit of the old wilderness! Nature lovers and conservationists are determined that the Superior Forest region shall be preserved just in that way. Man has despoiled or altered in some form nearly all the great natural beauty spots with which this country was enriched, but this one region they are going to preserve as a real wilderness.

One would think that there could be no dissenting voice to this. Only this year, a plan was proposed for the building of roads through the heart of the forest. The proposal looked harmless enough, and probably was well meant.

But naturalists, conservationists and lovers of the outdoors from all parts of the country rose in one general protest. The Izaak Walton League marshaled its forces against the project. To build roads through the forest, said these opponents of the plan, would destroy its usefulness as a wild-life sanctuary. It would open the way to cutting some of the timber within the area of the forest, and soon the region would cease to be a wilderness.

"Can't we have this one bit of wilderness as God left it?" they asked.

So numerous were the protests that the U. S. Forestry Department held a hearing at Duluth. Sponsors of the project were hopelessly outnumbered, and the plan was dropped.

However, the men fighting to keep the forest intact didn't rest on their oars there. Appreciating that further attempts likely will be made to encroach upon the forest, they formed a permanent organization, to be known as the Superior National Forest Association, to fight for its preservation. Paul B. Riis, Rockford, Illinois, chairman of the wild-life preservation committee of the National Institute of Park Executives, is president. Will H. Dilg, president of the Izaak Walton League, Dietrich Lang and others are active in the movement.

While protecting the forest from encroachments, the new organization is seeking to extend it. The Superior National Forest contains about 1,250,000 acres of land within its borders, but about a third of this land, scattered through the forest in tracts here and there, is owned by private interests. The government is being urged to purchase these private tracts and consolidate all the land within the forest boundary into the public domain so that no part of this natural preserve shall be jeopardized in the future.

A Vigorous Protest

IN ADDITION, the government is being asked to arrange for the purchase of several million acres of land adjoining the present forest. This land, much of which is of the same general character, is not suitable for settlement and can be purchased for a nominal sum. Consolidation and extension of the forest in this way was advocated by a long list of witnesses called before a United States Senate special committee on forestation at Cloquet, Minnesota, recently.

One thing is certain, this last wilderness isn't going to be despoiled without a tremendous protest from a small but active group of men who appreciate its value. Where else in another generation can one find such interesting insights into the wild life of the country? Where now, for that matter, is there such a sanctuary undisturbed by man?

Take the marten, for instance. Like many of our other animals, the marten has been all but wiped out because of the great demand for his fur, but in the Superior Forest region he still finds a refuge. He needs protection if he is to survive.

The marten, curious as it may seem, indirectly has a beneficial effect upon the growth of forests. He lives chiefly upon the red squirrel. Jumping from branch to branch in the tree tops, he literally runs down the squirrel and kills it.

In one region in Minnesota, there were numerous white pine trees, but they did not reproduce. Red squirrels were numerous in the neighborhood. Finally a forester reached the conclusion that the extermination of the marten in the neighborhood by the trappers had been responsible indirectly for the failure of the trees to reproduce. The red squirrels had become so thick that they ate practically all the seeds of the white pine.

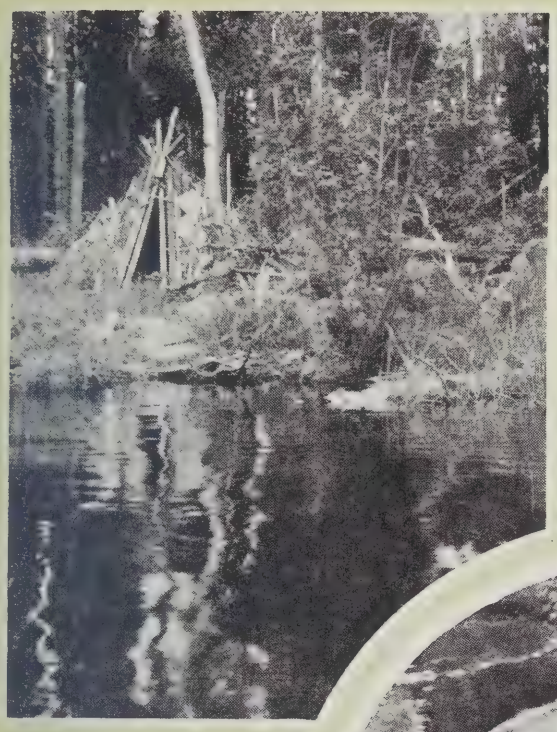
A Recreational Paradise

OTHER animals which have led a precarious life in other sections have increased in number within the forest, where hunting and trapping is not permitted. Many of them have lost much of their fear of man. It is not unusual to find squirrels and chipmunks around the ranger stations which will eat out of the outstretched hand. Occasionally deer can be won over by such kindnesses on the part of the rangers.

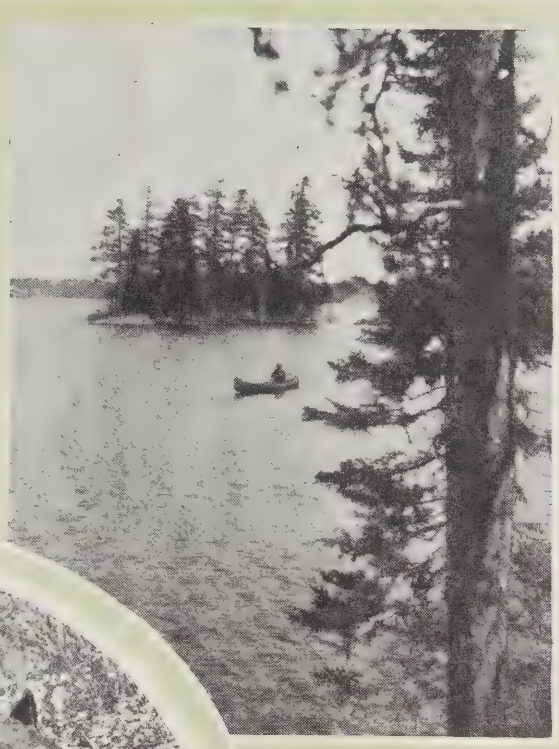
Even the moose becomes less wild. Some time ago there was a bull calf near Rainy Lake which had so lost the fear of man that it would eat salt out of the hand. This animal had been caught in the logs, and when released by a settler had been kept in a barn for a time. This suggests that even the moose, if shown a little kindness, might become somewhat more tolerant of the presence of man, as the deer is, for instance.

As a recreational paradise, the region is just as important as it is for a game sanctuary. Where, in another generation, can a man take a canoe and get out into the wilds away from all the haunts of man? Friends of nature and conservationists shake their heads sadly when that question is asked.

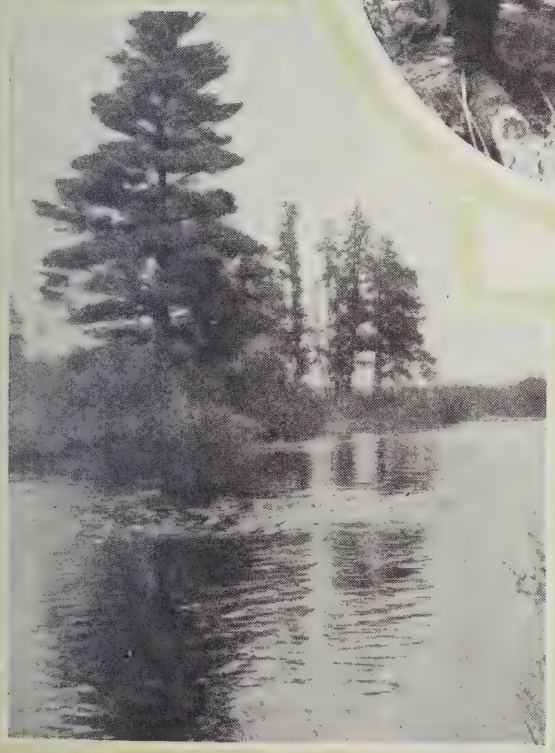
The chain of lakes along the International Boundary formed the earliest highway of commerce into what is now Northern Minnesota and the adjoining region in Canada northwest of Lake Superior. The early traders from Canada made their way over the nine miles of the Grand Portage from Lake Superior, paddled their canoes up the Pigeon River and the chain of lakes beyond, traded with the Indians and brought back great cargoes of fur. Lovers of wild life hope to confine travel through the Superior Forest to the canoe. This last wilderness, they say, must be preserved just as it is.



Vestiges of Indian life add to the interest of the region. Here is an old Indian camp on Lake Insula.



Each island of rock jutting out of the lake has its clump of trees. This is Clear Lake.



Isn't it worth while to preserve trees like this wonderful white pine? The picture was taken on the Isabella River in the Superior Forest.

You won't go far in the Superior Forest region until you find deer. Afraid? Not a bit of it.

One of the chief objects of this paper is to point out to its readers the opportunities for usefulness that lie everywhere about them, and advise how they may be used to their best advantage. It is unwise and selfish to refuse to share with others the opportunities we are able to see which are waiting for someone to take hold and build up. This paper exists to spread ideas, the best that can be found. It aims to furnish food for thought. It desires to stir ambition and encourage independent thinking. You will find here various writings from week to week. You may not agree with them all. But they will probably help us think and exchange ideas worth while.

Nearly fifty per cent of the total output of asphalt in the United States is of Mexican origin.

Among the enemies of the telephone are bears which climb the poles to find the "bees" they hear buzzing and break the insulators; the gray squirrel that bites the lead cable, and the white-headed woodpecker of the West that weakens the poles with his constant pecking.

This Issue

Mr. Ford's Page this week discusses the effects of efficiency—a much disliked term that stands for a really beneficial thing. (p. 11)

The dean of American humor editors discusses humor and tells what makes it humorous. It's a secret that few have come so near to surprising as Tom Masson. (p. 6)

In the Spring everybody's fancy turns to thoughts of travel, if only via the moving van. So that in this issue you may go to Oxford in sight of Magdalen Tower (p. 22), or to the Ireland of the Gael, an article written exactly as it ought to be (p. 16), or to Gloucester with its fishing smacks and dories and bronzed salt-water men (p. 20), or to North Carolina where they celebrate Independence Day on May 20, because on that day the Mecklenburg Declaration was made, the first fundamental assertion of American national rights. (p. 19)

There are also farther roamings afield. Hal Walker who went with the French official expedition to the Orient tells more of his wonder voyage to Religion's cradle (p. 29), while M. B. Hood carries the reader to the Panama Canal for the purpose of showing him that the canal is already becoming too small for the work it must do. (p. 24)

As everyone knows we are overrun with laws. Long ago this paper suggested a special session of Congress to do nothing but repeal laws. Tom Everritt (p. 3) gives pertinent facts and figures.

There's a lot of nonsense printed about the family budget, which is why we print this very sensible article by a southern woman who does not expect the impossible. (p. 5)

All who keep up to date know about Sir William Orpen, artist, who lately visited this country, but few know him so intimately as Hugh A. Studdert Kennedy, who admits us to that pleasant intimacy. (p. 2)

The "Weeping Widow" as the Faker's Friend is ably described. It may save you some money and humiliation to read this article. (p. 13) In this case 13 is lucky.

The Old Hornbook, with one of Fitzgerald's old-modern woodcuts. (p. 12)

Mr. Gregg tells about the amazing love of city people for flowers. Come to think of it, it's true. (p. 32)

Billy O and I

Some Pen Pictures of a Great Portrait Painter

By HUGH A. STUDDERT KENNEDY

With apologies to Sir William Orpen

SIR WILLIAM ORPEN, R.A., at work on his portrait of Lord Leverhulme, which occasioned a controversy between the peer and the painter.

AND so Sir William Orpen has brought out a new edition of his book, "An Onlooker in France." It is "a revised and an enlarged edition"; but it has, so the reviewer thinks, and I am sure he is right, all the freshness and fairness, the pathos and wit, of the original unimpaired. And the pictures—beautifully reproduced—whether they be of the Tommy he loved so well, or the "frock coats" he loved so indifferently, are all great achievements. And yet, as I browsed through this review of it the other evening—such is the perversity of the human mind—my thoughts slipped past the reviewer's intriguing phrases and brilliant instances, and I suffered the fate, if so it can be styled, of Poor Susan. You remember—the corner of Wood street, the singing of the thrush, and the "vision of trees."

There was but a momentary glimpse of Sir William Orpen, the great artist, but a momentary recollection of his long line of triumphs. They flashed past like beautiful gardens seen from a train window, and before I knew where I was or what I was, why, I was a boy again, and we were walking along a shady country lane together—Billy O and I.

And then I knew I was where I wanted to be. It was far removed, but what a freshness and a sweetness there was about it all; long years before the war; long years before the motor car, when the fastest moving thing on the road was the bicycle, and the horse car was still to be seen everywhere on the streets of Dublin. For that shady country lane was, of course, not far from the beautiful city on the beautiful bay. It wandered out from one of the little towns which dot its shores, past wonderful walled gardens, under wonderful green trees, through wonderful open spaces, on to the next little town, and Billy and I and the rest of the "gang" often wandered along it.

Below—"The trousers sagged and shifted, but Billy played on and on."—From a sketch by Sir William Orpen.

But what of the Billy of those days? I have before me, as I write, a letter from him, or rather, from Sir William Orpen—looking back,

> "back," as he puts it, "to those old days of peace, before poor Europe was blackened by its night of war—aye, back to the blinking eyes of L——, the pink cheeks of V—— and D——, to N—— S——, A——, L——, and W—— M——, not to mention M——, L—— and F——; 'The Club'—the terrible and serious games of lawn tennis (I must say I forget about the trousers, but I am sure it must be true).
>
> "Yes, S—— and B—— were great places then; they may be now, but when I go back and walk the old roads I am stared at by strangers—those who knew Billy have passed to other climes, or have gone up into the blue sky to better things."

Well, it is, of course, all true, and yet, if Sir William Orpen will forgive me, as I know he will, I have a mind to go back there, and walk the old roads with Billy O, "the same little Billy as of yore"—Sir William Orpen assures me that is so.

And the Billy of those days *was* little; a small boy, rising fifteen or so, with a tousled fair head, an imp-like boy, forever doing quaint things; an artist, even then, going into Dublin every morning on the 8:45 or the 9:16 to art school, and coming out again, each afternoon, with the pockets of his own or somebody else's coat—for Billy had a fine disregard in such matters—bulging with sketches. All day, Billy would draw and sketch and paint, doing wonderful things past our comprehension, but every evening, in the summertime, Billy played tennis.

We all played tennis in those days. And how we played! The deep, dark seriousness of it all! Sir William Orpen will surely remember the full-dress debates held by the gang "down at the club," when the twilight of the summer evening had given way to the dusk of the summer night; when the dew lay heavy on lawn and leaf, and the corn crake in a neighboring meadow was the only sound above the stillness. In all these conferences, and at all times where tennis was concerned, Billy was our "hope." He was something more than the infant prodigy of the gang. Not only could he give points to, and lick us all, but, like a little bantam cock, he would take on anybody of any size, and put up a wonderful fight.

And so it came about at one of these conferences that the great plot was hatched which resulted in the incident of "the trousers," (Concluded on page 23)

Too Much Law in the United States?

Most of the Lawyers Themselves Say That There Is and Suggest Remedies

By TOM EVERRITT

THE widespread agitation against "too much law," has taken hold of the popular mind this year, during which the legislatures of many states and of the National Government have been in session producing more laws in addition to the more than 1,800,000 (estimated by experts) now on the various national, state, and municipal statute books. It would appear there must be some solid foundation for its unusual intensity.

Do the people of the United States suffer from too much law, as has been charged by lawyers, legislators, and laymen?

The importance of the opinions of presidents of state bar associations in the United States, which are given in this article, should not be underestimated; for who, better than they, is in position properly to gauge the effects of the perennial increase in the statute laws?

Fifty Per Cent May Be Obsolete

During a few months every year, the average citizen observes the operations of the legislators, both state and national, engaged in lawmaking, and undoubtedly is firmly convinced that they are overdoing the job.

Excess of laws is not a new phenomenon. It is age-long in its demonstration.

Holmes, in "The Age of Justinian and Theodora," says: "Before the sixth century, the legal archives of the Empire (Roman) had been swollen to such proportions that it had become an almost impossible task to thread the maze of their innumerable enactments. . . . The resultant growth was capable of bewildering the most acute of legal minds."

The uniform continuation of this evil, so asserted by the average citizen, down to the present time, has led to an almost universal condemnation of our lawmaking bodies; but it must be said that, so far, few have suggested workable remedies to prevent the immoderate use of their constitutional powers.

The presidents of the state bar associations of the forty eight states were asked:

1. Total number of laws on statute books of the state.
2. Approximate number that are obsolete.
3. The desirability or workability of so large a number of laws.

Their replies are not those of loose-minded or irresponsible men, but are those of trained mentalities. Not one of forty who answered the questions denied that there is "too much law." To the contrary, the replies warmly condemned, although thoughtfully, the practice of excessive lawmaking to which legislators have universally succumbed.

Owing to lack of space, it is obvious that only a limited number can be here quoted. These were selected from the standpoint of geographical locations so as to give a general view of the question from many divergent angles.

George F. McNoble, president of the California State Bar Association, has this to say: "I have all of the statutes from 1850 up to date in my office, but it would take a very long time to go over all of them and segregate them, to tell those that are in effect and those that are not in effect. It is no doubt likely that 50 per cent of the laws have become obsolete. It is true that in such a countless multitude of laws, it is impossible to know what the law is. There are too many laws, but this arises from the fact that there are a great many human desires, and so long as people want these, they will resort to the legislature to have laws made covering the topic. The remedy must rest with the executive, who must have strength enough to veto proposed laws that are unnecessary.

"I just returned from Sacramento last week, and they were grinding out laws there at the rate of twenty-five or thirty a day. Each member seems to think that his proposals are of the greatest necessity. Lawmaking appears to me to be an abuse that we will always have with us."

Respecting the assertion by Mr. McNoble that too many laws arise from "a great many human desires," Elihu Root, at the thirty-seventh annual meeting of the American Bar Association at Washington, D.C., in October, 1914, made a speech touching upon the same subject, in which he said: "Laws affecting the conduct of life and affairs of the people ought not to be passed because it happens to occur to someone that it would be a good thing to make a change." Thus, we have two eminent viewpoints.

Constructive Thinking Is Wanted

Predicting that the time will come when we will have fewer but better laws, George L. Mayberry, president of the Massachusetts State Bar Association, says: "I think we have too many laws, but I think the problem of how to get along with fewer statutes is one which the American people can solve only gradually. The complex conditions of modern life probably require more statutes than were formerly needed, but they do not require such a flood of them as we are at present blessed with. What is needed is more careful thought and the use of more imagination, combined with practical sense in the framing of statutes and visualizing in advance their operation.

"Of course, 'politics' can never be eliminated from government because government is 'politics'; but, as the difficult problems of the community increase in variety and scale, the amount of constructive thinking and sound judgment in the representative bodies of the people must increase in proportion. The government cannot rest merely on declamation and legislation. It requires hard thinking, judgment, and self-restraint, both in and out of office. I am optimist enough to believe that these will be gradually forthcoming to meet the needs of the people. The result, among other things, will be less and better legislation."

Large Number of Laws Undesirable

The thought conveyed by Mr. Mayberry in his expression, "The complex conditions of modern life probably require more statutes than were formerly needed," seems to bear out the idea advanced by several writers upon the subject that every addition to the popular element in government—"complex conditions of modern life"—carries with it the necessity for passing additional laws to meet the social and other conditions caused by such augmentation.

Without question, it is true, as many historians claim, that the more government is vested with law-enforcement, the more centralized does government become.

The contention of Mr. Mayberry as to the "complex conditions of modern life" being the probable cause of more laws than were formerly needed, is also made by Walter S. Foster, president of the Michigan State Bar Association, in the course of a detailed statement. He says:

"It must be perfectly obvious that a large number of laws are undesirable, but I trust you will appreciate the plain difficulty in carrying out the theory that we have too many laws, therefore we will cut them down. It is also clear that there is an almost universal tendency to regulate by law matters which were formerly left to the decision of the individual. In the great majority of such instances, such laws seemed to be necessary, to protect the unfortunate members of our community who have, by reason of congested environment, and strenuous competition for a livelihood, been unable to protect themselves and their

families. A generation ago, our housing codes left it to the individual to construct his dwelling as he desired, or to rent such quarters as he wanted to; but now humanity demands that the state intercede for the benefit of the community and insist that dwelling quarters have certain qualifications as to light, air, and sanitary conditions.

"This is but one conspicuous example of a new class of laws which constitute a large number that seem to be necessary under modern living conditions.

Lawmaking as a Mania

"I appreciate the importance of the article you are undertaking, but I trust that by the large number of laws which are in force, you will not be misled into an unsustainable position that we should, therefore, take the ax and arbitrarily weed out a certain proportion. It must be apparent that legislatures could perform a real service by regularly wiping off the books those laws which are repealed by implication, or are, in fact, inoperative. In other words, there should be no laws left upon the books which are not enforced. .

"I would estimate that we have about 17,000 sections in force. I think there are a considerable number of laws obsolete in the technical sense of out-of-date and universally ignored."

How far shall the laws extend in regulating the behavior of citizens? To what extent should the state interfere with the action of its citizens?

It must not be overlooked that, in considering whether there is "too much law," the average state legislature is confronted by many problems, serious and of great importance, that must be met by the passage of laws designed legally to solve each specific case, insofar as legal solutions may be found.

Examples of these problems are: public health, morals of people, waterways and power, commerce within the state, regulation of business and manufacturing, industrial controversies, age and hours of workmen, child labor, agriculture, housing, securities, highways, licenses (medical and other professions), game laws, and many others of equal importance to the citizenry.

It is generally admitted that more legislation is demanded of lawmaking bodies — quite outside the subjects enumerated above—than can be met by their lawmaking powers.

Charles O. Bailey, president of the South Dakota State Bar Association, freely expresses himself upon this and other phases of the subject. He says: "Personally, I regard the mania of the American people for enacting legislation to be a most interesting psychological problem. The average American citizen is insistent upon the enactment of a multitude of laws, but seems to care nothing for the enforcement of the laws after they have been passed by the lawmaking bodies. The result is that the statute books, both Federal and state, are filled with a multitude of statutes which are not enforced, which could not be enforced, and which nobody wants or expects to be enforced.

"I venture to say that if all the men, women, and children throughout the United States who have violated some law during the past three years (that is, within the statute of limitations) were serving penitentiary or jail sentences for their offenses, there would not be enough men and women left outside the penitentiaries and jails to act as guards to those confined within those institutions, and even of those at liberty a very large proportion would be out on bail awaiting the determination of their appeals in various Appellate Courts.

"The prevailing disregard for law is not the creature solely of the much-discussed Volstead Act. It arises from the insistence by the public (or by a noisy minority of the public) upon the enactment of laws which cannot be enforced and never will be enforced. It is bad enough to have on the statute books laws which are openly disregarded by the public at large, but the situation is not nearly so bad as it would be if any real attempt were made to enforce such laws. In disregarding the multitude of laws which are annually enacted, the people of the country are simply following the 'easiest way.' The reformers have their laws, the laws are never enforced, and nobody is satisfied.

"In South Dakota, the Revised Code of 1919 is comprised in two large quarto volumes containing 2,795 pages. It is divided into 10,670 sections. In addition, there are the Session laws of 1919, containing 366 statutes in 454 pages; the 1921 Session laws, containing 425 laws in 559 pages; the 1923 Session laws, containing 312 laws in 333 pages, and the 1925 Session laws, containing some 300 or 400 more laws.

"Perhaps five or ten per cent of the total laws in the Revised Code of 1919 and subsequent Session laws have been repealed; but the rest of this vast mass of legislation is still in effect in South Dakota."

A Lawyer Suggests a Remedy

Joseph C. Stone, president of the Oklahoma State Bar Association, rather gloomily says: "I do not know the number of laws on our statute books, but I do know that there are more than we need. The legislature is now in session making others.

"I do not know, even approximately, the number of statutes now obsolete, but there are some.

"So many laws are neither desirable nor workable. The many ills incident to human frailty cannot be cured by mere statutory enactment."

In addition to legislative enactments, state Supreme Courts formulate rules of practice that are the equivalents of statutes, thereby adding to the tangled mass another skein or two.

George C. Manly, president of the Colorado State Bar Association, disagrees with that custom; but he believes the remedy for the whole predicament is to elect more lawyers to legislatures. He says:

"It looks as if the present legislature would enact fewer laws, than usual, which will be a blessing if it transpires.

The statute laws of Colorado are comprised in Compiled Statutes of 1921, consisting of 2,471 large pages, and of the Session laws of Colorado, consisting of about 600 small pages additional. I have no way of determining just how many bills for acts these laws include. It would be larger in Colorado than in most states because our constitutional provision requires only one subject to be treated under one title.

Too Many Laws Mean Confusion

"I do not believe it can be fairly said that any large number of these laws are obsolete. A good many of them ought to be repealed because they were foolish in their original contrivance. I think there are too many laws denouncing certain acts as misdemeanors where a civil remedy would be equally effective.

"Some years ago, the Supreme Court was given the power to formulate rules of practice which would have the same effect as statutes. I think that was unwise. The Supreme Court has attempted to modify several things expressed in the code, and some of the changes were so unsatisfactory that the Supreme Court had to withdraw them.

"If I were personally tinkering with the statute laws, I would add to rather than subtract from them for the reason that the court decisions have, during the past two decades, rendered uncertain many points which were tolerably certain before the opinions were rendered.

"It is hard to suggest a plan which would remedy the situation. The only one I can think of is to elect more lawyers to the legislature, and especially more experienced and seasoned lawyers; but the people, by their votes, and by their public expressions, are continually and emphatically showing preference for laymen instead of lawyers in the legislature."

Charles W. German, former president of the Missouri State Bar Association, offers a remedy which, on its face, appears practical if it could be applied. Obviously, considerable coöperation among lawyers would be necessary.

"I have often thought," he writes, "and, in fact, I have frequently put into practice, that if the lawyers of the state, during the interim between sessions of the legislature, would make note of such laws with which they come in immediate contact in the course of their practice which either need revision, or which are unnecessary, to say nothing of those which appear vicious, and if before (Concluded on page 22)

What About Your Budget?

Do You Live on Your Income "As Is" or as You Imagine It?

By MARY WILLIS SHUEY

NOW a family budget isn't a cure-all, good in a financial way for whatever-ails-you. There are some fortunate families where a budget is not even necessary. Yours may be one of them.

Your income is always enough to cover all your bills, each member of the family is perfectly satisfied as to personal wants, and you have sufficient amusements and trips. You give as you feel you should to church and charity appeals, and you have a growing savings account to give you a sense of well-being and satisfaction. If your home is like this, or if you are completely satisfied with things-as-they-are, you do not need a budget.

But in many families there is a charged atmosphere twelve times a year, when the first of the month brings the bills. There are discussions, to say the least, as to where the money goes. No one has been intentionally extravagant, yet in some unaccountable way more money has been spent than anyone intended. There is such a little bit to show for it all, and there were other things you really wanted, too. In fact, there is usually some member of the family who feels a trifle slighted in the deal! Along about the third of the month the man-of-the-family registers in his own mind "the other fellow" in a correspondence school ad. "Why aren't we saving like the Smith family?"

Such a family needs a budget at once.

Really, it is the well-known Smith family who cause a lot of our money troubles! Of course, we all say that we aren't governed by what other people do and think. We haven't a "Follow-the-leader" fixation! But even if we never do out-and-out covet anything that is our neighbor's, we are bound to see what he has. More especially what *SHE* has!

A budget focuses our attention on *OUR OWN* financial problems. It gives us a definite money code by which to live. While it may not work miracles, it will certainly produce results.

We do not bank on futures, nor cling to the past.

We live in the present, "as is, where is, how is." Once we have done that, we are no more concerned about new dining-room furniture next door than we are about the same furniture in the store. Oh, of course, we still have some of those bed-time chats as to "How in the world do they do it?" but there is nothing personal in it! We know what *WE* can do ourselves, and that is what counts.

And every little while we learn how it was that some of those people managed to have more than seemed plausible on their incomes. We hear of bills that mounted, and sometimes it is a real tragedy that brings it to light. "Financial difficulties" are not altogether a matter of business: they are a matter of *HOME*.

We all want our dollars to buy as much as possible, and a budget will find the longest distance between two dollars. A dollar will stretch a certain distance, but we have to know the breaking point.

Budgets are things that can't be bought ready-made. Our financial measurements and our tastes vary too much. No two families want exactly the same things, so each budget must be made to fit the individual case. But with a budget we gain a sense of proportion. We can be consistent without being standard, you know! Too many idiosyncrasies in expenditures are apt to be ridiculous. By adopting a budget you plan your expenses to scale, and the result is harmony of living.

We see silk husbands and calico wives, and the other way round. Overstuffed furniture—and empty refrigerators. Eighty-five dollar dinner gowns—and mercerized tablecloths. Those are the people who do not budget!

The home is our greatest American industry. Sums estimated at around seventy billion dollars are spent annually for its upkeep and support. If any other business did its buying and spending so casually it would be bankrupt.

The home isn't bankrupt, but they tell us that nine out of e ery ten family spats have money as their cause. It really is time that we were working for "Home, Solvent Home." Read these questions, which a New York judge asks in divorce cases that come before him:

"Did you ever study home economics?

"Do you know how to handle a family budget?

"Did you establish from the beginning of your married life a financial arrangement for paying bills?

"Have you been careless about charge accounts?

"Do you know how to cook?

"Have you set a standard and routine for your family, and tried to make your husband live up to it?"

He says that in cases coming before his court he recalls only a few isolated cases where home expenditures were well-managed.

The marriage bond is not a financial bond, but it takes something a little more definite than "With all my worldly goods I thee endow" to meet the bills promptly and to keep things running smoothly!

The beauty of a budget is that once it is worked out and passed by the family council it does away with family discussions of money. It takes the united efforts of the family to figure out one that will fit its needs, and it lets every member of the family "in" on the money situation. When we know just where we stand it is easy to help all we can! The day of the Total-Blank Wife passed some time ago, but there are still men whose sole idea of saving is a hold-out. Marriage is a fifty-fifty, partnership affair if it is to be a permanent thing.

There are persons who say that a budget is too much trouble. I've never been able to see why a woman who can add bridge scores easily finds it difficult to check a food bill! Even at its worst an end-of-the-month check of your budget takes no longer than a cross-word

(Concluded on page 26)

What Makes Humor Humorous?

By THOMAS L. MASSON

Tom Masson was born in Essex, Connecticut, and in his younger days made voyages to far-off countries with his father, who was a sea-captain. He had thus an opportunity of studying the jokes of all nations, and this no doubt laid the foundation of his success as a humorist.

It is said that each nation laughs in its own language; Tom Masson has succeeded in making all nations laugh in his.

He was literary and managing editor of *Life*, New York, for thirty years, and is the author of numerous stories and articles about jokes ancient and modern. His output of jokes up to date is estimated at about 60,000, and he has been known to write as many as 100 jokes in one day, a fact which surely gives him a claim to the title of the world's champion long-distance humorist.

IT IS rather surprising to think that in a country as large as ours, with its thousands of newspapers and periodicals, not to mention books, there are not more than a hundred active humorous writers, and less than thirty who have any permanent reputation.

Out of every three hundred manuscripts received from all parts of the country (with a sprinkling from foreign cities) and written by amateurs and by those who have attained some local reputation, less than five on the average find their way into print.

Instead of being a popular pastime, the writing of genuine humor is a very rare accomplishment. It has been so recognized in all ages. Humor depends upon surprise, and as soon as it becomes common, its quality evaporates. The great humorists, therefore, have succeeded only in becoming permanent because of their power to create characters, and characters are based almost wholly on dialog. Allied with these are the ones who have been able to exploit their own personalities. And in addition, there is that larger company, numbering among them perhaps the greatest artists but who, lacking this power to create characters, fall back on a skill at satire, an acute penetration, and use either the essay form, or else seize upon any other kind of form through which they can express themselves.

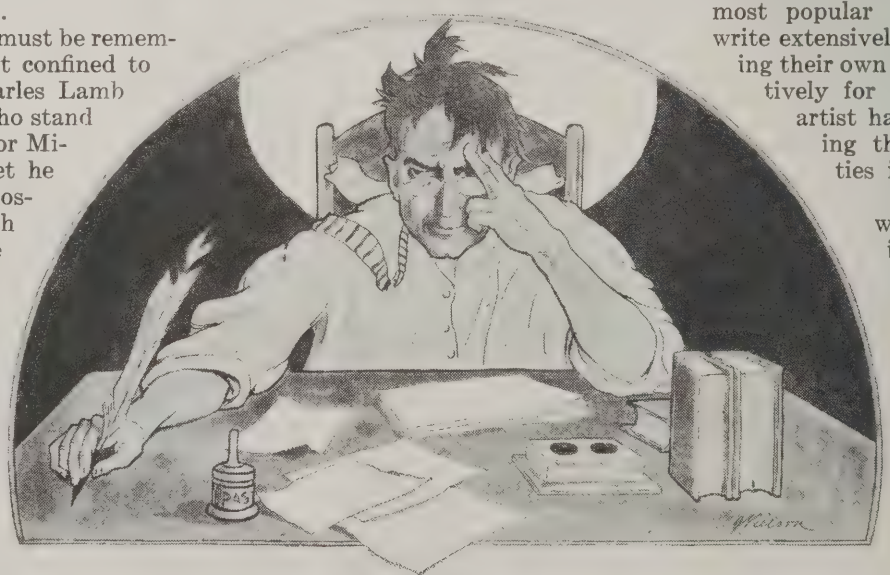
Burlesque, of course, is a common medium. The so-called "take off" is probably the easiest and simplest way of making people laugh.

At the same time, it must be remembered that genius is not confined to any special form. Charles Lamb created no characters who stand out like Dick Swiveller or Micawber or Pickwick, yet he has created certain atmospheres, lighted up with immortal flashes of true humor. And this could have been done in no other way. Kenneth Grahame in his "Golden Age" has created what may be termed a group character, consisting of a number of children, who exhale the finest kind of humor. Yet none of them stands out as an individual creation. Jane Austen's characters are quieter and far less boisterous than those of Dickens', yet their permanence must be conceded.

The fact is, that if we take the word Humor as a blanket word, we shall find that, broadly speaking, it covers a number of other words, each of which stands for a certain kind or quality of Humor in general. These are Comedy, Satire, Burlesque, Parody, Farce, and Wit.

Many writers have attempted to analyze these forms. Cicero tried it in his book on Oratory. Schopenhauer, in his Essays, attempted it. In England George Meredith's essay on Comedy is almost a classic. In this country Max Eastman's "Sense of Humor" is probably the best book. But while these so-called kinds of humor are evident to those who have studied the literature of the subject, there is practically no other way in which their distinctions can be made plain except by examples.

In this country the humorous characters created can almost be counted on the fingers of one hand. They seem to be no other than Washington Irving's Rip Van Winkle, Sam Slick's Clockmaker (and he was a Canadian) Mark Twain's Tom Sawyer, and more recently, Montague Glass's Potash and Perlmutter, Peter Dunne's Mr. Dooley and at present Harry Leon Wilson's Ma Pettingill and Merton, Don Marquis's Old Soak and Wallace Irwin's Togo.



The birth of a joke.

Mr. Wilson's Merton of the Movies is the character effect of certain machinery upon human conduct. His Ma Pettingill is more firmly rooted in the soil, and significant as being a woman. Of course, there have been other woman humorous characters—Samantha at the Centennial is one—but in this country they do not appear to flourish. Apparently we do not relish the idea of making our women comic. We worship them too sincerely.

As for Don Marquis, it is possible that his Archie the Cockroach is a better rounded character than his Old Soak, but he is undoubtedly laboring under the disadvantage of a deterrent anatomy. Mr. Dunne's Dooley is more universal, although in common with Togo, he is racial.

Many of our humorists, whose genius in creation has not found its expression in definite characters, have been thereby forced to fall back upon themselves. There can be no objection to this, if one succeeds. Artemus Ward delighted Lincoln, and took London by storm with his account of his Wax Works, his own personality being thinly disguised for the purpose. Bill Nye used himself as a comic character, employing an artist to "feature" him in the newspapers in which his traveling letters appeared. Irvin Cobb now follows this precedent.

But here our pictorial personalities appear to end. Stephen Leacock of Canada, and Ring Lardner, Sam Hellman and Will Rogers, perhaps our own most popular present-day humorists, write extensively about themselves, using their own personalities most effectively for their purposes, but no artist has succeeded in projecting their material personalities into the popular mind. Of course Will Rogers, who does such good work in holding us up to the view of our own national weaknesses, started out in his writing career with a large advantage, for he had made himself known through the stage beforehand. His personality, aided by the twin properties of chewing gum and his lariat, had already become fixed in the minds of a large audience. When he discovered that he could write, he was able to transfer this personality to the printed page with comparatively small effort. He is without doubt a true comedian.

So far, however, as the use of one's own personality is concerned, we must remember that all humorists inevitably

use this method, in varying degrees. But in the more purely intellectual, and —in my own opinion—in the finer expression of art—the material personality is so far in the background as to produce no effect at all upon the reader, the real effect produced being much more subtle and atmospheric. For instance, in the work of two of our most distinguished satirists, namely, Samuel Crothers and Agnes Repplier, we are not at all concerned with their material personalities, because the personalities which so subtly pervade their vocabularies are so much more real to us than those of Mr. Rogers or Mr. Lardner—without, I hope, meaning any disrespect to these two other distinguished purveyors of a more popular humor.

And so it is with Oliver Herford, undoubtedly our finest wit, whose personality, to those who know him, is not to be condemned on any ground whatever, who is privileged materially, so to speak, to do anything he pleases, and yet whose productions have no material properties other than revealed by the spirit. In short, just as Will Rogers is a true comedian in material things, things of the moment, Oliver Herford is a true comedian in the immaterial. Comedy of this sort is so rare as to be extremely difficult of any practical analysis. We may lament our own lack of it in this country, while at the same time consoling ourselves with the reflection that it is rare in all countries and seems to require a kind of racial mellowness to produce it. It has no story element. It stands or falls upon its own word values.

Mark Twain's merit consists largely in the fact that he had both elements. He not only created characters, but he kept his vocabulary alive with surprises; he was personal or impersonal, extremely vulgar or quite delicately human, as the case might be.

So far as the making of our present-day humorists is concerned, that is an affair the inside working of which is composed of some joy but perhaps more sorrow. I have seen one of our most popular humorists writhing in agony for two months, wholly unable to write anything that was remotely funny, only, within a few days, to burst forth into pages of pure comedy. In this respect, there appears to be no difference between men and women. The writing either of humor in general, or of satire or burlesque in particular, seems to require a special kind of mood, and just as the humor itself, to be good, must be *different*, so one's mood must be rare. If this so-called rarity is extended, the humor becomes common, and this is fatal. Therefore, the practical advantage of a material personality will be seen, because, once this personality is fixed in the mind of the public, it is lifted up into that of a character, and much will be forgiven. In this aspect, it is easy to see how almost any remark of Will Rogers may be considered funny. Yet this quality of simply being funny, of creating a laugh, may be the least of those qualities which make up true humor or true comedy. No one, after the lapse of so many years, can read Shakespeare's humorous passages without realizing that it is a very much higher form of enjoyment to feel certain things than it is to laugh at them.

A trio of humorists studying their own personalities.

Most people seem to think that the writing of humor is the easiest thing in the world, and that is probably why so many of them try it and fail. The great majority of manuscripts received from would-be humorists are weak imitations of something they have read. A fair proportion show great cleverness, but are careless and defective in form. The very few who succeed, seem to do so almost by accident, or unconsciously. And, indeed, this is largely true of those who have "arrived." Many of them have shown me manuscripts only under compulsion, in despair over their hopeless weakness, to discover later that these things were their best work.

The difference between current American and British humor is not so great as is supposed. A number of American humorists contribute to *Punch*, although their names are not known. The work of British humorists has a growing vogue in this country. The work of Robert Benchley, one of our most facile humorists of *Life*, is not unlike that of A. P. Herbert, one of *Punch's* most prominent contributors. Mr. Herbert, in his effort at characterization, has adopted a method which is also being employed by others. He employs his own personality as a kind of foil to the personality of one called "George." Between the two, they manage to produce a variety of comic situations.

Perhaps a dozen other forms, used as mediums for the expression of humor, could be named. George Ade was able to Americanize the fable, which had been in use for thousands of years. He produced a gallery of characters, and originated what may be termed a pioneer form of slang, acquiring a properly distinguished reputation. Yet he produced no one character that stands out from the rest.

Slang, as a comic prop to humorists, has always been used, for nothing is so difficult as dialog, and the use of slang may be termed "an ever-present help in time of trouble," for its picturesque qualities, in the retelling, have the same effect upon the mind as stage properties in a theater may have on the eye. In vaudeville, the monologist arrays himself in some outlandish costume to get the attention and laughter of his audience. So the humorist arrays himself in slang. This is a fine art in itself. Imitators are quickly discerned. Both George Ade and Ring Lardner have had imitators, but their reigns have been short.

The fact is that one may employ any medium, can do anything, if he does it in the right way. Shakespeare proved this by his plagiarism of plots. The final test is that of one's own personality.

Both Franklin P. Adams and Heywood Broun have really been of great service in the use they have made of their personalities. While occasionally they have both erred in matters of taste, these errors are slight compared with the general effect of their example. Mr. Broun has used himself, with fine humor, to expose a great many shams which could hardly be exposed so practically and so delightfully in any other way. And F. P. A. has performed an equally valuable work in his insistence on literary standards.

During the last four or five years the number of our humorists has not appreciably increased, (*Concluded on page 31*)

Square Deal for Other Nations

Recognition of the Rights of the Weak an American Principle; American Pamphleteer Encounters Canadian Hydro Champion

By McKEE BARCLAY

THE settlement of the Isle of Pines controversy after a quarter of a century of dilly-dallying has been accepted by our Latin-American neighbors as another evidence that Uncle Sam has no sinister designs on the countries to the south of him. It has been followed by friendly comment from the South American papers who see in it great significance as an indication of a settled purpose to deal fairly with smaller nations. *La Nacion*, the influential Buenos Aires journal, says that the surrender of the Isle of Pines to Cuba "definitely and effectively means recognition of the rights of the weak." It says further: "Confidence in our great sister republic therefore is well merited and constitutes a foundation for continental security . . . We knew the great nation was acting in good faith its rôle of champion of liberty and justice. As in the tragic hours of the war we are able to affirm with renewed satisfaction. Here is the proof."

On the other hand, apparently through no fault of our own, we seem, as a result of President Coolidge's decision in the Tacna-Arica dispute, to have stirred up the enmity of Peru's chauvinists. The Peruvians, with a deplorable exhibition of a lack of sportsmanship, tore down the American coat of arms from the doorway of our embassy at Lima and indulged in anti-American demonstrations of various sorts.

Our treatment of Cuba in the Isle of Pines matter adds to the cumulative effect of a long and creditable list of generous acts toward less powerful nations and coming so soon after that other long-delayed act of justice, the award of $25,000,000 to Colombia for the absorption of Panama, and our patient dealing with troublesome Mexico, it seems to promise stronger Pan-American bonds of friendship. Our liberal treatment of Spain after vanquishing her in war, the payment to China of the Boxer indemnity and our seldom-mentioned award to Japan in the days of her weakness, have all contributed to our prestige as a square-dealing nation. In this world of international jealousies a reputation for national honesty is a valuable asset.

Senator Borah, Chairman of the Foreign Relations Committee, has announced that nineteen treaties with foreign countries were ratified during the short session of Congress by the Senate. The committee calendar was cleared, except for the Lausanne Treaty, which went over until the December session.

On account of disturbed conditions in China six new gunboats of light draft and high power are to be built and sent to Chinese rivers. Because of the immediate need of their services they will be built on the other side of the Pacific, thus avoiding the lost time necessary for the long trip to Asia.

The *Congressional Record* of the last day of the Senate session carried twenty-eight pages which were devoted to a ventilation of the alleged prostitution of the Smithsonian Institution's machinery for private power monopoly propaganda. Coming at a time when the echoes of the Muscle Shoals controversy have not died down and when Herbert Hoover's super-power proposition is attracting so much discussion and comment, the matter has precipitated quite a pretty little row.

It seems that, according to the *Congressional Record* report, Samuel S. Wyer, a consulting engineer, with offices in Columbus, Ohio, is also carried on the rolls of the Smithsonian Institution as "Associate in Mineral Technology." Mr. Wyer is said to draw retainers from private "corporations and gas companies and figured as a rate expert in many cases for such companies and before various commissions." This understood, it will be plain that his position is strategically advantageous, should he desire to issue propaganda for his clients under the authority and with the indorsement of the Smithsonian Institution, a government institution—for this is what he has been charged with doing. In the matter placed in the *Congressional Record* these acts are imputed to Mr. Wyer: He wrote and hurried to publication a booklet which purported to show that the Hydro-Electric Commission of Ontario had made a sad mess of its attempt to demonstrate that a publicly owned power system could be a success. Because the Smithsonian Institution's facilities for quick publication were not equal to the emergency, Wyer hurried his treatise to a Baltimore printer, advanced funds for its printing and was able to distribute copies by January 15 of this year. Mr. True, editor of the Smithsonian Institution, is quoted as saying that though the institution always secured estimates for printing this "was a rush job and they did not have time for estimates." It is interesting, and probably significant, that the period January 5-15 marked the crisis in the Muscle Shoals debate in the Senate. Hence, one of Senator Norris' chief reasons for reading the matter into the *Record*. More than 170,000 copies of the booklet were sent out in one month.

Sir Adam Beck, head of the Ontario Power Commission, published a hot rejoinder to Wyer's allegations in which such words as "absolutely false," "gross errors," and "contrary to Mr. Wyer's assertion" occur frequently. While Sir Adam's expressed indignation that a government agency of our country should have been put to a perverted use in an attack on an institution of his country, a friendly neighbor, received a sympathetic hearing, the real milk in the cocoanut, from the viewpoint of American Senators, consisted in the mere fact that official backing was being given to private propaganda of any sort.

One of the statements quoted in the *Record* charged Wyer with being an old offender and gave these counts against him:

1. In 1918, while temporarily employed by the United States Bureau of Standards, he wrote a pamphlet, "Natural Gas, Its Production, Service and Conservation." Wyer's superiors in the bureau, Doctors Stratton and Rosa, efused to publish what Wyer had prepared, on the ground, it is understood, that it contained propaganda in favor of curtailing production and increasing the price of natural gas.

Over the earnest protest of Doctor Stratton. Dr. Charles D. Walcott, *(Concluded on page 15)*

The business propagandist's new manikin.

EDITORIAL

THOSE persons who ascribe the number of traffic accidents to the increase in the number of motor vehicles are simply betraying the great American habit of attempting to reason without the facts. An agency that has investigated hundreds of cases says that booze is a controlling factor in nearly every traffic accident other than those where children or aged persons are involved. Sometimes it is the driver and sometimes it is the pedestrian who is affected, but liquor is the greatest cause. The automobile is essentially a "dry" affair, and though the country should go "wet" again, the automobile would force it to return to its dry status.

Booze and the Motor Car

Scientific tests prove that moderate trial doses of so-called good liquor decrease both the speed and the accuracy of eye and hand movements and coordination and also increase *body sway* about seventy-five per cent. The patellar reflex, a standard gauge of nervous and muscular coordination, shows a negative variation of between twenty-five and fifty per cent. Moonshine and wood alcohol liquors and etherized beer, of course, make the above distortions of mind and body functions seem too mild for consideration. The bootleg consumer's ability to make his wits and eyes and arms and legs connect is almost negligible at times.

Prohibition is not a social experiment that society can either retain or toss aside; it is the only means whereby man can utilize the machinery that permits him to conquer the land and the sea and the air and survive. Progress itself is prohibitive of alcohol as a beverage.

THERE are a number of immigrants arriving in this country for whom Ellis Island holds no terrors, and over whom immigration officials have no power. These immigrants are the "Old Masters." The complaint rises in England that many of the private collections of that country are being depleted of their richest treasures to embellish the art galleries of the United States. Laws are being suggested by which the British Government shall have first choice of these precious works, although it is everywhere admitted that even the British Government would be likely to come off second best in a bidding contest with American millionaires.

Is It a Renaissance?

France and Italy have laws which forbid exporting works of art that are regarded as of national importance. The result is that the paintings imported to the United States are largely British; the finest works of Reynolds, Romney, Gainsborough, and others of the English school have found a permanent place in America. Although, through English channels largely, almost every other school of painting is to be found in this country, the works of Rubens, Van Dyck, Rembrandt, Velasquez, the Italian masters also being well represented in various collections.

The burden of taxation has hit the English nobility and gentry so severely that they are unable to support their estates, and one of the readiest methods of "raising the wind" is undoubtedly parting with some of the gems in their art collections. We are not a sordid people. There is an art in our very industry. It may one day become a veritable fine art. It is, as it stands, the creation of the artistic spirit, more imbued with human helpfulness perhaps, than any art which has preceded it. The glory of the artists whose work we are importing is that they saw significance in the prosaic life about them. As artists we shall see as deep a meaning in the less prosaic life of our times.

IT IS not often that the *Scientific American* lets itself in for criticism so obviously as in its study of Muscle Shoals, in the May number. No propagandist of the power trust has ever quite so baldly ignored the whole reason for Muscle Shoals' existence, nor so ruthlessly thrust aside the possibilities of its present usefulness. The great development at the Shoals was undertaken for the manufacture of nitrates. No other purpose was in view. Power was unnecessary except for the production of nitrates. The entire physical structure can be explained in only one word—nitrates. Yet the staff man of the *Scientific American* coolly concludes that nitrate is about the one impossible thing at Muscle Shoals. Power is the thing, he says. Yet power has never had any meaning at Muscle Shoals, until politics came in, save in the manufacture of nitrates.

Muscle Shoals for Exporter or Citizen

The United States erected the great dams and plants on the Tennessee River as a war measure for the production of nitrates. It built in the heart of the country, far from danger of alien attack, a great source of the munitions of defense. An internal source of supply was sought for the elements that go to make explosives. Nitrates for explosives—was the sole reason for the origin of Muscle Shoals.

With the war over, what good was a nitrate plant? men asked. The answer was, What makes explosives in time of war, makes also fertilizer in time of peace. Common sense and patriotism agreed in recommending the preservation of this great defensive work by maintaining it in useful operation for the purposes of peace. Let it make fertilizer for the farmer whose tax to the fertilizer trust is one of the most enormous robberies practiced in this country. Let it relieve the farmer, employ the South, and be kept ready against the time when the nation's defense may again need it. That was the plan of common sense.

But, in common with the politicians and exploiters, the *Scientific American* forgets the farmer and forgets the national defense. Turn it over to the

power trust; there will be a howl, but what of it! It will never be any good for producing the only thing it was built to produce!

There is nothing against power, or the production of power, when power is produced to be used. The interests which are favored by the *Scientific American's* article do not produce power to *use*, but to *sell*. Power, like fertilizer, can be produced and served to the public at half the present charges. Perhaps that is why bids that threaten the two monopolies are not welcome, while suggestions that the power trust get the Shoals are quite favorably considered.

So here are two potent reasons for Muscle Shoals being jockied about as it is:

First: In competent, honest hands for the production of fertilizer, it will be the downfall of the Fertilizer Trust.

Second: In competent, honest hands for the production and sale of power, it will be the downfall of the Power Trust.

If the *Scientific American* will make a scientific study first of fertilizer and then of power, and after that come back to Muscle Shoals, it will know what it should have known before publishing the article in question.

The Ford offer for Muscle Shoals was soundly based in engineering, finance, and economics. Its purpose was the public service. It is well within the truth to say that it has set up principles from which it will be difficult, if not impossible, to depart.

The First President of Germany

GERMANY has not changed: the election of Von Hindenburg would seem conclusively to indicate that. But the fact need not be blameworthy; more blame attaches to the illogical expectation that Germany should change. A nation does not drop its character overnight. After an experience such as no nation has ever endured, a fantastic nightmare of every kind of extravagant extreme, Germany was at last given her own voice, and that voice pronounced for the old Germany of blood and iron.

There has, of course, ensued the usual chorus of criticism and regret. Yet believers in democracy as the heal-all of the world must see that this is democracy to the full—all Germany over 20 years of age choosing the old war horse. To interpret it as the revival of the military spirit may not be entirely correct. It may be only the sign of disgust with politics and the desire for a strong hand at the helm. Von Hindenburg doubtless fits the mind and temper of the German better than an Eberts could. The German desires a strong man to direct him, to take affairs in hand and rule. Under whatever form of government, the German prefers the method of kaiserism. Von Hindenburg will supply this; though his title may be President, his office will be czar.

The election is a warning to the alien looters of Germany that Germans are again in control. Whatever else may be said of the old general, he is a German patriot. He feels a protective duty toward the German people. He will not softly suffer their continued robbery by un-German international finance. At the same time he has a broader view of Germany's relation to the outer world than some recent German statesmen have had. Less trickery and more direct dealing may be expected from him.

The American attitude, until good reason occurs to change it, should be this: Germany has chosen its first popularly elected President; we wish him and the country a prosperous administration.

English the Rage in Russia

APROPOS of recent articles in this paper on the rapid pace at which English is becoming the world language, a recent visitor from Russia says that a comfortable living can be made in that country by any teacher of English. Soviet leaders who could not use English were among the earliest and most eager students, and though doubtless their motives were political, their compliment to English, whether as the language of revolution or construction, should not be minimized.

But it was to the peasantry that our visitor referred. The people of Russia are feeling the breath of national revival. Something like a new youth is coming to the folk on the land. And so much that they want to know is known to English-speaking people, and stored up in English-printed books, that they crave knowledge of the tongue as a key to the knowledge. In one agricultural community a book on bees was common property—an American book. But only the illustrations were intelligible to the people, though by the illustrations they learned a great deal about bee-keeping. One of the young men mastered English, read the book, scattered its knowledge throughout the community and became quite a hero as a two-tongue man.

With all due respect to the strength, beauty and usefulness of other languages, it seems quite plausible, as our recent contributor put it, that the World Language does not need to be invented; it is already here in English.

The Result of Political Law Mongering

THE government, or that part of it which was involved in the prosecution of Senator Wheeler, comes off rather badly. The impression is now ineradicable that the action taken against him was a species of political persecution, first to punish him for his zeal in tearing the mask off the Teapot Dome Corruption, and next for opposing the regular parties as Lafollette's running mate. It is an impression that will have a degree of political consequence in the future. Unfortunately the figure which government activities have cut in the whole oil procedure has smacked of gross stupidity, so that today the net result of all the work that has been done is nothing. It is not good for a country to be given to feel that its government is a piddling group of incompetents. It is injurious to national morale to feel that the crooks are brighter than government representatives. Washington's prestige depends on Washington's power by superior ability to command results, and this ability has been conspicuously wanting for some time now.

Mr Ford's Page

HUMAN nature in its present phase is marked by a tendency to weariness when any challenge to its indifference is constantly repeated. The alarm clock is never popular. Strenuous ideals wear down at times their power to compel admiration. State a truth too often and it becomes a platitude and at last a plague to patience. Action and rest, speech and silence—the mind demands these variations and pauses for rest.

The bridling of the periodic spirit of impatience may be noted in the occasional outbursts against the use of the word "efficiency." Its inefficient repetition, and its application to all sorts of stupid methods, has come near to making it one of the most hated words in the language. It might prove a balm to some minds if they knew that the men who might best be described by that term, never use it. With them it is a bromide.

Of course the resentment against efficiency as a fact or an ideal is itself one of the most striking instances of natural inefficiency. Seldom has petulance a point, and least of all here. Yet once in a while a point is made, as when a man like Mr. Chesterton demands that we think of Effect in connection with Efficiency, which is a wise demand. What judgment can be placed on efficiency without considering effect? But then, what effect can be achieved without efficiency?

Being a writer who thinks of life as a kind of perpetual doze in old gardens over a book and an atmosphere of Merrie England all about, Mr. Chesterton naturally thinks of the Effect of Efficiency as being its effect upon the worker, upon the efficient man. He suffers the complaint of his profession in supposing that inefficiency spells happiness to the worker, that the better method is the foe of life. The professionals all seem to have views like that. They regard the better method as a means by which the worker is sacrificed for the employer and the market, as soldiers are sacrificed for their country's safety.

Such views are worse than amateurish, they are full of error. The thing called efficiency cannot function at all without first including the concerns of the worker. He is the first beneficiary of efficiency, just as he has always been the first victim of all inefficiency. The prime element in production is the producer. To think of production as a disregard of the producer is to think of vegetation as a disregard of the sun.

The Effect of Efficiency on the Worker is evident. First, it makes him an abler man. An able man is one who knows, who can coördinate his efforts, who can fit means to ends, who can enter as an intelligence into a program of high intelligence and carry on. Compare a man accustomed to loaf along in a badly organized program, with one accustomed to work under the highest adaptation of means to ends, and there is no question as to the Effect of Efficiency on the man himself.

In his own responsibilities as family man, he is the beneficiary of his own efficiency. He discharges his duties to his dependents more fully than an inefficient man can. His wife and children show in their standard of life and in their opportunities, the Effect. Industry and efficiency may be judged by the products which they put into the markets ahead of them, and they may be judged by what they put into the homes behind them. The Effect is mirrored in the homes. It is possible anywhere even now to compare side by side the homes of men allied with efficiency and those of men allied with the opposite.

As a servant of society at large, in his special sphere of service, the efficient man produces an Effect of which all the cavilers at efficiency are the beneficiaries. The growing ease of life, the wider range of its variety, the immense rescue of time from drudgery and its restoration to individual freedom, all these are social benefits, the value of which is inestimable, and they are beyond argument the immediate fruits of efficiency as applied to the daily efforts of men.

What the little coterie of reformers is trying to say is that efficiency grinds men down in the great sausage mill of social benefit, and though the "public" may go riding gaily by, the "worker" perishes. It might be well sometimes to scrutinize the gay "public" if only for the surprise of beholding there the "worker" who is supposed to be out somewhere on the underside of gloom, giving his life for all. No, he is a participant not only in the special benefits which efficiency brings to the worker in the form of shorter hours, larger wages, better conditions and wider privileges; he is also the sharer in the general social benefits which his labor produces.

So much for Effect. The effect of efficiency is a better life all round, a life with wider horizons than ever dawned upon this earth before. People were never so free to move about the face of the planet and never in the story of the race were so many moving. Freedom of physical movement is one of the essential conditions of all freedom, and it has come—as one of the Effects of Efficiency.

TO RESENT inefficiency is a mark of inefficiency. The word is much disliked, but the thing itself works. Efficiency includes Effect, and unless the effect is good all round, efficiency is not effective. The real thing can be judged only by its whole effect. To be efficient for the sake of profits and not also of wages is to be inefficient. The test is that the trinity of trade—manager, maker, buyer—all, in real degree, actually benefit by what we call efficiency, the better method and the better material. It is a fair challenge that efficiency be judged by its effects, and by that challenge it stands.

In Ye Days of Ye Horne-Boke

By L. C. KARPINSKI

THE earliest instrument of torture devised for bringing the child up in the way it should go was doubtless the paddle. Concerning this instrument no history has been written and the earlier models are lost. There is a strong suspicion that their disappearance may be traced to the youngsters for whom these instruments were devised. However, no illustration can be given and practically none but fairly modern switches, a rather vulgar expedient, are to be found in museums.

A second instrument of torture early devised for the instruction of the youth of the land was the hornbook, used to teach children their letters. Somewhat like the Holy Roman Empire which was neither Holy nor Roman nor an Empire, the hornbook is neither of horn nor a book. The hornbook consists of a single sheet, commonly printed only on one side, which is fastened to a piece of board which has a handle as a holder.

Upon the printed page is placed first the alphabet, secondly some combinations of letters like *b a ba,* and thirdly some scriptural or religious selections. The Lord's Prayer and the Creed were the most common selections on English hornbooks. The numerals 1, 2, 3, 4, 5, 6, 7, 8, 9, 0 are also frequently found. The face of this printed page was protected by a transparent sheet, in the early days of horn, and later of isinglass, to protect the page from the smudgy fingers of the youthful student. This type with protection cover of horn has been found only in England and America, although single sheets mounted in this way on a handled piece of wood appear also on the continent of Europe.

The earliest literary reference to the word is in Shakespeare's "Love's Labour Lost" wherein we read:

"Yes, yes, he teaches boyes the Horne-boke: What is A b speld backward with the horn on his head?"

The word came into use about this time (1588) and soon applied not only to mounted a-b-c cards without horn but even to any primer. The word "battledore" book was also used because of the resemblance to the bat used in the game "battledore and shuttlecock." Even the hornbook itself may have been used for the more joyful purpose of the game in recess periods.

Hornbooks were produced like the New England Primer, in great quantity; literally millions were produced. These were undoubtedly the first free textbooks, as we read, as early as 1639 in England, of money given "for the buying and providing of horne-bookes and primers to be given to poore children." As late as 1850 these were in use in the dames' schools of England.

The earliest mention in America of this type of book was found by Dr. Worthington C. Ford, of the Massachusetts Historical Society, in a cashbook of Charles Lidgett wherein, under May, 1678, is found the entry, "For 1 horneing book and paper, 8d." In the records of the Old South Church for 1708 appears the entry: "Paid 1f 10s for horns for catechising.

The best collection of hornbooks in America is to be found in the library of Dr. George A. Plimpton, of New York City, who has written two interesting articles on the subject. After a search extending over many years and involving much correspondence, Dr. Plimpton has been able to locate only five original hornbooks with the horn cover and one Mexican which has the Saint Bambino figure above the simple alphabet.

In addition to the text, a cross was frequently printed at the beginning of the letters. This row was termed the "crisscross row." The child was instructed to cross himself before beginning his lesson. Apparently the notion was that the evil spirits were about to keep children from learning. Most teachers would agree that the children frequently act like the devil and that some type of exorcism would be highly desirable, if at all effective.

Do You Buy From Weeping Widows?

How Furniture and Some Other Merchandise "Gips" Operate

By JOHN ROBERTSON

WANTED—A quick buyer for a gorgeous 3 pc. overstuffed living room suite. Cost bereaved family $450, but widow will sacrifice for $100 to close estate. Leaving city. Hurry. No. 231 Resplendent Apartments.

OCCASIONALLY an apparently innocent classified advertisement resembling the one quoted above will appear in the most reputable newspaper, although the advertisement really masks the operations of a commercial pest termed a "gip." Although named after the "gipsies" because of their wandering, thieving proclivities, the merchandising "gip" is of every racial element that inhabits this land of opportunity.

In spite of the vigilance of newspapers, the police and business associations, this class of tricksters is so wily and resourceful that in the main the buying public must rely upon itself for protection. Spending one's own money is, after all, a personal responsibility. About all that can be done for anyone is to describe the operations of gips, and thus enable more people to protect themselves against roguery.

A call at the apartment mentioned in the typical gip advertisement quoted at the head of this article would disclose a mourning-clad "widow" apparently bowed by sorrow due to the death of her husband, and in dire need of money. However, if the caller purchased the suite of furniture at the "sacrifice" price it would undoubtedly prove to be actually worth less than what was paid for it. The "widow," meanwhile, will probably have moved to another residential district, advertised again, sigh that "her loss is another's gain" and get another good price for mediocre furniture.

Furniture gips are the backbone of the whole gip game. An investigation of the Chicago situation has disclosed more than seven hundred professionals in this particular field. The small towns are worked as industriously as the bigger cities. Ohio is the happy hunting ground of the gips because in that state a good-sized town or city is found about every 25 miles. The volume of the gip furniture business has become so great that it is just as much systematized as legitimate commerce.

How Some Job Lots Are Secured

So-called furniture auction houses are the sources of supply. They plant their offerings in private houses and apartments, and place newspaper advertisements to inveigle people into calling. These auction houses sell some discontinued manufacturers' lines of furniture; bankrupt stocks; job lots; and sometimes merchandise from crooked retailers that desire quickly to convert some of their stocks into cash before going "bankrupt." Some installment houses, that have taken back furniture because of purchasers' failure to pay, have been known to avail themselves of these auction houses, and thereby the gips, to realize some money on bad sales. However, retailers are coming to realize the error of even indirect relations with gips. Some furniture auction houses are said to consign furniture to their own squads of gips and thereby avoid the fluctuating prices of auction sales to those gips who buy outright.

A Woman With a Baby

However, there are some especially alert and selfish gips who operate their own furniture "factories" where they reupholster and refinish old furniture. They sometimes build new furniture, principally the overstuffed variety, out of old packing cases, springs that have been rejected by manufacturers and kindred material. These fabrications are then covered with a fine grade of tapestry or velours and look very convincing when installed in a fake private residence.

Manufacturers of cheap talking machines, radios, tawdry parlor lamps, and other novelties often sell direct to gips. Fences, who purchase stolen merchandise from store thieves, frequently utilize gips as outlets.

The actual selling agents who pose as residents of houses and apartments are frequently women. They have fertile brains and are clever actors. The trusting housewives or married couples, or young persons about to be married, who call to inspect the advertised bargains are seldom matches for the tricksters that they meet in the guise of distressed widows or wives of men about to remove from the city.

Sometimes the callers at an apartment where a gip has advertised furniture for sale will find a woman with a baby (hired from its real mother) in the midst of a collection of household furniture. Close inspection will reveal many queer things. There are usually more bridge lamps than any family would ever have use for. If the caller does not like the talking machine offered for sale, the pretense often made, for example, that the woman's mother also had a machine and has decided to include it in the sale and it is brought forth. In one house where gips were detected, thirty-four talking machines were found stored in the basement.

In another apartment "shopped" by investigators, a woman and her daughter were in charge. They offered a dining-room suite of big pieces that included eight chairs although it was in a tiny room and there were but three persons in the alleged family. When casually questioned, the gips explained, "Well, we thought that while we were buying it we would get a big enough dining-room suite for holidays and other times when we might have many relatives visiting us." In addition to the ample dining-room outfit, there was also a breakfast room set in the kitchen. Another gip outdid this one by including 11 identical dining-room chairs in a single suite. However, few callers seem to be able to discern such incongruities.

A clever gip employed the device of having all the furniture except that in one room ostentatiously cased up awaiting shipment to the new "home." However, a subsequent visit by an investigator disclosed the fact that the furniture in that particular room had been replaced by another suite. Incidentally, one never sees the entire family at the gip locations. If a woman is not in charge, a sharp young man will be lounging about ready to pounce upon unwary callers.

The Woman Who Offers Furs

"Going to Florida" and "Going to California" are two favorite reasons given in the advertisements of these gips of furniture for sale in their "homes." However, the "widow" or "executor of an estate" ruses are the standbys of the gips that employ classified newspaper advertisements.

Occasionally a gip will effect a clandestine alliance with a clerk in a regular furniture store. The clerk-confederate will discreetly suggest to some shoppers that they can avoid the high prices of downtown stores and obtain bargains by visiting the gip whose card is handed to the callers. Of course, such disloyal clerks are paid commissions by the gip.

Although some owners or agents of houses and apartments are sometimes deceived by gips who lease living quarters for the illicit sale of merchandise, the average transaction includes collusion between landlord and tenant. The rental agent of property owned by non-residents, especially where an apartment house janitor handles such matters, will sometimes permit a gip to occupy a house or an apartment for a limited time without a lease and pocket the rent money,

which is paid in advance. Without exception, investigators have found that the janitors of apartment houses infested by gips have been retained in one way or another since the janitor provides storage for the reserve stock.

Nothing could be more natural and plausible than the offering of furs and other wearing apparel by gips who are engaged in selling furniture from so-called private homes. In other cases, female gips will rent rooms in second-class hotels and boarding houses and advertise wearing apparel, new and second-hand, for sale, frequently posing as actresses.

"Furniture From Factory to You" Fake

In many cities the sale of merchandise from private homes is forbidden unless a sign bearing the word "dealer" is displayed on the premises and included in every classified newspaper advertisement. Whether or not there is such an ordinance, reputable newspapers everywhere coöperate with legitimate business houses, in suppressing gips by declining their advertisements.

The classified advertisements, without the warning word "dealer" are usually placed through a corner drug store agency for the newspaper and paid for in advance. This enables the ad. to be run at least once before anyone in the main office of the paper detects the ruse of the gip. But in any event it requires clever work to prove that the advertiser is really a gip.

Another form of furniture gip is the operator who leases a downtown store building or big residence on the edge of the retail district and plasters the place with gaudy signs announcing: "Furniture From Factory to You"; "Grand Rapids Furniture Co. Store" and other misleading things that suggest that the regular retailer's profit is saved by the customers of these traders.

The associated furniture manufacturers of Grand Rapids are constantly bringing successful legal proceedings against gips throughout the country who purport to operate "Grand Rapids" furniture stores. However, useful as such work is, it does not operate except where the title "Grand Rapids" is illegitimately used, and naturally many fake stores take other names.

A limited amount of rather resourceful giping is done right in Grand Rapids by fakers who work on those persons who refuse to believe that Grand Rapids manufacturers will not sell direct or at retail to consumers, and who come to that city to show themselves able to buy regardless.

It then becomes known in Grand Rapids that certain out-of-town persons are seeking to buy factory furniture at retail. They then begin to receive calls from "hush," "hush," persons who claim to be able to turn the trick. The rest of the story is simply that some junk in a warehouse or loft is unloaded upon the pilgrims who believe that their furniture "bootlegger" friends have got it released from a nationally known factory. Since the National Government cannot drive retail bootleggers out of any good-sized town, it is too much to expect furniture manufacturing centers to be freed from gips.

Another variety of gip is the pseudo-sailor attired in loose blouse, big, flowing pants, cap and all. He calls at private residences and unwinds lace from about his waist under his blouse, at the same time darkly referring to the high duty upon imported lace and his cleverness in evading the customs officers. Of course, our sailor friend is simply a gip who never sailed on anything more maritime than a ferryboat. An unusually enterprising concern has profited hugely through supplying door-to-door gips with serge-like cloth made in this country and labeled "This cloth manufactured on British looms." Credulous people are led to believe that the stuff is made in the English Midlands and smuggled into America, a rare opportunity to get fine woolens cheaply. As a matter of fact, many American textile manufacturers use looms made in England, France, Belgium, and Germany, but it took the agile brain of a gip to conceive of the manner in which this fact could be capitalized.

An amusing but highly profitable gip operation is being conducted in a well-known city by two young men whose ingenuity is sufficient to make them successful in more reputable channels. They are known as the green-wagon fur men. Dressed in rough sailor-like clothes, these two fellows drive about in a small, closed delivery truck, painted green. Parking their car, and store, at the curb, these gips will sidle up to individuals and say in a mysterious manner: "You wouldn't be interested in picking up some furs cheap, even if you didn't know where they came from?" The prospect is hastened to make a decision by such statements as, "Of course we can't come around here again" and "we've got to get rid of this stuff right away." There is much talk of the high duty on furs, smuggling, the frequency with which fur store thieves have to part with their loot at sacrifice prices, and so on.

The Odor Is Quite Convincing

These green-wagon operators are neither selling smuggled furs nor furs stolen from manufacturers or retailers and sold to fences. They are merely disposing, at good round prices, of what are known to the fur trade as "burnt" furs. Such furs have been given too strong applications of the chemicals used in processing pelts before they can be made up into garments. Although the outward appearance of the furs may be changed little or not at all, their life is gone out of them. Incidentally, these young men have provided themselves with every variety of license that any authority can demand of them. They are so smart that they remind one of the immortal Sam Slick, the Yankee clock salesman and prototype of Uncle Sam, who was originated by Judge Haliburton, of Nova Scotia. When Sam met a native Nova Scotia shopkeeper who bewailed the loss of trade to smugglers, Sam pertly advised the troubled man to term his own goods "smuggled," raise the prices, and then let human nature do the rest.

Gip salesmen go to offices and stores and sell women clerks what they claim to be well-known makes of perfume that have been smuggled in, permitting low prices to be named. The odor is quite convincing, but it is simply good perfume that has been "cut" by having distilled water added until the volume is doubled. The essential oils float on top and until the user gets down to the water, it seems like a bargain.

The Demand Creates the Supply

A more spectacular trick of the door-to-door gip is the "nail file" test of so-called silk hosiery. The stoutness of the hosiery is demonstrated to the awed housewife by scratching the length of the stocking with a nail file. The customer believes the sharp point of the nail file is used, but as a matter of fact the gip expertly twists the file so that the broad, rounded edge is stroked along the stocking. It makes a loud, tearing noise that is quite convincing, but it is mere sound and fury signifying nothing except that it enables the gip to get the money.

Why do gips exist and flourish in a land that prides itself upon its legitimate productive and distributive facilities for human necessities and luxuries?

The demand creates the supply. The demand is created by the bewildered and afflicted housewife, who is trying to maintain an appearance in house furnishings and the attire of her family that corresponds with the standards set by illustrated advertisements and shop windows, and at the same time live within the family income. With her, it is a case of any port in a storm. She is willing to believe her hope that there must be bargains in the world if she can but find them and it is that hope and that belief that gives the gip his chance. He offers "bargains." It is really a challenge to our present-day life. The housewife should live in a community that does not demand the impossible. On the other hand, these gips indubitably have merchandising ability, enterprise, and industry above that of the average humdrum shopkeeper or they could not exist and profit—such talent should be honestly and constructively employed. Both such buyers and sellers are the victims of an unsolved economic and social problem.

Square Deal for Other Nations

(*Concluded from page 8*)

Chief Executive of the Smithsonian, accepted the Wyer manuscript and published it under Smithsonian imprint.

2. Early in 1923, Wyer prepared an expensive leather-bound "Study of Pennsylvania National Resources," which also went out as a "Smithsonian study," and was distributed under Government frank. Hundreds of copies were presented to the Pennsylvania State Board of Education for free distribution to schools and libraries.

Gov. Gifford Pinchot stopped the board of education from further distribution when he learned that the book contained propaganda against the State's attempt to get electric current to Pennsylvania farms.

3. In conflict with Wyer's statements that he personally bore the $30,000 cost of compiling the Pennsylvania resources book, a letter from his secretary has been discovered dated January 22, 1923, asserting that—

"The Smithsonian Institution funds would not permit the compilation of this work, and the number of outside funds were merged and enough money was gotten together to compile the first edition. However, no funds were available for another edition. Mr. Wyer is hoping that he can induce some of the Pennsylvania business interests to come forward and make a large enough contribution to the Smithsonian Institution for at least an edition of 25,000 copies, but he cannot hold out any definite promise on this."

As a second edition was actually published in August, 1924, it is assumed that the "Pennsylvania business interests came forward."

This second edition, even after Governor Pinchot's protest to Walcott, went out as a "Smithsonian study." Pinchot had written to Walcott, "I have shown this book or extracts from it to a number of engineers and economists, and they agree with me that it is unfortunate that such material should be placed before the children of our State."

4. In November and December, 1923, Senator Couzens, of Michigan, wrote Doctor Walcott transmitting a protest against two pamphlets published by Wyer for the Smithsonian on the ground that the pamphlets contained incorrect or misleading statements and were in effect propaganda for the power company.

An interesting angle of the affair is disclosed by the published statement of a Washington correspondent who was digging into the details of the case. He affirms that when he asked Curator Mitman, of the Institution's Division of Mineral and Mechanical Technology, how it was known that the newspapers were after the story, Mr. Mitman stated that "Secretary Hoover had called Mr. Walcott (Secretary of the Institution) on Sunday in regardto this pamphlet; and that there was a rumor that Senator Norris was going to break loose on the subject and rip the Smithsonian up the back." The writer goes on to say: "Mr. Mitman did not know how Mr. Hoover got his information. In this connection it may be stated that I interviewed Mr. Clapp, secretary of Mr. Hoover's power commission, on Saturday, and Mr. Clapp directed me to go to Mr. Walcott."

Immediately after the adjournment of the Senate, Vice-President Dawes announced that he was going to take his fight for new Senate rules to the voters of the country. He has spoken before nonpartisan organizations in a number of states and his action is expected to stir up the jealousies that have already begun to show up between the Old Guard leaders of the Senate and the New England bloc, with which Mr. Dawes is aligned. The President's new Kitchen Cabinet has not yet publicly expressed its sympathy with the Vice-President's crusade for cloture but the indications are that its members, Adviser Stearns, Attorney-General Sargent, Senators Gillett, Butler, Moses, Bingham, and Dale, all of New England, will "go along" with their vice-presidential ally. The two Pennsylvania Senators, Pepper and Reed, who have been making a bid for associate membership in the Kitchen Cabinet, are expected to lend encouragement. Mr. Dawes will not be the only disturber of the peace and quiet of the between-sessions season. Senator Borah, who has come to be one of the most powerful—if indeed not the most powerful—figures in the Senate, is going on the warpath. He has his war paint on and is going out for the scalp of the World Court Plan. He is going on the stump to combat the propaganda for what he considers backdoor entrance into the League of Nations.

Director of the Bureau of the Budget Lord has announced that he expects a Federal surplus of $100,000,000 for this fiscal year and a surplus of $373,000,000 for next year. In the Congressional debates $500,000,000 was frequently mentioned as the figure representing the available basis for tax reduction. The session of Congress which ended March 4 made appropriations amounting to almost $4,000,000,000, for 1926, in which was found $1,315,000,000 for interest on and retirement of the public debt. This was about $25,000,000 less than the appropriations for 1925 but more than $22,000,000 of this reduction was for public debt operations. In other words, the economies inaugurated amounted to less than $3,000,000.

Congress, broadly speaking, goes through three major operations in making appropriations. It takes up first the regular annual appropriations for the departments; second, deficiency appropriations and third, public debt operations and minor permanent and indefinite appropriations for the departments. The average man will do well to accept Mr. Lord's statement that this year's surplus will be $100,000,000 and next year's $373,000,000 and let it go at that, as the political manipulation of complex bookkeeping statements sometimes are hopelessly confusing to ordinary business men. There is, for instance, a sort of floating item of $213,000,000 in the statement of our financial condition which may be charged at will to last session or this session of Congress and recorded as a saving in both this and last year.

There seems to be a disposition on the part of the government to recognize the fact that it is poor economy so badly to underpay efficient employes that they are seduced by offers from private business firms and corporations as soon as they have demonstrated their capabilities. This is one of the many considerations which will make the new economy promises of the Administration subject to possible modification. Senator Smoot, who probably is as well posted on government expense statistics as any of our budget experts, says that we have already cut to the bone in our economy movement. His exact words were: "We have gotten down to bedrock and from now on I do not expect to see appropriations for the government become less than they have been for the ensuing fiscal year."

In all events, Mr. Coolidge has performed a great service in dramatizing the countinuing necessity of economy so that government expenditures will be closely scrutinized by the business men of the country. That, after "thinking in terms of billions" for a decade we should be able to congratulate ourselves on having $473,000,000—less than half a billion—as this and next year's so-called "surplus" is an indication of the changing attitude of mind of the American public.

Again there has been an extension of the responsibilities and functions of Super-Secretary Hoover, of the Department of Agriculture, Co-Secretary of the Interior, Sponsor of the Navy Department, and Adviser-General to Departments, Bureaus, and Commissions. On his broad and willing shoulders has now been placed the work of the Patent Office. This important branch of the government, with all its facilities for monopoly creation, which has been under the jurisdiction of the Department of the Interior for 76 years, is now in the Department of Commerce.

The total number of applications for patents, trade-marks, and so on, has increased year by year until they now exceed 100,000 per annum. Those issued now annually exceed 55,000. The printed copies of patents and trade-marks sold annually amount to more than 2,500,000. The bureau is nearly self-supporting, as the income from fees, and so on, amounted last year to $3,042,276.22 and the expenditure to $3,273,341.37.

The transfer was made by executive order and word comes from "sources close to the President" that Mr. Coolidge wants to give control of the Bureau of Mines also to Mr. Hoover. When the act which created the Department of Commerce was passed one of its sections authorized the President to transfer at will from one department to another any bureau having to do with scientific work. Now it turns out that the President, acting in his own discretion, decided that the Patent Office comes under this classification but that he is in doubt about the status of the Bureau of Mines and fears that there are legal bars to its transfer which cannot be lifted until Congress convenes in December. This matter is left open, however, and as the term "scientific" is a pretty broad one the Bureau of Mines may fall in Mr. Hoover's lap, or on his shoulders, before summer wanes into autumn.

The Ireland of the Gael

Scenes From Cottage and Glen Where Culture Was Supreme

By THOMAS CAMERON TAYLOR

Illustrated by Paul Honoré.

The hill road.

In the remote parts of the Green Isle lies your hope of success. You go well equipped for the search if you believe you have traced the Gael in his centuries-long wanderings from somewhere near the foot of the far Himalayas and have defined through mid-Europe to the Western sea the course taken by this people of the restless feet who "chased the daylight Westward" and left, wherever they passed, a wider and brighter trail than they found. The mere challenge of a word has interest, in that connection. "What is your Gaelic for 'the place of the serpents'?" queried a gentle Gael of the Gaels in a quiet sheiling in a lonely glen of Erin. "Narakan," was the reply. "That is near enough for my purpose," he returned, "for I wish to point out that the name of one of the Seven Hindu Hells is 'Naraka,' and it signifies 'the place of the serpents.'"

Not so much in the ruins and records which bear traces of Erin's ancient glory as in the legends and traditions and folklore stored in the minds of the old people in the remote

Folklore stored in the minds of the old people.

THE quest for the Ireland of the Gael leads in these days by ways little-trodden; by the hill-road, the peat-track, the cart-track that loses itself in moss in the quiet glen; ways toilsome sometimes but beautiful always, and ample in themselves in the reward they render.

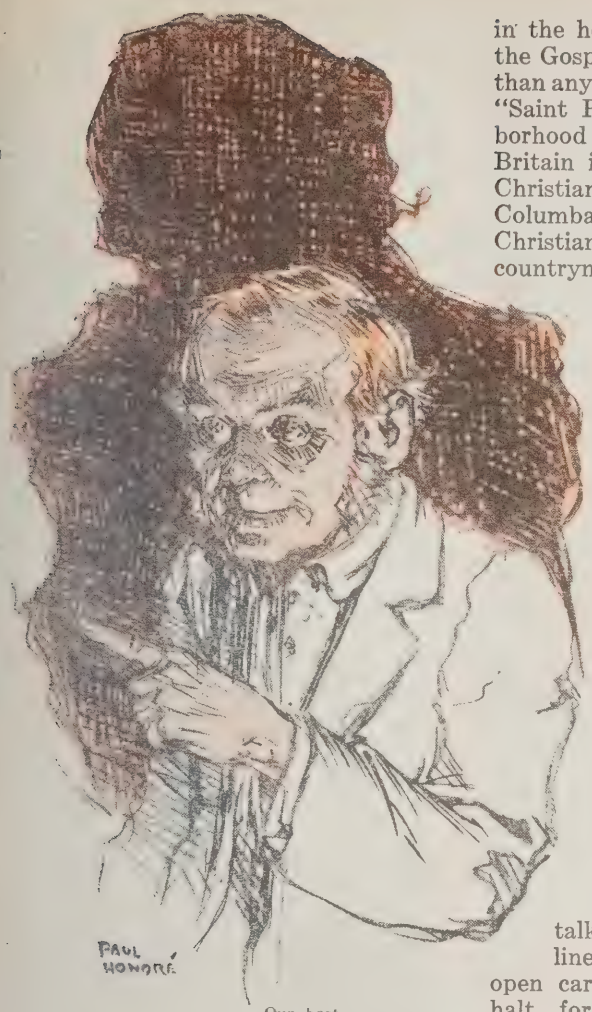
It is no light task that one essays in seeking to establish in the Ireland of today some contact with the pure stock of the ancient and amazing Gaelic people. Realize the difficulties. Discard in the first instance the name Ireland, bestowed by the Danes who ravaged and held the land between A. D. 800 and A. D. 1014, when the Gaels, at Clontarf, shook themselves free. You are in search of traces of the people who in A. D. 400, or thereabout, proved themselves highest in the scale of all the races of Western Europe.

Indeed, if the receptivity of a people to the teachings of Christianity be taken as the test of its life and ideals, the history of the progress of Christianity in the world shows that the Erin of the Gael (the Scotia of the Scots, as the Romans called it) held a people than which there was none in the world more fitted to appreciate the Gospel of Love.

There is no record of that Unknown Soldier of the legions of Julius Caesar who first took to North Britain the message of Christianity, but we do know that the old church councils held that St. Paul had visited "the Britannic Isles" in the first century planting churches, and we do know that from the *Candida Casa* in the south of what is now Scotland—Europe's most famous White House—the tidings of the Christian religion were taken to Erin by a young captive, whose message swept the Green Isle from end to end in thirty years, and initiated there a culture which rendered Erin supreme in Western Europe, in education and ideal, for four hundred years thereafter. The Gael was ready for the message. Has any other race exhibited equal readiness?

Saint Patrick's people are the people with whom you are seeking to establish some touch in your quest. For that reason you must remember that the Danish barbarians who in A. D. 800 took all of Ireland which they thought worth taking, who ruthlessly crushed out the centers of education and—as far as they could—the marvelous power of the Celtic Church, ruled Ireland for a period longer than that during which America has existed as an independent Republic. Recall further, the racial admixture resulting from that period of Danish occupation; the later racial admixtures of French, Spanish, Norse and mixed North British peoples; and you exclude from your area of investigation all of Erin which is best known and easily accessible.

Go by the Shannon. Beware of its beauty, unless you have unlimited time to spend. Throughout the whole two hundred and twenty-five miles of its course the Shannon will string you spots which are jewels of beauty and tempting to the wayfarer.



Our host.

and unspoiled places does one learn of the Gael. If one approaches the fountains of memory gently (there are barriers of shyness and reserve to be patiently put aside), if one has understanding and sympathy, if one has delicacy in giving (for the American will wish to give), and if, above all, one has a smattering of the Gaelic on the tongue, there is much to be gleaned; but the time of the gleaning is short, for these are days of swift change in the Isle. The points of contact are few, and passing.

"The temple of Truth has many doors: open them all." The particular door which may lead to the goal of your quest may be just such a door as was opened to us on a quiet summer night in the West of Ireland ten years ago, the door of a dilapidated cabin sheltering a remarkable character, now gone: a cultured "Gael of the Gaels," as he loved to term himself, who after years of no small part in the affairs of life and his country, had caught the peace of the glen. You will have fair fortune if you meet with such warmth of welcome as was ours, and find such a treasury of tradition as one lonely old Gaelic gentleman proved to be.

Before the first of the neighbors sidled in, "and welcome," we were listening to the history of the Celtic Church, in the heyday of which the "Light of the Gospel burned brighter in Ireland than anywhere else in Western Europe." "Saint Patrick came from the neighborhood of the *Candida Casa* in North Britain in the year 432; Ireland was Christian throughout by the year 465; Columba went from the Erin of the Christian Gaels to his emigrant fellow-countrymen in what is now Scotland in 563; Augustine's mission from Rome to Kent was in 597; the Celtic Church had an existence in Erin and in Scotland apart and distinct until about 1068, when, the Celtic Church in Erin being in ruins after Danish sway there, the Celtic Church in Scotland, came into fellowship with Rome."

So our host poured out the tale of Christian Erin; but the night deepened, and the neighbors took up such talk as one hears in lonely cabins in old Erin when darkness falls. There had been a funeral "over the hill." Recollections ran toward such events and the old ways thereanent. All had "heard tell" of memorable funerals; and as they talked one saw again the long line of mourners following the open cart through the wild glens, the halt for prayer at each crossroad; heard the death-song echoing amid the hills, and the wild "keening" of the hooded crone seated beside the coffin as she extolled the virtues of the departed and by no means forgot the shortcomings of any who might have been his enemies. Some recalled the custom, once followed when the head of a family died, of placing the body with the head at the foot of the bed—a custom, by the way, never observed in the case of women.

"Eastern survival," commented the host; "the spirit of the departed must be discouraged immediately from lingering in the vicinity of the body. In some remote parts of the East they go so far as to change the paths into the village."

In all the talk there was abundant evidence of the anxiety of the Celt to insure that on his passing he shall be "decently put away beside his own people." One neighbor "minded" the hoarding and "scranning" among his own people to provide, before death, suitable shroud, burial dress, and (in some cases) fine new shoes for the journey beyond the grave. Another had known instances in which the preparations included the provision of a tombstone. To a more distant time belonged the belief that the last person buried in a graveyard was junior to all others, and was called upon to be to them a general factotum, whose duty it was to fetch and carry as they ordered. This belief, as will be at once appreciated, gave rise to questions of precedence which were argued, doubtless, with spirit and vigor. Our host said it was on record that on an occasion when two funeral parties met at the gate of a cemetery they halted, neither group being willing to accord the other precedence. Eventually the matter proved impervious to argument, the bodies were put carefully aside, and the contending escorts fought each other to a standstill, several lives being lost.

Another burial custom which at one time was observed almost generally throughout the South and West of Ireland, and one by which the beggars profited greatly, was that followed especially in the case of the death of a child. On such occasions the relatives gave to beggars and the needy around loaves of bread and porridge bowls well filled, offerings supposed to insure the comfort of the departed in the journey beyond the grave. In that custom our gentle host perceived the survival—distorted, indeed, but basically evident—of Eastern influence. (In some parts of Celtic Scotland there is still a somewhat similar giving to the needy, on the occasion of a christening. The mother, on setting out for the church with her infant, takes with her a substantial "piece" of bread

A dilapidated cabin.

liberally buttered, and bestows it, for luck, upon the first child who crosses her path.)

Stories of magic, witchcraft, spells, the evil eye, and the fairy folk have much in common throughout the West of Europe, and, be the influences upon the fairy mythology of Erin what they may, the tales lose none of their eerie glamour when told to a hushed circle of Celtic people amid the stillness of the hills, the glow of the peat fire falling upon the tense faces, the minds of every member of the circle teeming with such tales from the past.

Our host claimed that in the fairy mythology of Erin, beneath superstrata deposited from obvious Norse and Gothic sources, there appeared everywhere evidences of its Eastern origin. It forms a strange medley, an evening's collection of reminiscences of half-forgotten customs and beliefs of which the country folk have "heard tell."

One Dread Remedy

There had been a time, it appeared, when earth from the grave of a priest or some other person noted for sanctity had been applied in the treatment of various diseases; and an earlier time when medicine, made from the earth of such a grave, mixed with water and potheen, was adminstered to ailing ones. The witches had been potent in Erin as elsewhere. Did an old woman appear at your door on May Day, begging "a kindlin' of fire?" Then she was indubitably a witch, and if you failed to rebuff her with appropriate exorcisms you had incurred the risk of dire evil. Did one suspect that the butter came slowly in the churn because some witch had laid a spell on the cream? There had been one dread remedy in the long, long ago—dip in the cream the left hand of a corpse. Of later date the cure had been to heat the colter of the plow in the fire, and if in the process appropriate reference were made by name to the suspected party, and if thereafter the butter came in reasonable time, there could be no doubt as to the spell having been laid on the cream by that particular person.

The power of the evil eye was a matter for dread. There was "the overlook" that caused lunacy and had other terrible possibilities. You will find in old Erin still the fear of the evil eye, despite the banter and ridicule with which the fear may be camouflaged. It was an ill-omened thing in the strange old days to praise any living thing "to its face." To utter a good word regarding a horse or a cow in the presence of the animal without first spitting upon the animal, or regarding a child without a preliminary "God save him," was, to put it mildly, an unfriendly act.

The doings of the fairies—the "good folk"—a propitiatory description rendered desirable by the omnipresence of those sharp little fellows—can still thrill an Irish audience in the quiet country homes, and, be it admitted, the stranger from the outside world may not always escape the weird spell of the telling. There, one may still hear of the fairies who were the especial appanages of distinguished families, and of how the heads of those families from time to time had been apprised by the family fairies of approaching trouble or of the coming of the Reaper.

There are remote parts of Ireland today where a man will not drink without first pouring a small libation "to the good folk," but the custom is almost dead. Many of the ancient *barrows* of Ireland—those relics of the time before the coming of the Gael—owe their preservation, it would seem, to the belief that they were the abodes of the fairies, and must not be disturbed by spade or plow. To build across a track believed to be used by the fairies was unthinkable in old-time Erin. The time has passed, however, when the peasant had difficulty in keeping out of trouble when an eddy of dust on the highway showed him that the fairies were there on a journey. The usual salutation from the mere human being on such occasions was "God speed ye, gentlemen." If one had the presence of mind, an effective safeguard was to cross one's self, for then, in addition, the fairy host would be thrown into such confusion that any captive mortals who might be with it would be enabled to regain their freedom. In all the land, however, there was no more potent or serviceable guaranty of immunity from fairy pranks, witch spells and the evil eye, than the personal possession of a "black-hafted knife."

"The Wren Boys"

Seasonal customs in Erin are for the most part now comparatively modern. A custom, now practically relegated to the past, was that which demanded that on the last day of the year the head of the family should dash a cake against the outer door of the house as a precaution against hunger in the year that was about to begin. "The Wren Boys," who were wont to parade the villages on Boxing Day bearing a beribboned holly bush from which many wrens were suspended, are unknown to many of this generation. The parading party had a song which laid stress upon the size and needs of the family of a wren, and the parade latterly was merely a hunt for "trate money."

The aristocracy of the tramp tribe ranged Ireland for generations. The *buckaugh* class is not yet extinct in the old land, but is now only a shadow of its former self. Development has reduced its status, and one does not now find in its vagabond ranks men of attainments who had yielded to nothing other than the gypsy in their blood and taken to the road. Tales of tramp aristocrats are legion, for the buckaugh was a remarkable figure in the life of the country for long. He was the newsmonger of the countryside, and welcome everywhere. His public services were many, albeit he contributed not of his labor to the general weal. As writer of letters, and reader of the same; as courier between lovers, intermediary between families and even factions, he was *liaison* officer, diplomat and plenipotentiary. His voluminous rags were but the livery of the tramp, for so well did the buckaugh fare on the gifts he received that he was able to sell a fair surplus to his lesser brethren of the towns.

The Largest Nugget

As the talk veered from one distinguished buckaugh to another, the aged Gael under whose cabin roof we were met recalled perhaps the most remarkable of the roving tribe, a "gangrel" from choice, an educated *hobo* who spent years seeking out the mineral resources of the Green Isle. This man claimed to know every deposit of coal and clay in the land, every "showing" of iron ore; he would talk for hours on "the lost gold of Wicklow," smilingly reminding his hearers that the largest nugget of gold ever found in the British Isles was found in Wicklow, and claiming that he believed he could locate the gold if he thought the finding of it would do Ireland any good. (The nugget found in Wicklow weighed twenty-two ounces, and was of pure gold.)

* * * * * * *

And so throughout the long, dark evening the talk runs in such cabins in those remote glens toward which your attention is directed here. There is rich reward to the seeker of the Ireland of the Gael. Beauty of scenery, kindliness of welcome, gentleness and dignity and idealism are there. That is an Ireland from which one will glean interesting things of which the foregoing are but examples, and ever and anon there may come to the memory for years after the pilgrimage the soft-spoken Gaelic words of farewell that fall like a benediction—"Safe home to you, by the help of God!"

Has Its Own Independence Day

By M. B. HOOD

CHARLOTTE, North Carolina, is the only city in the United States that does not unite with all other cities, towns, and hamlets in celebrating the Fourth of July as National Independence Day; it has an Independence Day all its own.

While every hamlet from the Canadian border to the Rio Grande and from the Golden Gate to the Atlantic will celebrate this year "the 149th anniversary of our independence," the people of Charlotte and in other cities of North Carolina will celebrate "the 150th anniversary of our independence."

The reason for this is that Charlotte was a year and sixty-five days ahead of the rest of the country in declaring itself "free and independent of Great Britain." Since that great event became a milepost in the history of America, the city of Charlotte and the county of Mecklenburg, in which Charlotte is located, have celebrated May 20, as the true anniversary of American independence.

Although all American historians duly record, and some detail at length, the fact that a Declaration of Independence, asserting the right of the American people to be free of Great Britain, was signed at Charlotte on May 20, 1775, the fact that the nation at large celebrates the Fourth of July as Independence Day has obscured the Mecklenburg declaration's importance.

When Charlotte First Celebrated

Through the years that have intervened since the American colonies began to expand into the present United States, Charlotte and Mecklenburg County have seldom failed to celebrate their great event in proper style, often with famous men of the nation as guests; twice with a President of the United States as the principal guest of honor, and twice with a Vice-President of the United States as guest.

The first President of the United States to journey to Charlotte to unite with the citizens of that city and thousands of others from North and South Carolina and adjoining states in celebrating the first declaration of independence signed in America was in 1909, when President Taft was the principal figure in the celebration—made memorable in the minds of the celebrants by a rain so torrential that it has been referred to since by local people as "the Taft rain."

In 1916, when the mind of the nation was absorbed with the cataclysmic struggle among the nations of Europe, and America's decision to enter the conflict was shaping itself for expression, President Wilson was the central figure in a celebration that lasted three days and came to a climax on the twentieth. On this date, the governors of North and South Carolina and other dignitaries were present, in addition to President Wilson; and the United States Marine Band, as on several former occasions of the kind, came down from Washington as token of interest in the event by official Washington. As on one or two previous celebrations in the history of Charlotte, the entire national guard of the state was present and joined in the picturesque pageant celebrating the anniversary of the first declaration of the American will to create a new nation in the West.

The first celebration of extraordinary proportions was on the one hundredth anniversary, at which were present the governor and most of the state officials, as well as officials from adjoining states and Washington.

The 1923 celebration was made conspicuous by the presence of General Pershing. In 1924, for the first time, the story of the first declaration of independence was told in pageant form, with floats and tableaux depicting the events that occurred in Charlotte one hundred and fifty years ago.

The text of the Mecklenburg declaration of independence is so similar in sentiment and expression to the national declaration as to give rise to suggestions that the framers of the declaration at Philadelphia may have been influenced by the former document, which had been sent to the Continental Congress previous to the drafting of the national declaration. The question is one for speculation, however, and is probably incapable of proof; though it seems not unlikely that so daring a step as the Mecklenburgers took might attract the attention of the members of the Congress at Philadelphia, when a copy of it was in the possession of their secretary.

Mecklenburg County Declaration

The text of the Mecklenburg County document (the original was lost in a fire that destroyed the home of Ephraim Brevard, one of the signers and one of the secretaries of the convention in 1800) reads as follows:

RESOLVED, First: That whosoever directly or indirectly abetted, or in any way, form or manner, countenanced the unchartered and dangerous invasion of our rights, as claimed by Great Britain, is an enemy to this country, to America, and to the inalienable rights of man.

RESOLVED, Second: That we, the citizens of Mecklenburg County, do hereby dissolve the political bonds which have connected us with the mother country, and hereby absolve ourselves from all allegiance to the British Crown, and adjure all political connections, contact, or association from that nation, who have wantonly trampled on our rights and liberties, and unhumanly shed the blood of patriots at Lexington.

RESOLVED, Third: That we do hereby declare ourselves a free and independent people; are, and of right ought to be, a sovereign and self-governing association, under the control of no power other than that of God and the general government of the Congress: to the maintenance of which independence we solemnly pledge to each other our mutual coöperation, our lives and our sacred honor.

RESOLVED, Fourth: That as we acknowledge the existence and control of no law, nor legal office, civil or military, within this country, we do hereby ordain and adopt as a rule of life, all, each and every of our former laws; wherein, nevertheless, the Crown of Great Britain can never be considered as holding rights, privileges, or immunities, or authority therein.

The Patriots and the Governor

RESOLVED, Fifth: That it is further decreed that all, each and every military officer in this county be hereby retained in his former command and authority—he acting conformably to those regulations. And that every one present in this delegation shall henceforth be a civil officer, namely; a justice of the peace, in the character of a committeeman, to issue process, hear and determine all matters of controversy, preserve peace, union and harmony in said county, according to said adopted laws, and to use every exertion to spread the love of freedom throughout America, until a general organized government be established in this province.

On May 30 of the same year, at one of the frequent meetings of the committeemen from the several districts into which the county was divided, further resolutions were adopted supplementary to and conformable with the spirit of the declaration of the twentieth, and "certain rules and regulations for the internal regulation of the country until laws should be provided for us by the Congress" were adopted. There were eleven articles of agreement adopted at this time, which some historians have confused with the articles of declaration that were adopted on the twentieth.

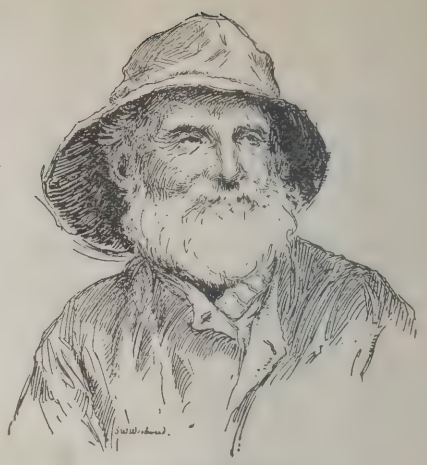
To grasp the situation in which the patriots found themselves at this time and to comprehend the spirit that animated them, it (Continued on page 27)

Gloucester Goes a-Fishing

How the Harvest of the Sea Is Reaped

By MAY B. WHITING

Drawings by Stanley W. Woodward



An island fisherman.

ALL the world loves a fisherman. Machinery and standardized living are all fine enough in their way, but the man who plays the game of life single-handed with nature will always remain a hero that every one of us has a lurking desire to emulate. Fishing is one of the most ancient trades in the world, and one of the most honored, and throughout the ages it has seen the fewest changes. Inscriptions on Egyptian tombstones depict men using, as today, the hook, the dragnet, and the harpoon.

Maine is pre-eminently the fishing state along the Atlantic seaboard, although no single port has the fame of Boston and of Gloucester, in Massachusetts. But their schooners demand men in the prime of youth and at the maximum of endurance, while Maine nourishes a stalwart race who, from father to son, go fishing throughout their working years. The numerous islands along the coast are their favorite habitation and every cove shelters a dozen or so craft which represent the wealth of the community. For every fisherman must have his own "bo-ot" and, with its brave little prow headed for the open sea, he is indeed lord of his destiny.

In early spring come the halcyon days of fishing, when the mackerel, in great schools, begin their migration from the capes off Delaware and Georgia. Like heralds before them come the smaller fry they feed upon, and in their wake their enemies, the shark, the porpoise and the bluefish, while the mackerel gull swoops down from above, and, working havoc in their midst, sail the schooners of men who have relentlessly pursued from southern waters. When the news that the mackerel have been sighted flies on its mysterious wings across the islands, every little boat seems to tug and pull at its moorings to get into the chase. At first it is a game, then a feverish obsession, more to get the fish than for the sake of the good money that they bring.

Seining is a favorite mode of fishing. It takes at least two boats to manage the great net which looks like a tangled heap of twine and cork, and it requires no little skill to get ahead of the school and stretch the net in their path. For the mackerel are timid. In some mysterious way they know the approach of danger, and with a flourish of their tails, all at the same instant, will swerve to one side, or, if that is impossible, dive beneath. But once within the net and the purse string at the bottom neatly pulled, the shimmering horde is safe.

A fisherman's home.

Again, the fisherman may prefer trawling, starting out at one or two in the morning for his favorite fishing ground, the lee of some island nine or ten miles out to sea. There he lays his trawl, letting out a long line with smaller lines and hooks attached to it and a buoy every so often to mark its location. When all his line is payed out he sails back on his course, pulling it in and taking off the shining, silvery fish.

Sometimes, in the still dark hours, it is like a little city on those lonely waters. Perhaps forty fishermen may choose the same grounds, each boat with its tossing lantern, and there will be hallos and shouted greetings between friends on different islands who rarely see each other except by such chance encounters by starlight or the first pale gleam of dawn. When the sun is high and the fish no longer hungry, the fisherman starts for the nearest market, perhaps Portland, to sell his catch. If possible, he will clean on the way, and then the gulls will follow in his wake, a cloud of them, swooping down with raucous cries, eating the refuse or carrying it far away to their nesting places.

But whatever method the fisherman may pursue, a good mackerel haul adds considerably to his monthly income. Those are the gala days when it seems as if a week's work would make him rich. But all too swiftly come the lean months when it seems as if the wolf, or perhaps the fisherman pictures it as the dogfish, were very near the door.

For in July comes another of those mysterious migrations, this time of a horrible creature, of more execrable character, according to the fisherman, than any with whom Dante has peopled his Inferno. In fact, the dogfish is a desperate looking villain. He is about three or four feet long, weighing five or six pounds, of a dark slate color, similar to that of a whale. He is without scales, of exceedingly soft and pulpy body, and a mouth set on the under side so that, like the shark, he must roll over on his back to bite. This monster, although of no great size, is unspeakably ravenous, eating everything in its path, devouring the catch on the trawls and twisting great hunks out of fish caught on the handlines before they can be brought to the surface. Throughout the summer months you hear of nothing but his vicious disposition and evil ways.

In general, while the dogfish are infesting the waters, the fisherman takes up the tamer pursuit of lobstering. Nearly every islander owns from sixty to a hundred lobster pots. These resemble nothing so much as great bird cages made of slats to permit the victim a view of the bait, usually a cod's head. One end is stretched with rope and in the center a circular hole is left. The trap is weighted with stone and a wooden bob floats on the surface. The lobster, scuttling merrily along the bottom of the sea, smells the bait, investigates, and soon crawls in, hind-first, as is his favorite mode of locomotion. Then he discovers that the hole

is too small to permit him to go out headfirst with spread claws, and in all the sad experience of the race it has apparently never occurred to any individual to turn around and go out the same way he came in. But perhaps the idea will dawn some day, for in his prison the lobster seems to give himself up to meditation. At least, he scarcely touches the bait that has lured him to his undoing.

The fisherman, now lobsterman, makes the round of his traps once a day and carries his booty to market, or, if that is too far, he returns to his own cove and puts the lobsters in his "cage," a box submerged just below the surface of the water. He knows that in a few days the lobster boat will be around and then he can sell his catch. The center of these boats is a large well in which the supply of salt water is constantly renewed by the simple expedient of having the bottom pierced with perhaps a hundred holes as big as silver dollars. Very awesome it looks to the landlubber who can scarcely believe that the compartments at the ends keep the craft afloat and that the water in reality only serves as ballast which other vessels carry. These boats go to Portland or along the coast where they sell to the wayside stores whose customers are the tourists in automobiles.

Even in the presence of his hated enemy, the dogfish, the fisherman must take a few chances in the grab bag of the ocean, at least with handlines. Perhaps it may yield him a couple of horse mackerel, weighing two or three hundred a piece, or a salmon, almost worth its shining weight in gold. And usually he visits the nearest pound two or three times a week for bait. A pound is a stationary net, fastened to poles, and so arranged that the fish, when they swim in, cannot find their way back. Every day a man rows in with a dory and scoops out the catch.

Unloading fish.

The pound may yield strange creatures, the monkfish, with its great round face, disquieting, like a man's, the sea-spider on its stilted legs, the sculpin with its grotesque head, its flaming eye like a baleful jewel, and its spots which quickly change to match its surroundings. Oddest of all is the squid, which combines the features of octopus, poll parrot, and squirt gun. About its head is a circle of tentacles in the center of which is a horned beak. When brought to the surface he squirts, first a stream of water, then one of jet black "ink." This original minded creature is much sought after for bait, and to catch him the hook must be greased with rancid butter. He also serves to while away the weary hours, for the fisherman is always ready to show him to the

After the day's work.

summer visitor, for whose eye the squid has unerring aim.

The petty affairs of the daily paper concern the fisherman little. Life is not to him a succession of days, but rather of tides, and of fair and foul weather. In the same way the years pass him by, and the veriest graybeard among them has an air of boyishness and contentment with life that makes you wonder how any one is willing to pay so heavy a toll for city living. The islander's life is lonely, but the loneliness of the ocean is quite different from isolation on land, for on the tossing waters there is something to enliven the faculties every instant. It may be the need to outwit a huge comber, or in the witching hours of moonlight it is easy to imagine grotesque apparitions lifting their dripping heads above the billows. As a usual thing the fisherman is deeply religious, with a sort of fatalistic acceptance of the chances of his career. There is seldom any drunkenness or profanity among them, and, at least among the island fishermen, the use of tobacco is rare.

His amusements, too, are far from the hectic flurry that goes by that name

A Gloucester fishing schooner.

in the city. When a boat is launched among his friends he dons his best and has a party to celebrate the event. It apparently affords him no small pleasure, too, to sit and gaze at the ocean for hours. The children want no playground but the rocks and beaches. Nearly every afternoon a dozen of them will build a fire under an old discarded ship-stove set up on shore, and they will hunt for crabs beneath the rocks. No prince, fêted at a table set with cloth of gold, could have a more delicious repast or one that is enjoyed with keener zest.

In the autumn the fishing is again good. The mackerel are gone, but there are always the cod and the hake, silvered and slimy to the touch, the pollack with his white stripes, and the haddock with his black. The haddock also has two "devil marks," the print of a smutty thumb and finger where the arch fiend lifted the father of the race from out the water. Then the fishermen sometimes go beamhauling, dragging a narrow, open net along the bottom of the sea, ensnaring everything it touches.

But in general the fishing of the long winter months is by trawling. Snug in his fishhouse, heated by a shipmate stove, the fisherman baits and coils his trawls, until he has two or three kegs full. Then out alone on the deep, in uncertain weather, with storms threatening, he pays out his hooks, sailing back and pulling in the hard, wet line, keeping one eye out for ice floes and another for great seas which threaten to engulf him. No man who is a coward will keep it up, but day after day the toil goes on. When the more experienced caution the youth, a laughing "the old pods are getting skeered" is the reply, and soon is heard the "chug, chug" of the little motor beating its way against the wind out to the open where fish are plentiful. (Concl'd on page 28)

Too Much Law in the United States?

(*Concluded from page 4*)

the legislature again meets, these lawyers would put into some definite form the ideas thus collected, and then put these concrete matters before the representatives in the legislature from the several localities where the lawyers may live, that some real constructive service would have been rendered by the bar of the state."

The Crying Sin of Most Legislatures

Mr. German may strike a popular chord with his views upon the repeal of laws, when he says: "The crying sin of most legislatures is to pass laws rather than to repeal them. I have often thought that a legislature would more nearly earn its monetary compensation, as well as the lasting thanks of the citizens of the state, if they would devote their time to repealing measures rather than enacting them.

"Of course, laws are necessary, but a multiple of laws simply means confusion. Where there are so many laws, the ingenuity of astute counsel can always be relied upon to find some plausible theory to urge in defense of a lawbreaker, and therefore the lawbreaker, knowing this, is encouraged to continue his nefarious designs. Whereas, if the commands of the law were fewer in number, but the penalty for violation thereof drastic, in my opinion, we would be on safer ground than we are today.

"There are now on the statute books of Missouri some 13,890 sections. Of course, you will understand that, while these are separate sections, nevertheless they are not all laws in the sense that they are complete in themselves. It would be difficult indeed to compute just how may laws there are, as distinguished from sections.

"Strictly speaking, none of the laws are obsolete, although a great many of them are quiescent. Of course, it goes without saying that there are too many laws in this state, and no doubt in every other state in the Union."

Another remedy is suggested by Stone Deavours, president of the Mississippi State Bar Association. It is that of constitutional restrictions, together with the election of more intelligent legislators.

"There is no doubt in my mind," says Mr. Deavours, "but that too many laws are enacted in this state. The multiplicity of laws has led to great confusion.

Does Not Know of Any Remedy

"I do not know of any remedy to suggest to prevent such a vast number of enactments by the legislative body. The legislature is one of the coördinate branches of the government, and, when in session, is supreme in the legislative field, and, of course, can legislate about anything and everything about which it cares to legislate and about which the constitution permits it to legislate. Perhaps some constitutional restrictions would be helpful; but probably the best remedy would be the election of more intelligent men to the legislative body."

It is related of a very wealthy man, residing in an eastern state, who possesses large property interests in several states, that he employs agents to attend sessions of the state legislatures and to report passage of new laws creating offenses or imposing penalties, that he might regulate his conduct in such a manner as to keep out of jail.

Confusion Worse Confounded

An interesting picture of this phase of the complicated mass of conflicting laws is furnished by E. S. McAnany, president of the Kansas State Bar Association, who says: "I do not see how, in a nation of forty-eight sovereign commonwealths, each subdivided into townships and municipalities, a large number of statutory enactments can be avoided. The average man lives, and his property interests are located, in a single state. To such a one, municipal ordinances, state statutes, and national enactments should not be bewildering in number. If he has property interests in forty-eight sovereign states and a few foreign nations, and tries to grasp and follow the statutes and regulations of each jurisdiction, the task is apt to prove too much for one brain.

"We have too many laws, but a good deal of confusion could be avoided by periodical drastic revisions such as Kansas has recently enacted and congress is contemplating.

"Scientific advancement and social development bring about rapid changes of conditions that necessitate new regulations which must be met by statutory enactments, rather than waiting for usage and custom to crystallize into laws.

A State Which Has No Obsolete Laws

"The Revised Statutes of Kansas now consist of 83 chapters and 12,112 sections in a volume consisting of, including indices and other addenda, 1,645 pages. Revised in 1923.

"Since our revision, there are now no laws of a general nature in the state that are obsolete. Some of the reënacted provisions of the Revised Statutes, because of their extremely limited application, might be considered obsolete, but are not technically so."

There are approximately 16,000 sections in the Ohio general code, according to William L. Hart, former president of the Ohio State Bar Association, from five to ten per cent of which are obsolete in that they are seldom, if ever, used.

While giving no specific remedy to decrease the number of laws, or to prevent the enactment of additional statutes, Mr. Hart says: "The only manner in which the volume of statute law will be decreased or the rate of increase of statute law be lessened, is the adoption of some general principle and the application of that principle unsparingly to every field. The great diversity of modern life makes it unavoidable that there should be much legislation that affects relatively few; but the majority has no right to deny the benefits of legislation to the minority, merely because it is a minority. Standards of judgment should be, not as to what will be best for the interests of the majority; but what does the majority think will be best for the interests of all? The difference between these two standards is as wide as the distance between the poles."

Sifting a Mass of Material

Upon retiring as president of the American Bar Association, Mr. John W. Davis addressed the annual convention of that organization at Minneapolis on August 29, 1923. During his speech he remarked about the "18,500 volumes of reports and inundation of statutes that constitute a complete American law library today." "Of course," said he, "no lawyer, however long-lived or industrious, and no law office, however numerous its force, can pretend to sift a mass of material so vast as this."

Up to within recent years, lawyers were in overwhelming preponderance in the legislative halls of the country at large. They are still in a majority in state legislatures. It is pointed out here that the incoming Congress of the United States will contain, in its House of Representatives, more than two hundred and ninety lawyer members out of a total membership of four hundred and thirty-five.

Still, with the undoubted imprint of these legal minds upon the laws on the statute books in the United States, other legal minds, much in the majority, outside of legislative halls, seem to be of the decided opinion, as indicated in this article, that we have "too much law."

No Way Appears Out of the Tangle

Eliminate opinions as one may, sift out what appear to be futile remedies; still, nothing tangible and direct appears to hold promise of lessening the number of existing laws to any marked extent, nor to point the way to a method of slackening up activities on the part of state and national legislatures.

The eminent men quoted in this article have spoken candidly and freely.

May-Day Dawn in Oxford

—Oxford, England.

AT CERTAIN times even the most unimaginative of us step over the borderland into that other kingdom which enables us as detached beings to see the fairy breath on things around us. This morning, early, was such a time for me.

Dew, so much of it that it seemed to have just stopped raining, was on the long, unkempt grass of our straggling garden and on the gray stone roofs of houses across the way. (And isn't this the dew that gives whoever washes in it everlasting beauty?) Birds were chirping reluctantly, and some of the big, iron-bound doors of the old colleges stood open. Here and there was a college portal yet unlocked where all inside was still and sleepy.

Around the turn into "the High" it was different. For here were people awake—and the time near five o'clock—people who ordinarily would just have turned over in their beds for the last lap of a comfortable night. Bicycles flanked the whole width of the street, and, between and around them, people were walking.

The niched stone of medieval buildings on either side interspersed with shops that from their very age claimed a dignity that comes from jutting upper stories and small-paned windows, looked out tolerantly. And farther along, in a tower high above the street, bells rang out their simple, quarter-hourly intonation.

But it was not this that had crowded the bridge below—nor yet this that had caused punts and canoes and small boats to line the river-edge beneath, their occupants waiting expectantly. Up on the tower there was a fluttering of something white—the white surplices of the little choir boys.

It was the hour, and hark!—the Latin words of a Requiem Mass, sung for the first time for the soul of Henry the Seventh, came down to us. Till the very end I sat on the stone railing of the bridge below almost holding my breath to listen the better.

". . . . . love is sung
By every age, in every tongue."

How many people have been thrilled by this same vibrant appeal? Those naughty little boys who would unscrew your bicycle bell on ordinary days were now lifted high above you till they might be angels singing from the rain-gray skies.

Then came the full swing of bells. The crowd moved away in all directions, and the little crafts in the slow-moving, muddy river glided on to green places higher up the stream. The tune of Morris dancing was struck up in the street, and some stopped to watch. A fruit vendor in a tall gray hat pushed his way among the people calling his unwanted, "Bananas."

I went down beside the river where a fallen willow furnished a bumpy seat. Here a cold breakfast was made palatable and delicious by its setting, and there passed friends and not-friends, a floating show of merriment and gaiety.

Riding home, the morning was still crisp and green—such a shade as never can be copied. And from among the wee, new-sprouted, baby leaflings of a roadside hedge came the reiterating greeting, "Cu-koo, cu-koo, cu-koo."

In such a way, May dawns in Oxford.

(C) Underwood & Underwood.

Magdalen Tower, Oxford, England.

Billy O and I

(*Concluded from page 2*)

alluded to by Sir William in his letter. Yes, Sir William, it is true enough. Looking back over the years, from the comfortable depths of this armchair, back past the war and all the strange adventures that have come our ways, it is strangely vivid. Billy, we had decided, should enter for the club tournament.

Now let there be no mistake about it, it was a great affair. Players from far and near came to compete. Several of us decided to enter, knowing full well that we would not get beyond the first round, but with Billy it was different. Billy was the dark horse. Billy, dancing round like an inspired imp on the back line, or glowering at his opponent with his chin just over the net, might do anything. And so Billy entered. The weather was perfect on the opening day, as it was on all the days that followed, and Billy was the hero of every day. The rest of the gang was scattered in the opening hours, but Billy, Billy won his way through to the finals. Now the final day of this particular tournament was a great day; it was a full-dress day; all the countryside would be there in full dress. And so the night before, the gang held a meeting. Billy must make a great and creditable showing. Billy, above all things, must be dressed for the occasion. He must wear "whites"; whites in the finals were *de rigeur*. Billy protested. He did not have a pair of whites, or, if he had, he did not know where they were. We insisted; Billy protested, but finally declared that he would get a pair somewhere. And so we left it.

.....

Well, Billy was as good as his word. But he forgot about them until the last moment, and, then, as ill luck would have it, the only man who had a pair of whites to lend him was a giant. But what did that matter to Billy? With the waist well up about his armpits, with several reefs in the trouser legs, he appeared on the court at the appointed time. The gallery roared, and the gang cheered, but before very long both gang and gallery were cheering together. For never before had Billy been in such form. He went from strength to strength; he was everywhere at once; his hair became ever more tousled; his face was smeared with dust and whiting; the trousers sagged and shifted, but Billy played on and on, and —won.

When Must We Have a New Canal?

Panama's "Big Ditch" May Soon Become Too Small for the Increase in Traffic

By OTTO WILSON

Native shacks in the village, Taboga Island.

EVENTUALLY, as everyone admits, the United States will have to get its steam shovels into action again and dig another canal between the Atlantic and the Pacific. But how soon will that become imperative? In the last two or three years the traffic through the Panama Canal has taken such great leaps forward that the time may be nearer than we have been counting on. If anything like the present increase keeps up it will only be a few years before we shall have to face the alternative of enlarging the present canal or building a new one.

Two years ago Colonel J. J. Morrow, then governor of the Canal Zone, made an address before the New York section of the American Society of Engineers in which he said:

"A conservative estimate of the lockage capacity of the present locks, allowing the periodical unwatering of one flight for painting and repairs, is 50,000,000 net tons of shipping *per annum*, or more than four times the present volume of traffic . . . .

"While any computation of the future growth of traffic is subject to error, it is believed that the 50,000,000-ton mark will not be exceeded before 1955. In other words, the present canal should prove adequate to meet the demands that will be made upon it for a period of about thirty years. Beyond that it is futile to prophesy."

Colonel Morrow's caution in making future estimates was amply justified in the next two years. When he spoke, the biggest single year's business done by the canal was the handling of 11,000,000 net tons of shipping in 1922. In the next year this total jumped to 18,000,000 tons, and in the year following to 26,000,000 tons. In two years the traffic thus grew from less than one-quarter of the canal's capacity to more than one-half.

A continuation of this tremendous increase of more than 100 per cent in twenty-four months is not to be counted upon for the immediate future. If it were, we would already have to be digging away night and day on a new waterway if we wished to meet the full demands of the world's shipping. A large part of the increase has been due to the shipment of California oil to the East, a traffic which reached its peak in 1923 and has been falling off since.

But aside from this special business the handling of ships carrying general cargo increased 50 per cent in the two years. For one thing German shipping is rapidly coming back. In 1921 only thirteen German ships made the transit through the canal and the German flag ranked thirteenth on the list of those passing through the locks. In 1924 it ranked fourth. Most other maritime nations likewise record a steady growth since the close of the war. If this growth continues, even at no greater rate than the present, the canal must in a very few years begin night operation, and beyond that looms the date, not so far ahead, when the canal authorities will be announcing a capacity business.

Moreover, it is always to be kept in mind that the tidal wave of oil, which has now partially subsided, may at any time come surging in again, either from our Pacific Coast, from Mexico, or from South America. If the canal is to handle this or any other sudden wave it must keep a margin of several million tons between actual business and capacity. Long before 1955, therefore, we must have much greater canal facilities than we have now, if we are to be safe. And long before that, if these additional facilities are to take the shape of a new canal, for whose construction experience shows that we would have to allow ten years, we must be laying plans and making up our national mind to get at the job.

There is, furthermore, always the pressure of national defense making for the building of a supplementary passageway for our battleships. The Panama Canal stands today as the Achilles heel of our naval defense. By a single big explosion, accurately placed, an enemy might temporarily sink half our navy. But with two canals instead of one to be blocked, the attempt would be so unlikely of success as hardly to be worth the planning.

When once we do decide to take up canal-digging again we can go ahead with a huge confidence, not only in our ability to carry the job through but also in our ability to handle and operate a canal successfully and make it pay. Our experience with the Panama Canal amply justifies us in counting on such success. Not many Americans who are so proud of the record made in digging the canal know that they have equally good grounds for being proud of American efficiency in managing it.

So smoothly has the canal functioned in its first decade of

City of Panama, from Ancon Hill, showing new concrete reservoir and administration building.

existence that it has come to be taken quite as a matter of course. What sort of record has it been making in these quiet years? How has it justified the high hopes roused at the time of its construction?

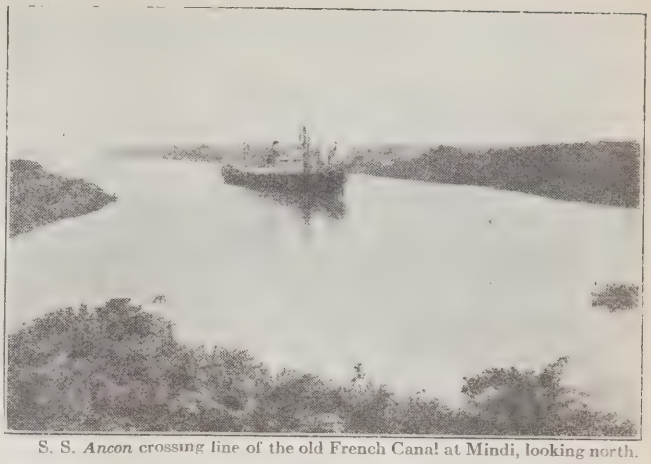
The answer can be tersely stated. It has been an immense success. Mechanically, financially, and as an aid to national defense it has met every expectation, and has far surpassed conservative estimates of its usefulness. Briefly summarized, this is what it has accomplished up to the end of 1924:

It has passed through from ocean to ocean 27,000 toll-paying vessels, having a net tonnage of 112,000,000 tons and carrying 120,000,000 tons of cargo, besides some 2,500 non-commercial vessels which paid no tolls. This is a tonnage twice as great as the total world tonnage of merchant ships in existence today. In 1924 alone the tonnage of ships passing through the canal was 50 per cent greater than that of the whole merchant fleet of the United States.

It has taken in in tolls more than $108,000,000 and from other sources several million more, making a total earned revenue of almost one-third the original cost of construction.

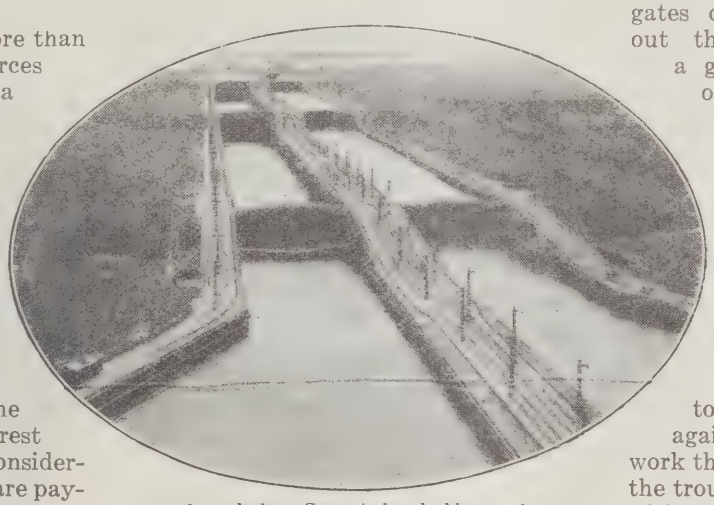
It has attained a position where it is not only paying all costs of operation, all expenses of maintaining the canal and governing the Canal Zone, and all charges for amortizing the minor business enterprises, but it is also returning to the people of the United States a rate of interest over and above these outlays considerably greater than the rate they are paying on the bonds issued for its construction. Purely as a business enterprise the canal is paying dividends, and will pay far higher dividends from now on.

Its management has operated successfully and profitably a railroad and a steamship line; cleared (and kept clear) 50,000 acres of jungle for pasturing cattle; built up an excellent service for ships; carried on first-class hotels, restaurants, and commissary services for employes and travelers; and so administered the affairs of the Canal Zone that that ten-mile strip of territory is probably the safest, most law-abiding, and healthiest land under the American flag.



S. S. *Ancon* crossing line of the old French Canal at Mindi, looking north.

Thirteen years ago Professor Emory Johnson, eminent authority on water transportation, made an exhaustive study of possible canal traffic, to set a fair rate of tolls. Basing his forecast on the normal course of commerce he estimated that by the fiscal year 1925 the canal should be earning in tolls $17,500,000. At the very opening of the canal normal commerce was dealt a staggering blow, from which it was long years in recovering. Yet in the fiscal year 1923 the canal had reached and passed Professor Johnson's estimate for 1925, earning in tolls that year $18,600,000, and for 1924 turning into the Treasury $24,000,000. As noted, nearly one-third the original cost of building has already been covered by canal revenues. Even if the annual earnings do no more than maintain their present level, the other two-thirds will be covered by the time the canal has completed a second ten years, with several million left over to apply to the interest, operation, and maintenance costs over the two decades.



Gatun locks. General view, looking south.

But let no one think that this gratifying result has been achieved simply by filling and emptying the locks for passing ships. For Dame Nature is a resentful jade when crossed. She did all she could to keep these humans from building a canal, and now that it is working she is always watchfully waiting for a chance to damage or destroy it. She is likely at any time to slip casually into the canal a hundred thousand tons of rock and earth. She may evaporate the water in the big lake-reservoir and lower the depth in the canal, or she may open the rain gates of the sky and try to wash out the man-made mechanisms in a great flood. The little army of Americans on the Canal Zone are engaged in an endless battle to hold her under control.

The first of these dangers, the famous slides, is no longer much of a menace, but they are not yet "dead." Not far from the danger zone two dipper dredges are kept always ready for action. When the word flashes to them that the earth is slipping again they instantly drop whatever work they are about, fly to the scene of the trouble, and attack the obstruction without the loss of a minute. On one occasion one of these dredges, a mile and a half away, was at work on a big slide fifty minutes after it received the news. Another made a record of dipping up rock and earth and dumping it into scows at the rate of more than a quarter of a ton a second for twenty-four hours. Because of their alertness and speed no slide has held up shipping, save for incidental delays of a few hours, since 1920. The last serious slide occurred in October and November, 1923, when half a million cubic yards of rock slipped into the canal prism, blocking two-thirds of the channel but not stopping the passing of ships.

Drought during the four months of the dry season will be much more serious in a few years than it is now. The operation of the locks will empty more and more water from the reserve in Gatun Lake as canal traffic increases. The canal management has laid plans to build another gigantic reservoir at a higher level than Gatun Lake, and if Congress says the word the engineers will soon be at work upon it. Excessive rainfall is also a menace to be watched. A year and a half ago the record rainfall since (*Concluded on page 26*)

Gatun Lake, the dying jungle.

"I Read in the Papers—"

I read in the papers that William Montgomery Brown, one-time bishop, has made the front page again. And William Norman Guthrie, of St. Mark's-in-the-Bouwerie, made it with him. Which revives the old-fashioned idea of humorists traveling in teams. Both gentlemen have rather failed of publicity of late, the former since his trial, the latter since he took the bare-footed lassies away from his altar where they used to "interpret" Mr. Guthrie's brand of Episcopalianism through the medium of what clever writers call "the light fantastic." Mr. Brown is a kind, nice old gentleman who began late and is still somewhere back in the period B.B.I.—that is, Before Bob Ingersoll. He has only recently discovered Darwin and is quite upset. His "new doctrine" is much older than the theology he attacks. Now he never will catch up. If he did, he would find himself more orthodox than any of the bishops. As to Mr. Guthrie, I don't know precisely what his ailment is. But though they have both made the front page again, they're slipping—slipping fast—unless their stunts gather more pep.

I read in the papers a great variety of stunts. In olden times newspapers used to give away baseball bats or sets of dishes as lures to obtain subscribers. Now, however, they put on more pretentious "stunts," and some of them not so bad. The London *Times* raised more than a million to make safe St. Paul's, and it is a safe bet that the *Times'* circulation did not suffer. Various American newspapers offer accident insurance to their readers—rather handy in these days of S.O.S. Others build model houses and have the whole town looking on to see how it is done, and get new ideas of housing comfort. Then there are spelling bees that enthuse entire cities, and an oratorical contest which sets all the high school students of the nation studying the Constitution. All these may have their commercial appendages, as what has not?—but there are ideas behind them and public benefits before them.

I read in the papers (this time *The Jewish Chronicle* of London) something which shows which way the wind is blowing. Speaking of the rising tide of critical attention toward the Jew which is evident in England on account of a perfect avalanche of fraudulent trading, the Jewish writer says: "There can be little doubt that the fraudulent trading which has come to light is unenviably prominent among Jews. Mr. Stiebel emphasized the fact that the prominence was provided by alien Jews, but for my part I cannot see that the differentiation has any bearing on the question. It is said that Jews from Russia and Poland living here have not learned English ways, nor absorbed English ideals, but have pursued alien ways of trade and foreign methods of doing business . . . I, for one, refuse to shake off the clear obligation of Jew to Jew by accounting for the lapse of some of our people by pleading they are 'foreigners.' In addition, I doubt whether the cases of fraudulent trading to which Mr. Stiebel alluded are really those of foreign Jews to the extent he evidently imagines. I have noticed in a number of such that the persons guilty were Jews who, even if they were not born in this country, came here as young children, were educated here, and had time and to spare to assimilate English ways. So that the whole difference can hardly be between ways that are English and ways that are foreign."

When Must We Have a New Canal?

(*Concluded from page 25*)

the opening of the canal occurred, when twenty-seven inches fell in two days. Shipping was stopped while the culverts of the big locks were opened wide to help carry away the extra six billion cubic feet of water, but no damage was done and the locks were soon passing vessels through as usual.

Two countries stand out as the big beneficiaries of the service which the canal offers—England and the United States. For a while England occupied the field almost alone. German ships had vanished and the great fleet of American ships had not yet come into being. For the first four years British shipping led all other in using the canal. Since 1919 American shipping has held first place and for the last two years our total has been twice as large as that of the British. Between them they account for three-fourths of all canal traffic, but the other fourth includes ships bearing the flags of thirty nations.

In 1924, what with the great flow of oil, the traffic between our east and west coasts made up fully half of the total handled by the canal. This is a higher proportion than normal, but it is in line with a steady growth in trade along this route which has been going on since the close of the war. Those whose political memories go back to the far-off pre-war days of 1913 will remember what a battle raged in Congress over the question of free tolls for American ships in the intercoastal trade. Had President Wilson failed in his fight for the repeal of the free-tolls law, the income from the canal would have been lessened, in the last four years alone, by $27,000,000.

If the management of a second canal could come at all near duplicating the success of the operation of the Panama Canal we could subscribe to the hundreds of millions in new bonds cheerfully, knowing that the enterprise was a good paying investment and not a dead expense.

What About Your Budget?

(*Concluded from page 5*)

puzzle. And it is much easier to remember the United States coins spent for lunch than Assyrian coins of five letters!

The simpler the budget the better you'll like it. Seven or eight heads are sufficient. If your budget is hydra-headed it becomes a real monster. Shelter, food, operating expenses, clothing, recreation and savings we must have. Recreation may include amusements, books, magazines, newspapers, church, and charity contributions, and all things of that kind. Have a separate column for your car, and one that can hold insurance, taxes, and gifts and loans. (You'll be surprised at how much easier it is to figure an income tax if you have a budget before you!) You can get everything under these heads, without puzzling your brains as to where odd items belong, if you make a personal allowance to each member of the family.

There is the question of doctor's and dentist's bills, but we work that by a temporary savings head. Our real savings are permanent, but we run another for emergencies. If it accumulates we use it for new furniture, or a trip.

With a budget we know what we can have, so we do not think too much of the things that are out of question. We also know where we can shave off if we need extra money. We once turned our amusement fund for months toward a new car. We've changed those columns three times to include babies!

I have never tried to be too scientific. My household expense sheet is always a big calendar, which has the days of the month marked on squares large enough to hold a number of figures. This hangs in the kitchen, and it is easy to put down "vegetables, 55 cents," or "cash-and-carry, $2.74." I keep an expense book, but do not even transfer these figures daily. Checking up at the end of the week is easy. The fifteenth of the month I usually see if we are running true to form, and if we have exceeded on any item I cut down for the other two weeks. But I advise anyone just starting to budget to keep *EXACT* daily accounts for three months. It takes that long to get budgetized! Once you are sure the budget has taken, you may relax a little.

Even admitting that it *IS* a little trouble: *BETTER A BUDGET THAN BILLS WHICH YOU CANNOT PAY!*

Has Its Own Independence Day

(*Continued from page 19*)

is necessary to recall that on May 16, 1771, four years previous, Tryon, Colonial governor of North Carolina, had sent forces to disperse a band of regulators, who had been formed to maintain peace and order, and also, it must be admitted, to see that the rights of the community were not invaded by the high-handed methods the governor was using at that time. The clash between the patriots and the governor's forces resulted in the loss of a number of lives. The event is known in the history of North Carolina as the "Regulation Battle" and this fight on Alamance Creek, sixty miles from the Charlotte courthouse, is reckoned the first armed resistance to British authority ever made in America.

The patriots had this and other grievances in mind, including the odious Stamp Act, when the step toward actual separation from the mother country was taken.

Prior to 1775 the County of Mecklenburg had been accustomed to have meetings at the Charlotte courthouse, seat of government of Mecklenburg County, to which representative men went from the different militia districts.

The Charlotte courthouse.

It was when one of these meetings was in session at the little log courthouse on May 19, 1775, that an express from the North rode into the village, having made the trip on horseback from Massachusetts in one month, and brought the tidings that, one month before, British soldiers had actually spilled the blood of American patriots at Lexington. The tidings served to inflame the mind of the patriots, already stirred by the events of recent occurrence in the province, and there was a general rush of the population of the village to the courthouse where the committeemen from the militia districts were in session. After a session that lasted far into the night the meeting was adjourned until noon next day. In the meantime, the news brought by the courier from the North penetrated to the rural communities around Charlotte, where most of the committemen lived; and when the session was reconvened at noon next day there gathered anxious mothers, wives, and men who were not members of the convention but interested onlookers.

Abraham Alexander, magistrate, former member of the Colonial Assembly and ruling elder in Sugaw Presbyterian Church, in whose district the Charlotte courthouse was included, was made chairman of the meeting. Ephraim Brevard and John McKnitt Alexander, "men of business habits and great popularity," were made secretaries of the convention. Rev. Hezekiah Balch, pastor of Poplar Tent Presbyterian Church and a stalwart character in this settlement of Scotch-Irish Presbyterians who took their religion seriously, addressed the convention. So did William Kennon, Esquire, a lawyer, and Ephraim Brevard, and others. After discussion, it was voted that a committee composed of Ephraim Brevard, William Kennon, and Mr. Balch, should retire and consider resolutions. The members of the convention, at the recital of the news from Lexington, had cried out, "Let us be independent. Let us declare our independence and defend it with our lives."

The committee had in its possession copies of a tentative resolution read by Ephraim Brevard a few days before to a group of patriots gathered in the Queen's Museum located near the courthouse, the first educational institution founded in the settlement. These resolutions were to be considered and revised if the committee thought well of them.

When the committee returned, the chairman, Abraham Alexander, called for their reading, a request complied with by Ephraim Brevard. Then he said to the assembly, "Have you all agreed?" This question was answered by a roar of "ayes," and Colonel Thomas Polk, commander of the militia in the county, was directed to read the declaration from the courthouse steps to the populace waiting outside.

Captain James Jack, a notable man in the community, was at once intrusted with a copy of the declaration which he was to take to the Continental Congress then in Philadelphia. Another was prepared for submission to the Provincial Assembly which had its session at Halifax.

On arriving at Salisbury, forty miles from Charlotte, on his journey to Philadelphia, Captain Jack was asked by William Kennon, a local lawyer, to allow a reading of the declaration at a gathering of citizens. He permitted this to be done, and the document found general approval among the residents of Salisbury. Benjamin Booth and John Dunn, two citizens, dissented from the view of the others and declared the affair at Charlotte a treasonable offense. When word of this incident came back to Charlotte, twelve men on horseback were dispatched to Salisbury to bring Booth and Dunn to Charlotte to answer for their expressed views—this in conformity with the spirit of the declaration, according to which those dissenting from the purpose of the declaration or seeking to hinder its operation were enemies of the country. That the Salisburians generally shared the views of their fellow patriots at Charlotte is shown by the fact that there was no opposition to the arrest of Booth and Dunn. They were taken to Charlotte and later to South Carolina for detention until the case could be suitably disposed of.

The Provincial Assembly in session in the following month at Halifax, in the eastern part of the state, approved the action of their forward-looking fellow countrymen at Charlotte by adopting a resolution instructing the three North Carolina representatives at the Continental Congress in Philadephia—Hooper, Caswell, and Hewes—to vote in favor of independence

from the mother country when the matter came up there for consideration. As a matter of record, Continental Congress received the resolution from the Provincial Assembly of North Carolina but tabled the document for the time being, until the sentiment of the Congress crystallized by the Fourth of July of the following year, 1776, in favor of absolute independence. Because of the incident at Charlotte and the approving action of the Provincial Assembly at Halifax, the North Carolina flag is ornamented with the two dates, Mecklenburg County, May 20, 1775, and Halifax, April 12, 1776. The Halifax anniversary is a bank holiday in North Carolina by act of the legislature.

The men who signed the Mecklenburg declaration were mostly elders of Presbyterian churches in the distinctive Scotch-Irish settlement that constituted Mecklenburg County. They had come, either themselves or their immediate forbears, in tide emigration, largely Scotch-Irish, from Pennsylvania and Maryland. Their ancestors were only recently immigrants from Northern Ireland, whence they moved after the Battle of the Boyne. Seven Presbyterian churches in Mecklenburg County, with one of the seven located near the courthouse at Charlotte, were the nuclei around which the settlements centered, and the ministers of the seven churches were to a notable degree the leaders of thought and the molders of sentiment that resulted in the Declaration of Independence. The religious persecutions their forbears or themselves had fled from in Ireland was fresh in their minds. One of these was the Rev. Alexander Craighead, pastor of Sugaw (an Indian name afterward corrupted to Sugar) Creek Presbyterian Church. His fiery utterances and his unrelenting denunciation of the tyranny of the British Crown were credited with having done much to kindle the fires of liberty, and his grave at Sugar Creek Church, just outside of Charlotte, is one of the patriot shrines of the community.

The men who have left their names on record as pledging their fortunes, their lives, and their sacred honor to set up an independent government in the practically unbroken wilderness, and to light the torch of liberty that flickered in the South until the victory of Kings Mountain, and blazed into triumph at Yorktown, were Abraham Alexander, chairman; Ephraim Brevard, secretary; John McKnitt Alexander, secretary; Rev. Hezekiah J. Balch, John Phifer, James Harris, William Kennon, John Ford, Richard Barry, Henry Downes, Ezra Alexander, William Graham, John Queary, Hezekiah Alexander, Adam Alexander, Charles Alexander, Zaccheus Wilson, Jr.; Waightstill Avery, Benjamin Patton, Matthew McClure, Neill Morrison, Robert Irwin, John Flenniken, David Reese, John Davidson, Richard Harris, Jr., and Thomas Polk.

A steel plate marking the location of the Charlotte courthouse, from the steps of which Colonel Thomas Polk read the declaration of independence to the approving multitude, is located in the very heart of Charlotte, now a growing industrial city, and is pointed out to tourists as the scene of the first step toward American independence.

Two squares south, on the ground where the Queen's Museum stood, is a tall granite shaft erected to the memory of the patriots. The Queen's Museum was so called in honor of Charlotte, wife of George III, for whom the city was also named. The county was called Mecklenburg after the home of Princess Charlotte, in Northern Germany. On the monument is a roster of the signers of the declaration. On another face of the shaft are inscribed salient passages from the declaration document and a hornet's nest, symbol of Charlotte, with an inscription underneath attributed to Lord Cornwallis, commander of the British forces there in September of 1790.

Cornwallis from time to time sent out foraging parties, and his forces had many skirmishes with the patriots. At the McIntire farm, nine miles from Charlotte, an iron marker indicates the scene of a battle that resulted in the loss of a considerable number of Cornwallis' soldiery. Twelve American patriots left their plows, ran for their long-barrel rifles and sniped the British column from bushes and trees. Cornwallis had defeated the American forces under General Joseph Graham, some months before, after General Gates had been disastrously defeated by the British at Camden, South Carolina.

Cornwallis wrote to his superior officers that he had "got into a veritable hornet's nest at Charlotte," referring to the fiery fighting qualities of the inhabitants and the incessant attacks upon the foraging parties that he sent among them.

Three miles east of Charlotte stands the Hezekiah Alexander home, erected in 1774, a year before the Mecklenburg declaration. It is two stories and a garret in height, with a spacious basement; built entirely of stone, it is practically as substantial as in Colonial days. After the signing of the Mecklenburg declaration of independence, Hezekiah Alexander, who was widely esteemed for his scholarship and his knowledge of law, was a member of the convention that framed the constitution of North Carolina. His residence is another of the shrines of patriotism about Charlotte and is the only house still standing in the bounds of Mecklenburg County that was standing in Revolutionary days.

Gloucester Goes a-Fishing

(*Concluded from page 21*)

Perhaps, to have his fling in life or to lay by money for a boat of his own, the islander may join the fleet. He may go south with the mackerel catchers and follow them on their migration. He may go with swordfishers, watching far out on the bowsprit for the purple gleam that marks the presence of the sea monster. Or he may sail in a swift schooner for the Banks to hunt the cod. Over those storm-tossed waters, hundreds of little dories, mere baubles that climb the waves and shoot down the olive depths, brave the gale, one man in the bow, handling the line, another in the waist, with oar to keep the bow to the combers and knocking off the frozen spray lest it sink them. May it be long years before the steam trawlers, with their wasteful destruction of sea life, drive their brave craft from our coast!

Fishing in every clime and under all conditions has its dangers which it takes true men to face. The swordfisher, aloft in his nest, the trawler, matching his skill against the waves, feels a spiritual exaltation in his work that he who is at the call of a whistle can rarely know. Such a life gives a touch of nobility to character, it makes men teachable and of a humble spirit because they constantly face the mysteries of creation, and it makes them independent and passionately fond of freedom. It was not by luck that He who read character aright chose His disciples.

Our Southern Highlanders

SOME four hundred mountain girls and boys who seek an education, but are unable to pay for it, have made applications to the Lincoln Memorial University of Cumberland Gap, Tennessee. This university has about 900 students consisting of boys and girls who come from the Appalachian Mountains in the Carolinas, Virginia, Tennessee, and Kentucky. Many of them are from log cabin homes situated in the remote valleys of the southern mountains. In that region there are hundreds of families out of touch with the outer world, descendants of sturdy Scotch-Irish stock who came to America early in the eighteenth century, settling in Pennsylvania and later going into the Appalachians. Few people know that this is the purest American stock in the United States. Dr. Matthews, president of Lincoln Memorial University, states their influence on the United States Constitution was very marked. They were the first people to stand for representative government on this continent. Some of the more hardy penetrated the wilderness in the early part of the eighteenth century as far as what is now Boonesboro, Kentucky, where they established a representative government with the object of founding an independent republic. It is remarkable how these people have retained their original Scotch-Irish strain, not mixing with other nationalities, and still retaining their ancestral traditions. It was from this stock that Abraham Lincoln came.

Wonder Voyage to Religion's Cradle

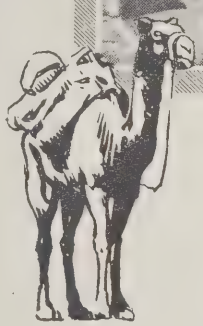
Syria, the Land Where the Lovely Zenobia Ruled as Queen

By HAL WALKER

TWENTY-EIGHT centuries before the Christian Era, Syria was inhabited by the Armenians, Hebrews, Canaanites, Arabs and Bedouins, and by the Hittites of the north and the Philistines of the south. It was the commercial route as well as the strategic thoroughfare between Asia Minor, Mesopotamia and Arabia, the battleground of Hittites, Babylonians, Assyrians and Egyptians, the Egyptians dominating the country from the sixteenth to the twelfth century before Christ.

Then came various changes during the centuries until Rome took a hand, with the result that Syria was a Roman province for a time and Zenobia, Queen of Palmyra, was defeated by the Emperor Aurelian and taken, bound in golden chains, to Rome as a captive. There was later the Byzantine control and then, in A. D. 636, Syria submitted to Arab control under the Khalif Omar II.

With this short review of the centuries I looked from the deck of the *Pierre Loti* for the first time on Beyrouth as the liner slowly made her way inside a modern breakwater and came to anchor with a score of other vessels. On the quay side were a number of high-priced touring cars ready to whirl us through the city itself, then on to the mountains and desert, to Damascus, Aleppo, and Baalbek, and the clang of street-car gongs could be heard even out on the bay as twentieth-century electric transport carried the people of this ancient city about their daily business. Truly a far cry from the days when the folk of 5,000 years ago came down to the shores of the Mediterranean from the mountains and deserts back of the sea.



Above—Clock tower, Beyrouth.
Below—Beyrouth, Syria.

French influence in Syria had its inception in the time of Charlemagne but it was not until 1535 that the capitulations were signed by François the First and Sultan Suleiman which guaranteed the rights of French nationals in law, religion and commerce. These capitulations gave French ambassadors the right to intervene on behalf of subjects of France or of Christian friends of France, and they have had a strong influence in the relations between France and Turkey for centuries.

Economically, French influence in Syria may be said to have commenced in 1685, from which time until 1835 the Chamber of Commerce of Marseilles was associated in the administration of commerce in the Levant, being charged with verification of the papers of French who resided in Syria as well as charged with verifying bills of merchandise sent there. The Chamber of Commerce of Lyons was less active but a participant in this control. In 1910 the Marseilles organization created a bureau for inspecting and classifying the various grades of wool, the chief export of Syria.

France received the mandate for Syria and Lebanon at the Allied Conference of San Remo, following the inquiry made by the American Commissions shortly after the Armistice, which decided in favor of France. Even before the war there were 500 French schools in the country with more than 50,000 pupils as well as a number of hospitals. The port of Beyrouth was built by the French and is the only modern port north of Port Said, while the railroad development, though not great, is practically wholly French.

General Gouraud, as high commissioner and commander-in-chief of the French army in the Levant, arrived at Beyrouth November 21, 1919, and from later observation throughout the country his work has been of the highest order. He opened roads where roads had never been before, established more schools, promised a square deal to everyone, secured the submission of the Alouites in the mountains who had never before acknowledged foreign domination, and put down the Feisal insurrection in short order. After years as an administrator in Morocco, followed by his heroic service in the World War in which he was wounded five times and lost an arm, and where he commanded American forces in the Argonne, General Gouraud had nearly four years in Syria, completed his task, and is now Military Governor of Paris, one of the most sought after billets in the service.

It was stiflingly hot along the waterfront at Beyrouth; in fact, it is hot in Syria most of the time except two months during the winter when people suffer with the cold as they have no means of warming their houses. There is no coal in the country, very little wood and stoves are almost unknown except for cooking purposes, and then only in the large towns. We were whirled out to the new quarantine station and back to the Bourse where the most interesting sight is the money-changers. Many contracts in Beyrouth, especially leases for houses or stores, specify payment must be made in gold piasters, and this means little ally "gold." No paper money promising to pay in gold is accepted, so there are a score of money-changers busy

during business hours giving out gold coin and taking in paper. The majority of the customers are barefoot Arabs or Syrians who tie their gold up in an old handkerchief and stalk on out about their business.

At a reception in the local club within two hours from the time we set foot in Beyrouth we heard the first note of discord with the French régime, and this was from Frenchmen themselves. Several men tried to speak at once and tell their grievances to the visiting delegation. The main, and really only, point was that they, as French subjects and citizens, were not getting a fair deal in business. For one thing they objected to a general customs duty of 11 per cent which was applied to products of all countries alike, and then they wanted special consideration for themselves in business and taxation. It was the same condition that Mr. Taft had in the Philippines many years ago when he was governor-general there, and to which he made an answer in a Fourth of July speech at Ilcilo which caused the bitterness against him in the islands. Taft at that time said, in effect, "If you don't like the way the government is running things here you can get out. We are running these islands for the benefit to the Filipinos." I imagine that would be the substance of a remark by General Gouraud on the same subject in Syria, but probably couched in slightly different phrasing.

Kaleidoscopic Scenes in Syria

From the time of landing in Syria the mission was fêted and banqueted and rushed from one end of the country to the other, getting a somewhat kaleidoscopic impression of so many different scenes, changing people and customs, but accomplishing more, even in the sight-seeing line alone, than could a regular tourist in three times the period we spent. We were in a topsy-turvy world from the standpoint of Western civilization, which was brought home to us at our first banquet, or rather luncheon, served at Beyrouth in an excellent club. With the exception of a few French resident officials, civil and military, those whom we met were Syrians and Arabs, nearly all Moslems, and the mark of the highest respect in Eastern culture is not to remove the hat, or rather fez, in the presence of a guest.

We had at least one state luncheon or dinner a day during the more than two weeks we were in Syria and this sitting down to the table with the majority of the company covered soon grew to be commonplace. The Eastern woman does not go to public affairs such as were ours. Two members of the mission had brought their wives along and they were the only women ever present at the luncheons or dinners where native officials and business men gathered. Even when affairs of this kind were given by French resident officers at different places, their own wives were never present, but appeared later for the dancing if there was any. The French are very particular in following the social practices of the people they control in other countries, and this makes for efficiency in administration.

Among the Mountains

Almost immediately behind Beyrouth rises the first chain of mountains and here, twelve kilometers from the center of the port, is the summer colony where everyone of any importance lives for considerably more than half of each year. It is a stiff climb for an automobile but the roads are good and we reached this summer place, Aley, late in the afternoon and were welcomed by General Gouraud at his summer residence. Then we proceeded to a large public garden nearby for tea as the guest of Habib Pasha, president of the council of Greater Lebanon.

Following tea we started for Sofar, eighteen kilometers farther into the mountains, and there at the Grand Hotel de Sofar, which really merits its name in this country, spent the night after our first real banquet as the guests of General Gouraud. The relief from the heat at sea level was welcome and here, 3,600 feet above the sea, the vegetation was far from tropical. Both the soil and the pines and other evergreens reminded me of the Philippine summer capital, Baguio.

It was early the next morning that we really started our great adventure—to Damascus which we should reach in the evening. Next to Bagdad, for my part and for everyone with whom I ever discussed the matter, Damascus holds out more lure to the stranger than does any other of the mysterious cities of the East. It can be reached by train from Beyrouth but the most interesting way to reach it, a way which will linger as long as life itself, is by motor along the old caravan trail.

Damascus Silk Culture

One of the principal reasons of the mission's trip to Syria was to investigate the development initiated by the French and to study further possibilities of commerce between Syria and France, so we visited every French undertaking. Leaving Sofar at seven o'clock on the day in which we were to sleep in Damascus, we made a stay of an hour or more at the establishment of a Lyons silk firm which raises its raw material here in Syria. Everyone knows, I suppose, that Lyons is the great manufactory in France for silk and that its raw material comes from abroad.

I have seen something of silk culture in Japan, but never shall I see feminine beauty draped in luxurious silk again without having flashed before my mind's eye the picture of wee kiddies standing on their feet five hours every morning, softening the cocoons in hot water while the stench of the dead insects inside made the air anything but inviting. We had been through the shipping and packing rooms where the cocoons which are shipped direct to Lyons are packed, and finally were taken to the building below the hill where cocoons were softened and unraveled.

Here were long troughs into which the cocoons were dumped, a dozen or so at a time, and these Syrian girls stirred them around in the scalding water until the soft fibers could be unraveled, when they were wound rapidly on bobbins, enough of the filmy stuff twisted together to make a sizable thread. There these little girls, some not over eight or nine years old, were made to stand before those steaming troughs all the forenoon, five hours, and a big Syrian with a switch passed continually up and down the aisle behind them ready to switch their bare legs if they tried to sit down or otherwise rest. These tots, really, received two francs a day for the less skillful work of softening the cocoons, while the larger girls, none more than fifteen, who were skillful in unraveling the fibers and winding them on the spools or bobbins, received seven and eight francs.

The Orphan Girls

The larger girls worked all day, however, while the smaller ones went to a school conducted by a religious, where they had four hours in the classroom in the afternoon. All these girls were orphans, and although their ordinary wants were taken care of, they had a larged dormitory and were looked after by the religious, I could not see where they had any playtime.

Out of the silk area we went over the mountains of Lebanon along the caravan route toward Damascus, meeting or passing long strings of camels every few minutes. These caravans, coming down to the sea, are loaded with grain from the rich plains of the interior, and back to Damascus they carry all sorts of goods from the outside world. I noticed that the greater part of the caravans bound into the interior were loaded with cases of kerosene with the familiar stenciling of a well-known company on the outside. I had always supposed that camel drivers rode a camel or walked, but all these caravans were led by men riding a diminutive donkey, with a lead rope to the first camel.

Late in the morning we came down from the mountains into the plain and stopped at the meteorological

station of French fathers set in the midst of rich acres at Ksara. A few hundred yards from the main road were the observatory, irrigation plant, and a radio station which gave us the latest news from the outside world, all in a perfect setting of agricultural beauty with the mountains in the distance. Except for the camels passing it might have been California.

Through more rich valley we traveled after leaving the observatory to the domain of the Jesuit fathers at Tanail where they have operated for many decades. "The Cross and the Plough," the motto of the Jesuits, has borne fruit in this distant valley of Syria. The fathers had prepared a display of their fruits and vegetables for us, and never have I seen such a varied collection of excellent products of the soil as was there shown. There were apples, pears, peaches and plums, grapes of a dozen varieties, some as large as a man's thumb and of the most delicious flavor, cabbages, potatoes, radishes, squashes, pumpkins, carrots, corn, oranges and lemons, all of the first quality and which would do credit to any painstaking gardener in any clime. After seeing this display we sat down to the regular fare of these priestly farmers in the bare room which is their dining hall and ate to repletion of the good things they raise on their land.

Being satisfied internally, again we crept into the motors and sped over desolate waste nearly all the afternoon. We stopped on the battleground where Emir Feisal was finally defeated by the French on July 24, 1920, after Feisal had been attacking outposts for several months, encouraged, the French always claimed, by the British in Palestine. Colonel Goudot, chief of staff of the French army in the Levant, who was present at the battle, described it to us.

Following the battlefield visit, which was on the main route to Damascus and on a rocky height called Kahn Meiseloun, we rushed along for hours over more desert country and just as dusk was enshrouding the desert we dropped into Damascus, with all the appurtenances of modern civilization.

The Old Oaken Bucket

By HOMER KINGSLEY

You ought to know something about this picture. But, perhaps you haven't heard the old song! There are so many jazz records, popular ditties, crashing military bands and wonderful grand operas that most folks have forgotten this one.

This scene inspired Samuel Woodworth to write "The Old Oaken Bucket." There is a human interest story connected with the writing of this familiar old home song, that is rather disconcerting to the idea of the song itself. It is not often related or even known.

It seems that Samuel Woodworth and his friends were all having a glass or two—or three. One of the bunch suggested that each give a toast to something that was a pleasant memory. Mr. Woodworth responded with a toast to the old well and the bucket. Everyone present liked the toast so well that he wrote it out in the form of a song from an outline that he had traced on a spare piece of paper.

The well is still preserved over in Greenbush, Massachusetts. The occupants of the house will gladly show you the well with the long pole and an old moss-covered bucket attached. It looks as if it might be the identical one mentioned by Mr. Woodworth.

We might make some alleged funny remarks about the writing of the song under the conditions—but we won't.

This is the actual scene that was in the mind of the man who wrote "The Old Oaken Bucket." Samuel Woodworth responded with a toast about the most pleasant memory with a glass in his hand that did not contain water, however.

What Makes Humor Humorous

(*Concluded from page 7*)

but the work done is steadily growing better. In particular, burlesque has advanced to the footlights, and while much of it is vulgar a great deal of it is extremely beneficial. Donald Ogden Stewart and George Chappell have both made notable contributions to burlesque. Mr. Stewart, in his "Perfect Behavior" and in his burlesque history of Mankind revealed a formidable talent. We have not yet, however, succeeded in satirizing ourselves as skillfully or as powerfully as the thing is being done in England by writers like May Sinclair, Rebecca West, Philip Gibbs, John Galsworthy, Bernard Shaw, and indeed Bvoe and Lucas of *Punch*, not to mention A. A. Milne. The reason for this lies almost exclusively in dialog. One can scarcely read May Sinclair's dialog in her "Cure for Souls" without realizing that we rarely reach this level of satire.

We may say of good dialog that it is human character in fluid form. Dickens created and threw off his inimitable characters with a reckless profusion which must ever astound us. We may criticize them all we please, but there they are to be laughed at, and cried over in our crassly sentimental moods. But upon examination, we shall see that it is upon their dialog they chiefly depend for their individualization. The English dialog in its best form is a delight, whereas the American dialog is too often artificial. This is due doubtless to our own scattered aspects, to our lack of racial cohesion.

One of our most popular humorists told me that he attributed his success to the fact that he listened. He reproduced the talk of the lower Middle West—if such an expression is permissible—and as such it is easily recognizable. Booth Tarkington has also been very happy in his skill at hitting off the accents of the seventeen-year-old American, and there are great touches in Edna Ferber's "So Big."

We are undoubtedly improving in this important art, but we have still much to learn. In even a cursory reading of our contemporary fiction and essays, one may easily discern when there is a sense of humor present and when there is not. Humor runs like a gulf stream through our wide expanse of sentimentality. Dickens was able to bring these two things together, but we keep them apart. Readers of all nationalities appreciate a touch of humor in almost anything they read, although the particular brand which appeals to them might not be appreciated everywhere. The appeal of Dickens was universal. Our Harold Bell Wrights and Gene Stratton Porters are not on speaking terms typographically with our Donald Ogden Stewarts and our Dorothy Parkers.

City People Still Love Flowers

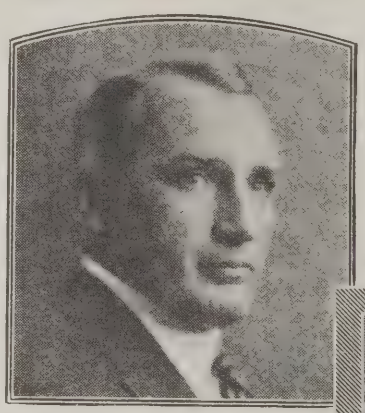
When the Wealth of Woodland and Garden Is Lavishly Displayed

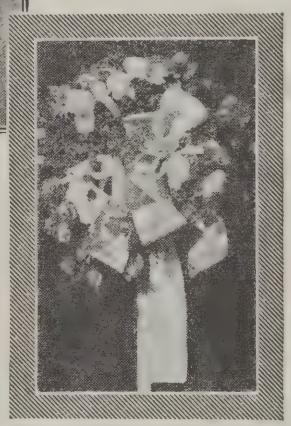
By ALBERT SIDNEY GREGG

A. D. TAYLOR, of Cleveland, a distinguished landscape architect and designer of cities, was the guiding genius of the flower show recently held in Cleveland.

"Now that it is all over, what is your outstanding conclusion?" Mr. Taylor was asked on the closing day. "Was it worth while?"

"Decidedly yes," was his emphatic reply. "It was a great and lasting demonstration that city people still love flowers. Hundreds came back during the week for a second tour through the exposition. The great success of this show satisfies me that the love of beauty in nature is growing among city people, in place of being stifled by material competitions."





A.D. TAYLOR, first vice-president of the exhibition, who was largely responsible for its success.

Right—Matron of Honor bouquet.

For nine days, beginning March 28 and closing April 5, from 10 o'clock in the morning until 10 o'clock at night, a great stream of flower lovers surged through the immense floral exposition staged in the Cleveland Public Auditorium by florists of Ohio and adjoining states. The auditorium where the show was held is said to be the finest building of the kind in the United States. It is a mammoth affair costing $6,500,000. It is 300 feet long by 215 wide inside, with an arched roof in a single span 80 feet from the floor, and will seat 12,500 persons. It has housed the Republican Convention, the "Miracle Play," and the performances by numerous international celebrities. For exhibition purposes it will provide 70,000 square feet of floor space, and all of this space was required for the floral exhibits.

The exposition was a gorgeous spectacle of color, quality, and artistic arrangement, designed to reveal the advancement made in floriculture, landscape architecture and the growing of flowers by professionals and amateurs in Ohio, Indiana, Michigan, Illinois, Western New York, and Western Pennsylvania. Flowers, plants, trees, shrubs, and garden equipment valued at $500,000 were used in putting on the show. The attendance was 125,000. In many respects it was a greater event than the National Flower Show which was held in the same auditorium a year ago, and ranks as the largest affair of the kind ever held.

There were twenty complete gardens, with fountains, pools, cascades, fences, flowers, sod, statues, and shrubs. More than two hundred model houses of all styles were used in the demonstrations.

Nineteen classes of plants were exhibited, including bulbs, begonias, cacti, coleus, geranium, amaryllis, ferns, fuchsias, palms, umbrella plants, roses, azaleas, tulips, daffodils, and a royal display of orchids and thousands of brilliant cut-flowers. Cleveland school boys showed what they could do as amateur florists by carrying off a prize for their exhibit in competition with professionals. Collections of new and rare plants were loaned by the United States Botanical Gardens, Bureau of Plant Industry and Bureau of Plant Introduction at Washington, D. C. The University of Michigan, University of Minnesota, and Iowa College entered several models depicting proper planting of home lots.

Mrs. Fred Klingbiel, of Port Clinton, Ohio, exhibited her famous "Devil's Lily," which is twelve years old. The blossom and stem of this plant are more than six feet high, and the bulb is eighteen inches wide. The color is maroon with black spots.

"Venus flytrap," a natural fly-catcher, was another plant curiosity on exhibition. In this group of curios was "The Mother-in-Law Plant," from the United States Botanical Gardens. Natives of Central and South America say that the juice of this plant will still the most violent tongue for one week.

An 800-pound marble statue of "Diana," by Anna Hyatt Huntington, was loaned by a New York gallery, and used in the central garden exhibit of azaleas. Shrubs and a cascade, high in north gallery, were arranged by Park Commissioner Sam Newman and City Forester A. L. Munson, of Cleveland. This display won a gold medal and a prize of $200 on points. "Springtime," a statue by Mrs. Edith Barrett Stevens Parsons, was among the ornamental pieces.

A feature was made of an exhibit of fish, among the entries being goldfish, tropical, Siamese fighters, calico, veil tail, sword tails, lionheads, climbing perch, Brazilian half-moons, Chinese walking fish, and a black fellow dubbed "Pittsburgh" by one of the visitors because his color resembled coal smoke.

The prize exhibits were arranged in the main arena of the auditorium where they were tied together in such a way that they formed one vast garden. The entire floor just below, the same size as the arena, was occupied by retail sections and special exhibits. The "Castle of the King of Gardenia" filled the spacious stage, and was fronted and flanked by a garden of striking colors and design set off with winding gravel paths and lily ponds.

Twice a day visitors were required to take seats in the galleries, to make room on the main floor for the ballet pantomime, "Victory of the Rose," in which seventy girls participated. The performers issued from the "Castle of Gardenia" and returned to the castle after going through their evolutions. Lectures by eminent speakers, germane to the purposes of the exposition, were also given afternoon and evening in a side hall. Music was furnished by an orchestra and the auditorium pipe organ. At night multicolored lights played over the exhibits and the visitors.

The flower show was sponsored by a group of Cleveland people who will not be required to make a deficit, because the show "broke even" financially. Five weeks before the exhibit was ready "money saving" tickets of admission were offered at fifty cents each in flower and seed stores, lodges, drug stores, and in a chain of grocery stores, resulting in an advance sale aggregating $30,000—more than enough to take care of the prizes offered. At the gate the admission was 75 cents for adults and 25 cents for children. School children from the fifth to the ninth grades were admitted free in the forenoons when accompanied by their teachers.

Officers in direct charge were Francis E. Drury, president; A. D. Taylor, first vice-president; Mrs. John Sherwin, second vice-president; Robert P. Brydon, third vice-president; Herman P. Noble, secretary-treasurer; L. C. Vinson, executive secretary; and Harry B. Jones, chairman for the 1925 Flower Show. Eighty committeemen managed the details.

Responsibility for the exposition rested largely upon A. D. Taylor, the first vice-president.

Stage and partial view of the arena floor, showing the castle of the King of Gardenia.

A wayside garden.

Rustic stone flags.

A unique beauty spot.

Statue of Diana graced this lovely display.

THE LIBRARY OF THE

URBANA ILL

Thus I consent, Sir, to this Constitution, because I expect no better, and because I am not sure that it is not the best. The opinions I have had of its *errors* I sacrifice to the public good. I have never whispered a syllable of them abroad. Within these walls they were born, and here they shall die .... Much of the strength and efficiency of any government, in procuring and securing happiness to the people, depends on *opinion,* on the general opinion of the goodness of that government, as well as of the wisdom and integrity of its governors. I hope, therefore, for our own sakes, as a part of the people, and for the sake of our posterity, that we shall act heartily and unanimously in recommending this Constitution, wherever our Influence may extend, and turn our future thoughts and endeavors to the means of having it *well administered.*

—Benjamin Franklin.

CHRONICLER OF THE NEGLECTED TRUTH

BRIEFLY TOLD

M. Lautal, of Marseilles, France, has a model apiary where he treats rheumatics and people suffering from gout, lupus, eczema, and epithelioma by having them stung every day until fully cured.

In the eighties, tigers had become so dangerous in Java that the natives in the Bantam district were unable to hold their own against them, and fled to an island off the coast for security.

Every year, more men and women come out of prison in the United States than graduate from all our colleges and universities.

Potato flowers rarely set true fruit inclosing seed, because nearly all potatoes are female. Good potato pollen, capable of fertilizing flowers, is very rare.

Charles Dickens was christened Charles John Huffam Dickens.

Oscar Saxe, a Belgian, invented the saxophone ninety years ago. The original saxophone is still in existence.

White foxes are being successfully propagated in Alaska.

Ts'ai-lun, of China, a member of the court of the Han dynasty, A. D. 75, produced the first hand sheet of paper ever made. It was constructed from the bark of a mulberry tree.

Special rubber insulated gloves and sleeves are now made for the purpose of protecting electrical workers from shock.

A small crockery savings bank containing coins, presumably placed there by a child 2,500 years ago, was recently excavated at Utica, Tunis.

Before the days of the newspaper in England, the king's herald and the town crier gave the news deemed essential for the people to know.

Japan, being the land of cherry blossoms, celebrates each April with the Geisha cherry dance.

The highest honor in the French literary world is to attain a chair in the French Academy.

The wheelbarrow in China is a common vehicle for transporting people. As many as eight persons are often seen riding together, being pushed by a single coolie.

The Earl of Danby in 1676 unsuccessfully attempted to suppress English coffeehouses on the grounds that they were centers of political agitation.

The interiors of temples of Buddha in Japan are to be opened to the motion picture camera where the lives of the priests and the religious ceremonies will be filmed as an aid to missionary work.

Mrs. Jeanette Hyde has been named collector of customs for Hawaii.

The viking's burial was impressive. A ship filled with inflammable material was set afloat with the body laid amid the corpses of his slaves, whose souls would serve him in the next world; while his favorite charger lay at his feet. The material was then set on fire, and floated burning out to sea.

European banks are using airplanes for long-distance transfers of their gold.

On the upper reaches of the Yangtze River are mountain caves inhabited by Nashi shepherds and guarded by mastiffs. The shepherds are shy and flee when the traveler approaches.

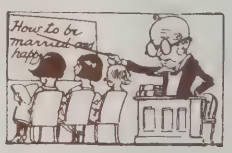
Only 35 per cent of bread is homemade where formerly 70 per cent was homemade.

The European fowl pest which has caused such great damage to flocks was introduced into the United States in 1923 by a scientific investigator who let the virus "get away from him."

The adoption of the Declaration of Independence was first recorded in a Philadelphia paper ten days afterward, and in a Boston paper twenty-two days afterward.

Constant exposure to gasoline fumes is one of the apparent causes of cancer, according to physicians who have studied and specialized in this disease.

The persistent dandelion grows on mountains that rise to a height of 14,500 feet.



Forty girls are taking the new course in matrimony at Boston University, which teaches that marriage develops many problems, most of which can be analyzed and solved beforehand.

The chough, a bird of the barren Himalayan Mountains, can sometimes be seen sitting on the wild sheep's back searching for insects in the animal's hair.

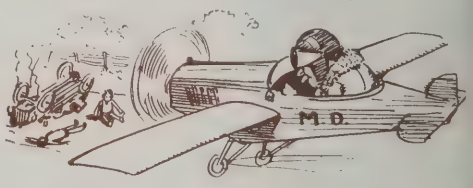
There being no conductors aboard Japanese trains, stations are not announced, so the traveler must watch for the name of his station.

Missouri clay, used as a substitute for German clay in glass pot manufacture during the war, has been found quite as good as the German product.

The scientific committee of the Large Black Pig Society of England is offering prizes to anyone who can present an effective inking scheme for permanently tattooing black pigs.

For the first time in 100 years, snow was seen on Mt. Vesuvius this spring.

An airplane for use in emergency cases in the rural districts has been purchased by Dr. Herman J. Neubauer, of Hinkley, Illinois, who will engage a pilot until he is able to handle the machine himself.



This Issue

Mr. Ford's page discusses the tendency of groups, formed to maintain certain principles, who get sidetracked on other issues. (p. 11)

Jack London is a name which appeals to every reader of fiction. At his death some of his literary work was left unfinished. His widow has undertaken the completion of the structure which he had not completed. She tells the story of this, and gives intimate glimpses of Jack's" life and work. (p. 2)

This is an article which will interest everyone. In it Allan L. Benson has some conversation about what he calls legalized larceny." It involves the question: "Should not Congress stop taxing and wasting?" (p. 3)

Montreal is in a peculiar position in regard to its schools. It has a dual school system—Catholic and Protestant—but there is no constitutional provision made for the education of the Jews. Through this a situation has arisen which is fully explained. (p. 4)

You may not think much about your friend the toad; but if you read this entertaining article you will see just how much good food he saves for you through the war he carries on against insect pests. (p. 5)

Did you ever read about Diogenes? He was a very eccentric but very likable old man who lived many centuries ago. He might be called the Charley Chaplin of his age, but whereas Diogenes was a great philosopher with a sense of humor, the modern comedian might be designated a great humorist with a sense of philosophy. (p. 6)

Just what it means to this country is discussed in a talk about Britain's return to the gold standard. (p. 8)

Books! Books! Books! Browsing among the old bookstores of London is one of the greatest delights of literary men in the great metropolis. One who himself is an ardent book-lover tells the reader all about it. (p. 12)

There are millions of dollars of state bonds which cannot be collected. You will learn the reason why in this highly illuminative statement. (p. 14)

Thomas St. Germain was one of the most romantic of the "Romantic Rascals"—and one of the cleverest and most elusive. Charles J. Finger in his fascinating style tells you all about him. (p. 16)

Completing the House That Jack Built

By LOUIS ALLEN

Photo from Louis Allen.

An unconventional snapshot of Jack London. Right—An early portrait.

DICKENS died with "Edwin Drood" well under way; Stevenson passed on with "Hermiston" less than half-finished, and Jack London laid down his pen in the middle of a novel of Japan. "Edwin Drood" and "Hermiston" remain mere fragments, in the case of "Hermiston" a glorious one certainly. Jack London's last novel will not remain a fragment, thanks to the versatility of his widow, Charmian London.

To meet this able woman, who already has literary successes to her credit, I left San Francisco for Glen Ellen, in the Valley of the Moon, 60 miles north, just before the winter's rains set in. About two miles west of Glen Ellen, a somnolent little village hugging Sonoma Creek, I came upon the Jack London ranch, the 1,400-acre home of Charmian London, spreading well up on the flank of hulking Sonoma.

Although deep in the work of writing the last half of "Eyes of Asia," Mrs. London graciously welcomed the interruption. Still the same vivacious, supremely alive personality as in the days of the *Snark* voyage, Charmian London has changed little. More serious perhaps, more matured surely, but otherwise the same Charmian who for more than a decade was a partner in the great adventure of one of America's most unique men.

"No interviewing nor picture taking just yet," my hostess advised smilingly. "Let's chat a while first." So we talked of her recent European trip, of her work, her plans. As we talked we browsed through the museum-like halls and rooms hung heavily with souvenirs of the South Seas and the round-the-Horn voyages. The workshop, almost exactly as Jack left it, is still Mrs. London's work place. On the walls hang original paintings and drawings, many of them used in illustrating Jack's books. Anton Otto Fischer's virile canvases predominate. Perhaps most interesting of all the pictures is James Montgomery Flagg's original caricature of Jack London as a sailor. Evidently Charmian was intrigued by this pen-and-ink drawing. "There's something very remarkable about that sketch," she explained. "It was a favorite of Jack's. The artist drew better than he knew, for the eyes are the eyes of Jack's mother."

Everywhere mementoes, particularly of the South Seas. Photographs and paintings of the *Snark*, photographs of Jack and Charmian in a score of lands, on horseback, in swimming, in Hawaii, Samoa, Australia. For Jack not only loved to be "shot" by his camera friends, but was himself an extremely proficient amateur photographer.

Then came the sleeping porch where Jack slept his last. On the wall at the head of his bed still hangs a painting of the *Snark* and the little yawl's brass bell. At the side of the porch where he could reach it without getting out of bed is the cardboard dial with indicator still pointing to the hour of 8. Thus Jack indicated to hi Japanese servant when to wake hin But Jack London went into the lon sleep that night. In the morning h could not be awakened. Despit heroic efforts to overcome the uremi coma into which the author had lapsed he never regained consciousness excep possibly one supreme moment whe Charmian roused fleeting recognitio in her mate's eyes. So, at forty passed one of the world's most inter esting figures.

Back in the workshop Charmia showed me an English newspape clipping just received which state that the Prince of Wales is especiall fond of Jack London, and was intro duced to his books by David Lloy George.

A complete set of Jack's work occupying more than a five-foot shel prompted the question of writin methods. Such prodigious output fro one who died at forty indicated syste matic and sustained effort.

"There was a sort of routine, a regarded working hours and meal time, and the working hours were th same for Jack whether we were hom or traveling. He was awakened a six by his Japanese boy with coffe

When Jack was awake, he wa thoroughly awake—no yawning an stretching; just a little preparator cough, a lunge over on his side towar the bedside table where lay his book and note tablets and empty thermo bottles, whose contents had been drun while he read in the night either befor he slept or when he happened to wak Oh, no—never alcohol, but water, c tea, or buttermilk. He often said h could consume more liquid tha any man he knew! Sometimes h added that it was luck he liked wet things, be cause it was good fo him to perspire—h smoked so continuously

"At seven, still read ing, he ate breakfast i bed—eggs and toast an coffee, and always frui of some sort. He like things prepared so tha he need not waste time— say peeling apples o oranges or bananas. H was jealous of every save moment for reading o talking—loathed un profitable activity. A a matter of fact he ha had too much of that i his younger days. Fo lowing this idea, whe he was ready to get up

Should Not Congress Stop Wasting?

Why Not Write Letters to Your Local Newspapers?

By ALLAN L. BENSON

THIS will interest you because you have use for the things that money can buy. As a sensible person, you know you can buy nothing with the money that has been taken away from you against your will and spent by somebody else.

Let us have, then, a few moments of pleasant conversation about legalized larceny. Our President furnishes the text in these words:

"The collection of any taxes that are not absolutely required, which do not, beyond reasonable doubt, contribute to the public welfare, is only a species of legalized larceny."

Accepting the President's definition of the act, how many legal larcenists have we in this country?

How Many Legal Larcenists?

First, we have the United States Government, which, upon the authority of the President, is still carrying on its pay rolls employes that it does not need and annually wasting millions that the people earned for themselves but were not permitted to keep.

Second, we have forty-eight states, each of which is a legalized larcenist because it is collecting taxes that it does not need and wasting the difference between necessity and extravagance.

Third, we have not fewer than a hundred cities in each of which there is more legalized larceny, in proportion to population, than there is in the National Government or in any state government. If you want to get skinned, and get skinned right, live in a city. If you own property they will get you when you pay your taxes. If you don't, they will get you every time you buy a thing at a store. The merchant, having been stung at the tax-collector's window, shifts the legalized larceny to you when he marks the prices on his goods.

In short, government in the United States—national, state, and municipal—has become oppressive. That is a strange word to use to Americans. We learned in school that oppressive governments were elsewhere. What we learned was true. The burdens of our government were light.

We must revise our histories, however, if we are to teach the present truth. We are taxed as no people were taxed prior to the Great War. The war has ceased, but the reign of extravagance that it produced is still with us. Mr. Coolidge, in his Inaugural Address, said that "We no longer need war-time revenues," but our politicians will not care what we need unless we make them care.

Government cannot be kept good by patting it on the back and telling it how good it is. Always the thing to do is to shake it up and tell it how bad it is. Jefferson, who possibly knew more about democracy than any other of our Revolutionary forefathers, recognized this. When he was not in office, he was always a pretty savage critic of government himself. He went even so far as to appraise the corrective value of a threat of revolution. Jefferson knew the history of republics. He knew how they always started out well and ended in the junk heap. He knew the tendency of organized government to centralize and to usurp power, and gradually to gain the idea that it was greater than the people.

What Jefferson knew we should not forget. Mr. Coolidge's words about legalized larceny should help us to remember. There is a lot of dynamite in those words if you search out their plainly implied meanings. The first fact that they recall to your mind is that it is not your business to stand for legalized larceny, even if it be your national, state, or municipal government that inflicts it upon you. The moment your mind bursts out of this window, you are in the open air where you can think some more. You begin to see your relationship to government in the old terms in which Americans have always perceived it. You see how much the American definition differs from the Continental European definition—particularly the old German concept. The old German idea was that the people existed for the convenience of the state. The people existed so the Kaiser would have soldiers when he needed them and workers to produce revenues for the government. The people were at the bottom, the government on top.

Do We Have the Old German Idea?

That is exactly the wrong way to look at this matter. Government is but a contrivance to enable people to do for themselves collectively what they could not do individually. In other words, government is at once a method and a tool. There is nothing sacred about methods and tools. If methods are turned against us and tools are used to blow our safes, it is our business to yell murder and stop the robbery.

We used to know that, but we are forgetting it. It is strange to what an extent the old German idea of subserviency to the state has crept into some American minds. Our institutions are only as great as we make them and keep them. Just now, some of them are in need of a little polishing.

It is not the fault of our government that it is yielding to the tendencies that destroyed earlier republics. It is apparently in the nature of man to work a graft to death when he gets it, wherefore republics have heretofore eventually gone the way of other governments that became intolerable. But it is the duty of citizens of a republic to tell the gentlemen who hold their offices where to get off. Gentlemen who have the power to spend public funds and impose taxes should be made to feel that storms will break loose in their constituencies if they spend more and tax more than is necessary.

Some of our politicians have not caught this idea at all and none of them has caught enough of it. Under the lashing of the President, Congress has made a beginning at the reduction of income taxes, but the states are still running wild and city officials have yet to hear that there is any demand for economy at all. Everybody talks about high municipal taxation but nobody does anything about it.

In focusing public opinion upon our public officials, we should begin in Washington and go down through all the state capitals and our chief cities. We should make Washington understand that we want the income tax not only reduced but ultimately and speedily abolished. The income tax is too easy a way to get money out of people. Congress simply fixes the rate of taxation and the victims must pay. No government should ever be permitted to feel that it has but to say the word and as many hundreds of millions as it wishes to waste will be forthcoming. Government, to be good, must be kept decently poor. The public officials who spend other people's money must feel that money is hard to get. There is no other way of compelling governments to be economical. There is so much that a politician can do for himself by helping his friends to dip into the public till.

Washington Should Understand

Moreover, if we wish our politicians to treat public funds as a public trust and be economical in their expenditure, we must ourselves so treat them. We must not howl about high taxation one moment and in the next breath try to grab. I make it a rule to vote against every Congressman from the district in which I live who tries to get a Federal building for its chief city. The city can wait until times are more favorable. Nor can I stand the unseemly greed that comes to the surface every time the subject comes up. Who headed the committee that went to Washington to see the President about the matter last winter? No (Concluded on page 27)

The Montreal School Problem

A Dual School System Provided by Law, But What of the Jews?

By R. HOLMES PARSON

THE Jewish school population of Montreal has grown from 269 children in 1890 to more than 13,900 in the last school year. They thus comprise at the present moment over 40 per cent of the scholars attending the Protestant schools of the city. The amount which the Jewish property owners contribute in taxes to the education of their children is under 20 per cent of the total expended. This in a nutshell is the situation existing in the city of Montreal, and the adjustment of it has created not only bitter controversy, between Jews and Protestants, but has involved the Provincial legislature, has caused questions to be submitted to the Court of Appeals, and has opened the prospect of further legal action before the Supreme Court and, likely, the Privy Council in London.

The Jewish question in Montreal has existed since 1886 when, in consequence of a disagreement among the Jewish synagogues, some of them withdrew their tax contributions from the Protestant panel and gave it to the Catholic panel, who forthwith returned 80 per cent of it to them for the support of a voluntary school of their own. The result was that in subsequent years the Protestants were educating 80 per cent of the Jewish children but were receiving only 20 per cent of the Jewish taxes. Subsequent to 1890 harmony was restored among the synagogues, and they undertook to pay their taxes into the Protestant panel and closed their own separate school.

How Costs Are Distributed

In the scholastic year 1900-1 the number of Jewish pupils had risen to 1,153, representing a cost of $34,451.64, and as the total of Jewish taxes amounted only to $11,016.24 the Protestant taxpayers had to contribute $23,435.40, in addition to paying for the education of their own children. By 1902 the number of Jews had increased to 1,775, out of a total of 9,128 pupils attending the Protestant schools, and although the Jews had the right to send their children to either the Catholic or the Protestant schools, and had also the right of option whether they would pay under the Catholic or Protestant school tax, the Jews chose to pay the Catholic tax, because it was the lowest, but their children were sent to the Protestant schools for education. In other words, one school panel received the money while the other bore the expense. This inequity led to an act of the legislature, passed in 1903, when for the purposes of school taxation Montreal Jews were regarded as Protestants, and thereafter all Jewish taxes had to be paid into the Protestant panel.

The Protestant school commissioners, besides giving the Jews all educational privileges, enacted a special conscience clause in favor of the children of Jewish parents attending Protestant schools, so that there should be no loss of marks by reason of their absence on Jewish holidays. This law the Jews regarded as their *Magna Charta* for educational purposes. Three years later the Jews made their first concerted effort to get representation on the Protestant school commission by providing that the commissioners should be elected by popular vote in various parts of the city. This was opposed under the British North America Act which was interpreted as giving citizens the right to determine the distinctive religious character and constitution of their schools, and that they should remain Christian. In 1909 and in 1916 similar efforts were made. In the meantime the number of Jewish scholars attending the Protestant schools had been growing—but their contribution in taxes to the Protestant panel had not increased in corresponding proportion.

> To understand this article the reader should bear in mind that Montreal has a dual school system. School taxes are applied according to the expressed religious preference of the taxpayer. There is a Catholic school panel and a Protestant school panel (or, as we should say, school board). There is no Jewish school panel nor provision by law for the support of Jewish schools. Hence the unusual situation described in this article.

Jews Pay Only 20 Per Cent

By 1914 the Jews had 8,194 pupils out of 21,131 attending the Protestant schools, and in 1921 they had 12,128 out of a total of 30,880 pupils. At this time an analysis of the situation showed that 40 per cent of the children in the Protestant schools were Jewish but that the taxes collected from Jewish taxpayers amounted only to 20 per cent of the cost of the education.

In actual figures the number of Jews attending the Protestant schools in the school year 1923-4 was 13,954, which at an annual cost of more than $60 *per capita* meant that the education of Jewish children formed an annual charge upon the Protestant budget of about $837,240, of which the Jews paid $370,279. The burden on the Protestant taxpayers had grown so heavy, by reason of the additional schools made necessary, that the commission appealed to the Provincial legislature for relief. The result was a law which provided that all Jewish taxes should be paid into the Protestant panel and the difference made up from the neutral panel—that is a panel into which incorporated companies, partnerships, and persons without declared religious beliefs paid their contribution to education. An indication of what the Protestants had been paying is given by the fact that their revenue for educational purposes was increased by more than $300,000 *per annum* without any increase in the tax rate.

The next Jewish agitation was for the appointment of a certain number of Jewish teachers, for the elimination of the reading of Christian Scriptures in classes where Jews were in the majority, and for facilities in the Protestant schools to teach the Jewish language and Hebrew faith. This was opposed and a move was made to have Protestant and Jewish children taught in separate classes or in separate schools. The Jewish holidays were a factor in this. In September and October, during a period of about three weeks, there are seven Jewish holidays falling on school days, which often depleted whole classes.

Claim Title to Separate Schools

The situation generally became acute. While the majority of Protestants were willing to educate the Jewish children, provided they paid their way, others claimed that the Jews had no constitutional rights in the Protestant schools.

On the other hand some of the Jews claimed they were entitled to have separate schools for Jewish children with Jewish teachers and Jewish school commissioners on the Protestant board.

At the time of the 1922 legislation the *per capita* cost of education in the Protestant schools was actually $63.41 and so the Protestants were still paying $3.41 toward the cost of educating each Jewish child. There has been a decrease in the number of children attending school in the year 1924-5 and the *per capita* cost has risen to $69.45, so that today the Protestants are paying $9.45 toward the cost of each Jewish child.

All About Your Friend the Toad

He May Not Be Beautiful, But Farmers and Gardeners Appreciate Him

By COURTENAY SAVAGE

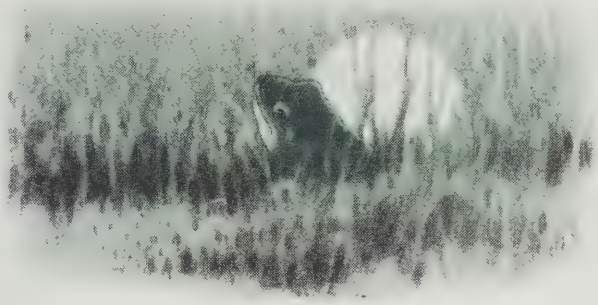
DOWN at the end of the garden lives your friend the toad, hiding away under a stone or a bush during the heat of the day, but hopping out at dusk to spend the evening hours, busy at his job of making it possible for mankind to eat!

Perhaps you do not consider the toad a friend, and feel sure that you could very easily live on without his aid. Perhaps you only think of the toad as an ugly creature about whose being so much superstition has been woven that if half of it were true the toad would be unworthy of his right to live.

But the facts remain. The toad is a friend to man, and each toad does a large share in making it possible for the human race to continue eating the fruits of the earth in due season.

The reason is this. The existence of all life is determined by its enemies, animal and vegetable life alike being subject to destruction. At the present time, due to civilization practically wiping out the danger of wild animal life, man's greatest enemies are to be found among the insects that yearly destroy millions of dollars' worth of the foodstuffs on which we depend for our living.

These insects reproduce their species by the thousands, and if it were not for the fact that they form the chief food of our birds and small animals they would soon overrun the earth, and in a single year destroy all the vegetation, leaving man to starve. And of all the destroyers of insects that are harmful to mankind the toad must be classed among the most valuable. for at least 70 per cent of the food consumed by the toad is harmful to vegetation. It must also be realized that the toad eats four times the capacity of its stomach during the course of twenty-four hours, and just what this capacity means will be better understood when it is known that a toad under observation consumed twenty-four medium-sized gypsy-moth caterpillars in one morning. Another toad under observation ate thirty full-grown celery caterpillars in less than three hours, while a third ate ninety rose bugs as fast as he could and at the end of the meal appeared to be still hungry.



By moonlight alone.

While this economic value of the toad is not visioned by the average person, the farmers appreciate the worth of the ugly little creature. The Department of Agriculture has made a careful study of the toad, and has arrived at the conclusion that (based on the destruction of cutworms alone, eaten during the months of May, June, and July) each toad is worth $19.40. That valuation was gained by reckoning one worm to be worth one cent. When you add to the cutworms all the other destructive insects that the toad eats, the importance and the commercial value of the creature becomes large.

The life history of the toad is decidedly interesting. To begin with the toad in one form or another can be found in every state in the Union. The common toad exists throughout the Eastern and Middle Western States, and is found as far south as Louisiana, Georgia, and Eastern Texas.

The toads emerge from their winter hibernation about the first of April, and proceed at once to the nearest shallow pool. It is not unusual to find hundreds of them congregated about a small pool during the mating season. The eggs are laid in the water, and there may be from four thousand to fifteen thousand. If the weather is warm the hatching period is from three to eight days; if there is a cold snap it requires from eight to twelve days. Toads are born in the water, and spend their early life in a fish-like state, breathing by means of gills. The transformation of a tadpole to a toad takes place somewhere between fifty to sixty days. Full growth is not attained until about the fourth year.

If the weather is moderate toads are active from the end of March to the middle of November. At that time they hibernate for the winter. In the process of hibernation the toad makes a burrow with its hind legs, and goes down backward, the hind feet possessing a spur which is of assistance in the digging. As the toad descends the dirt falls in over its head. Toads "dig in" below the frost level, and experiments have shown that they quickly go deeper if an unusually severe winter sends the frost far into the ground.

The normal activities of the toad, once the mating season is over, consist of remaining under boards, stones, or leaves during the heat of the day, and venturing abroad in search of food when the long shadows tell that the heat has gone.

It may have been this nocturnal habit that helped men of bygone days in their belief that the toad was a supernatural creature. The night to them was a time when magic ruled the land, and the ugly toad was just the type of a creature they believed to belong to sorcery. The eyes of the toad are very bright, and that probably gave rise to the belief that there was a jewel to be found in the head of (Concluded on page 31)

The common toad.

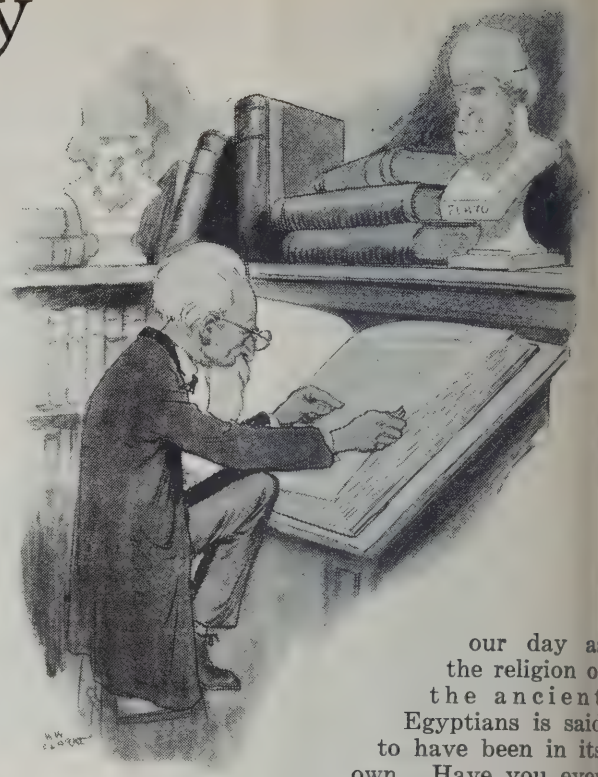
Regarding Philosophy

Diogenes—Apostle of Common Sense

By MURRAY GODWIN



When I read the lives of the philosophers in Diogenes Laertius, I arrive at the conclusion that they were nothing more than men who had common sense.
—Senor Pio Baroja.

MEN ordinarily speak of philosophy as though it were an abstruse art, evidently identifying it with metaphysics; or as though it were verbal trickery, by means of which black may be proved white, evidently identifying it with dialectics; or as though it were a complex manipulation of non-existent quantities, evidently identifying it with formal logic.

On the other hand, we sometimes hear it said of a cobbler or a tailor, or of someone who, whatever his occupation, is not "educated," "He's a philosophical old fellow," or, "He's a real philosopher"; and such a comment usually refers to the man's stoical acceptance of whatever the day may bring, or to his wise judgments on the conduct of his fellow human beings. We recognize the wisdom of these judgments simply by referring them to the facts of our own experience; and we do not pronounce them ourselves because, though all the facts that enter into them are ours, we have not the gift of putting those facts together so that they acquire a significance beyond themselves.

As a matter of fact, though philosophy is some thousands of years old, no one has yet succeeded in defining it to anyone's but his own, and in some instances a few of his fellows', satisfaction.

Plato's philosophy included metaphysics, dialectics, logic, ethics, natural science, political economy, law, theology, and what not. But Socrates, who was Plato's teacher, declared himself concerned with

Whatever good or harm can man befall
In his own house.

Not that he adhered to this simple, homely program; but such was his intent.

Literally translated, *philosophy* means *love of wisdom*. The Greeks conferred on certain of their first philosophers the title *Wise Men*. These *Wise Men* were concerned with the daily conduct of men on earth, and with knowledge only insofar as it was relevant to that conduct. Later writers protested that these early philosophers were not philosophers at all, but merely "shrewd men who had studied legislation." It did not occur to them that their term had in the course of time become corrupted. In its purity, *wisdom* undoubtedly meant practical comprehension of the life of men on earth, in both its physical and intellectual or spiritual aspects; and *philosophy*, or *love of wisdom*, was simply the art of attaining and making use of such comprehension.

Literally speaking, then, Socrates was a philosopher by intent, and in practice insofar as he was true to his intent; while Plato cannot be considered a philosopher at all. Plato's concern was chiefly with *abstract* Justice, Virtue, Beauty, and so forth, and when he brought these abstractions "down to earth," he invented an abstract "state" wherein they could become operative. The life of men, as we know it, was treated by him *negatively* —as something which should *not* be.

Most modern philosophers are careless compounds of the practicing Plato and the intending Socrates. They have removed themselves from the midst of life; in the columns of periodicals dedicated to their profession they discuss problems which concern their professional selves in a language of their own. When they break through the professional circle, even those who call themselves "Realists" or "Pragmatists" fail to arouse in us anything but laughter or astonishment. They reach the dimension in which we live by such a tortuous route that their wisdom is dissipated on the way, or strangely distorted by the channels through which it has been forced in the course of its journey. Philosophy has become as mystifying in our day as the religion of the ancient Egyptians is said to have been in its own. Have you ever attempted to read a "popular lecture" by Bertrand Russell? Have you struggled through the "Pragmatism" of William James, only to find that, in the end, this theory can be summed up in the words: Believe nothing that is not profitable? Surely, philosophy has strayed far from the path which Socrates intended it to tread, when it must move heaven and earth to come to a conclusion so commonplace! How many swindlers have lived according to this pragmatic creed while knowing nothing of "philosophy" at all!

The Literal Ideal of the Greeks

As for the popular philosophers—there is plenty of soothing sirup and iron tonic at the corner drug store but men have other ills than these will cure. Shifting the metaphor—when the writer reads their daily syndicated effusions, he feels as though some benign person were covering him up with a thick, fleecy blanket a warm comfortable shield to protect him from the chilly winds of this, at times, unfriendly world. But when night comes on, he discovers that the blanket is a pneumatic one.

So, after due consideration of these alternatives, it seems only just to decide in favor of the cobbler or tailor mentioned in the second paragraph in the literal sense, it is the cobbler or tailor who approaches nearest to the Greek philosophical ideal.

Among the ancient Greeks, Diogenes approximated most nearly to the literal Greek ideal. Far from him were Plato and his transcendentalism, Pythagoras and his mystic flummery, his parabolic apothegms, his crowd of awed novices and smug initiates. Diogenes was really modern, or was

ather of all ages. It is an apparent paradox that Plato, who was full of lofty maunderings and other worldliness, should come to be regarded as a somewhat paltry, time-serving fellow; while the words of Diogenes, who frankly admitted that exile and poverty had made him a philosopher, and who kept both feet on the ground—except when he swiftly raised the right one to refute some persistent debater—seem destined never to grow old. Yet, this is the case.

It is only word-magic—this regard for Plato that still cumbers our minds. One can find no basis for it in his works. Reading his famous "Republic," one sees that it is all a puttering attack on the democratic government which then prevailed in Athens; moreover, it is an attack based on an ideal which, wretched though it is, has never existed and never can exist in the world of men. When we read, further, in Pater's "Plato and Platonism," that Plato was an aristocrat who had been divorced from his privileges with the advent of the new democracy, we see on what a thoroughly materialistic foundation our hero erected his ideal state. Seeing that he was denied the bowing and scraping which his ancestors had received in the world of actuality, our idealist builded himself 'a mansion in the skies"—a piece of psychological fiction so strained and warped, so thick with peculiarities and nervous nonsense, that only the top-lofty style of its construction could have saved it from the ridicule which is its due. The "Republic" is a lasting monument to the hypocrisy of a man made malicious and envious by defeat.

Diogenes, on the other hand, never allowed his personal irritations to get the better of him, and so found it unnecessary to construct an ideal refuge in the World of Pure Being. Without reservation he first accepted the life of men on earth, and then, wishing to make that life richer and wiser, he set out to learn the truth about it, and to impart what he had learned to his fellows, in a spirit guided and informed by a love of what was best.

If the writer is not mistaken, Plutarch, that revered and suspiciously academic biographer of famous Ancients, overlooked Diogenes. Probably Plutarch, like Plato, was an idealist who found it impossible to accept the vulgar life which God had created without waiting for his approval; and of course no such idealist would accept Diogenes. But Diogenes Laertius has left us a rambling and extremely readable account of Diogenes in his "Lives of Eminent Philosophers."

Father François Rabelais has supplemented this account with a few anecdotes—or perhaps only one—garnered from some source not familiar to the writer. This anecdote—or the only one the writer remembers, if there are more than one—concerns the conduct of Diogenes in the face of an approaching siege at Corinth. It cannot be told in Rabelais' words, which are in this case not unprintable, but inimitable, without a copy of his "Book" to prompt one.

However . . . when news of an approaching army was heard in Corinth, the citizens began to bestir themselves, like so many busy bees preparing for the defense of their hive. Everywhere he went, Diogenes found men toiling like mad, repairing the walls, digging moats, setting great stones on the battlements with which to crush the enemy, bringing in food and other supplies to sustain the defenders if the siege should prove a long one; meanwhile getting in one another's way, each undoing what the rest had accomplished, everyone piling up impediments for the others to stumble over, and all getting nowhere in a great hurry with a good deal of confusion, friction and noise. No one had time to tell Diogenes what he could do to be of use; in fact, no one would pay any attention to him. After wandering for a time from group to group of frantically laboring men, the philosopher betook himself to the top of a little hill, carrying with him his tub, which ordinarily he used for a house. Presently the attention of the toiling citizenry was attracted to a commotion at the top of this hill. Diogenes was rolling and thumping his tub, turning it round, flopping it first on this side, then on that, climbing on it, dancing there, falling off again, kicking it down the hill, chasing after it, clambering with it to the top again, turning it bottom-side-up, leaping upon it, jumping up and down, leaping from it to the ground once more, and rolling it over and over without end, until the citizens were convinced that he had lost his mind altogether.

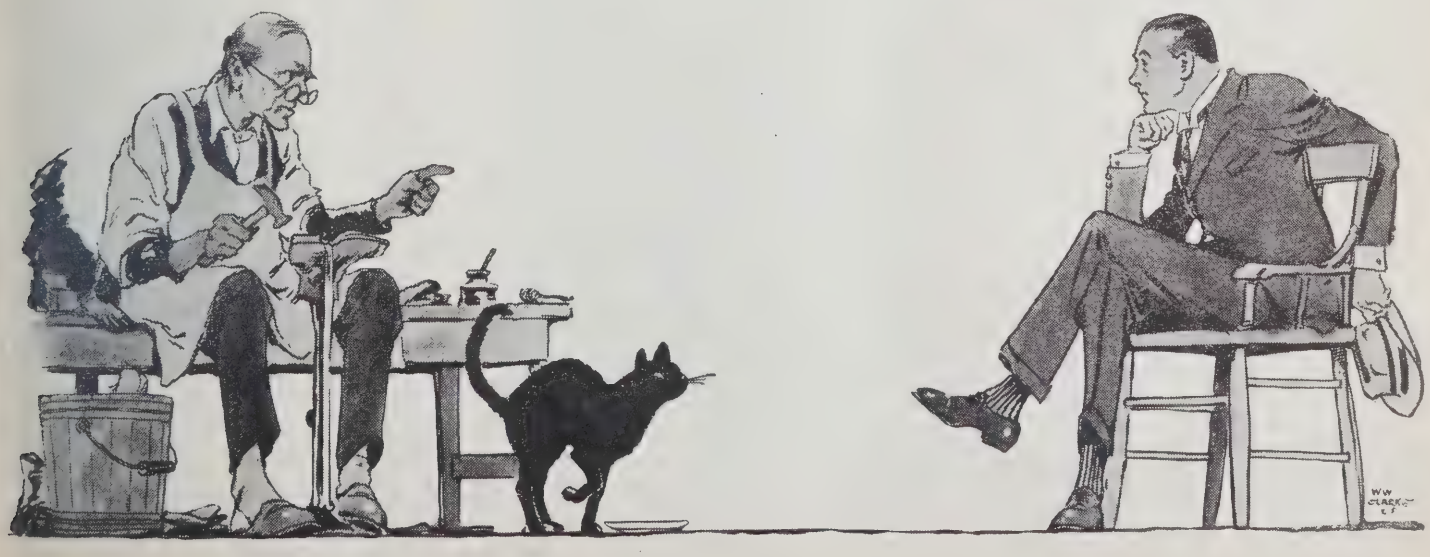
"Have you become at last entirely mad?" he was asked by some citizens who hastened to the hilltop.

"No," Diogenes replied, "but it did not seem fitting to me that I should be the only calm man among you; and since you had no place for me in the hustle and bustle below, I came up here to help in the hubbub as best I could."

In this fashion Diogenes rebuked the undirected and wasteful agitation of his fellows that he might persuade them to proceed with more wisdom and less precipitation in the defense of their city.

There is only one contemporary philosopher who, the writer imagines, would have acted in the same fashion, had he been in Diogenes' place. This is Charles Chaplin. Should it strike you as ridiculous that Charley should be regarded as a philosopher, the writer can only recommend your reading a certain essay on the subject by Dr. Elie Faure, the French savant and author of a "History of Art," which can be purchased at ten dollars a volume. Dr. Faure shows clearly in this essay that Charley's pantomime is founded on the same profound principle that underlies the works of Montaigne and Shakespeare.

Diogenes and Plato were contemporaries, personal friends and intellectual enemies. Diogenes used to ridicule Plato as an interminable talker, and as an intellectual thimblerigger as well. Once *(Continued on page 26)*



Menace of Gold Standard in Britain

What Will Be Its Effect on American Credit and British Industry?

By MAURICE MANNING

—London.

IT IS becoming increasingly evident that during the recent conference at Washington between the governor of the Bank of England and the head of the Federal Reserve Bank plans were formed for the foisting upon the world of the gold standard. Old monetary reformers in the United States will be reminded by this scheme of what was long known as "The Crime of 1873," when through indirect intervention of the Rothschilds, silver was demonetized by an act of Congress which was disguised as an innocent regulation of the coinage and so escaped scrutiny and discussion.

As in '73, the present scheme threatens an impoverishment of the producers and the debtor class to the enormous enrichment of the international moneymongers' syndicate. But, this time it is not going through without a struggle. British business men are being roused by the idea that the big bankers in London, supported by Winston Churchill, Chancellor of the Exchequer, should seek their own ends regardless of serious injury to legitimate trade and industry by "making British finance and consequently British business, the tail of the Wall Street kite!"

Mr. Norman's visit to Washington was quickly followed by an increase in the Federal Reserve discount rate. And Mr. Norman had been home less than a fortnight when the Bank of England put up its rate from 4 to 5 per cent. Questioned in the House, Mr. Churchill tried to dodge responsibility for this action, declaring that the treasury had no part in the decision. But everybody knows that it would not have been taken had the treasury disapproved.

Only a few days ago, the Federation of British Industries, representing the great majority of the trades of the country, addressed a significant communication to Mr. Churchill. Calling attention to the recent rise in the bank rate, the Federation suggests that "there are some grounds for supposing that the immediate object of British monetary policy may be to secure a return to parity with the dollar before the end of the year."

The act now in force banning exports of gold from England expires at the end of the year, and it seems to be generally assumed that the Bank's increase of the discount rate foreshadows an earlier return to the condition of a free market for gold and the restoration of the pound sterling to parity with the dollar; that is to say, to the exchange rate of $4.86½, the current rate at this writing being $4.78½.

The change involves a serious deflation of the present currency volume and a disturbance in values and prices generally. It means an arbitrary and artificial forcing of the proportional exchange values of the pound sterling and the American dollar, which should naturally reflect, as it now does, the fluctuations in the English demand for dollars as compared with the American demand for pounds sterling in the settlement of international balances.

It should be remembered that, in reality, the terms "dollar" and "pound sterling" have no necessary relation to gold coins or to the fixed weight of gold bullion. The dollar is simply a token or denominator of the American unit, not of money but of *credit*. When an American merchant buys a bill of exchange for one thousand pounds, he simply buys a credit to that amount exchangeable for English goods and services. Similarly, when a Briton buys a bill of exchange on New York for a thousand dollars what he really buys is a transferable credit good for American commodities and services. If, in either case, the credit could only be exchanged for a certain amount of gold, it would be of little use; as little use as if it could procure only copper or iron. Of course, any of these metals—like corn, wheat or cotton—could be sold for some form of fluid and transferable credit exchangeable for goods or services of any order offered on the market, but that would be going back to the primitive stage of barter as a method of exchange.

The RIGHT HON. WINSTON CHURCHILL, Chancellor of the Exchequer.

The letter of the Federation of British Industries already mentioned, referring to the supposed gold basis policy of the government, calls for a definite declaration of its intentions. It goes on to say:

"Since such a policy must obviously involve a period of dislocation, if not of active restriction of credit, which cannot fail, for a time at least, adversely to affect the operations of industry, and especially our export trade, the Federation feel that they are justified in pressing His Majesty's government to make known its intentions at the earliest possible moment, and, in the event of an early return to the gold standard being contemplated, to indicate the precise steps by which it is hoped to secure such a return, and how, when once achieved, it is to be maintained . . . It is of importance to all engaged in industry, both employers and employed, that the present uncertainty should be dispelled."

That a forced return to the gold standard would involve grave dangers to British industry was the keynote of a significant address before the Commercial Committee of the House of Commons by J. M. Keynes, the economist.

"We should have as our object," said Mr. Keynes, "the stability of internal prices and the adequacy of internal credit to the requirements of our own trade and industry, instead of the gradual deflation of our prices relatively to those in the United States. Any premature return to the gold standard would expose British industry to the possibility of serious shocks. A movement of gold to or from America which would drain or swamp us would be almost unnoticed by them. Certainly conditions in America would play a bigger part in determining our bank rate and our credit conditions than would the needs of our own trade.

"We should be running the risk of having to curtail or raise the price of credit to our own industries, merely because an invest-

Editorials

Just for a Change

JUST for a change, our America may be conceived as a nation containing a potentially rich and deep cultural life, which under pressure from above finds its outlet in meaningless vagary. A good many of our self-confessedly powerful minds spend their days and nights exhorting the nation to practice this and honor that. The nation, sincerely trustful, does its best to follow them; but repeating Coue formulas and eating more macaroni strangely enough doesn't make any call on the inarticulate desires and aspirations surging under the nation's belt—or at least not worn on its sleeve; so the dance goes on, and the joy is unconfined.

Just for a change, wouldn't it be fine if our best political, legal and sociological exhorters would pipe down for a while and kind of join us in enjoying their silence?

Of course they are the nation's voice, and if the nation wasn't so busy getting things done it would probably recognize its tones. But as it is it seems almost as though our voice were only occasionally our own. When you try to talk and work at the same time, you have to slight your work, or else let your tongue just run along. Under the conditions, then, it would be nothing to wonder at if the nation got to talking absent-mindedly, as it seems to be doing, sometimes.

This is ridiculous, true enough, but it would appear to be a fact. And the only way to put it in its place, one imagines, is for the vocal organs to rest and give the nation a chance to catch up.

Besides—you can't tell but what the silence might give God a chance to say something. It might be a good idea to pause just to make sure we weren't interrupting *Him*.

Regarding Ethics of Criticism

LEGITIMATE criticism is a wholesome thing. It stimulates action and as a rule causes its subject to search for new angles of action, and frequently find them. Purely destructive criticism, however, is not much good to anybody. Criticism to be of any potential use must be constructive; it must contain suggestions.

No one should resent criticism of this kind if it is well meant.

But it is not only individuals but departments and institutions that resent criticism; it is usually taken as a reflection on the persons composing that institution or department. There is no reason why this should be so. Although individuals may feel themselves responsible for the mistakes of the department to which they belong, it is often the system that is at fault.

Government departments usually object to criticism of any description. This is not as it should be. It does not make for efficiency. Criticism if meant for the common good should be listened to with respect and carefully weighed. There is no obligation either to reject it or adopt it.

Literature and Local Talent

LITERATURE is ideally supposed to be disdainful of national borders and in a sense this is so. Somehow a great book, now matter how dyed with local color, reaches the human heart regardless of the linguistic mode through which it must pass. In another sense, however, literature is extremely regional. This regionality is more difficult to explain than the more generally recognized universality of literature.

Once New England was the germinating place for most American books of whatever cast. Then the center of production moved to New York, though admittedly what New York produced was, except in a few cases, by no means equal in quality to the literary product of New England. The Pacific Coast and the West generally was the next hovering-place of literary inspiration. In the latter part of the nineteenth century Chicago began to bloom. Just now, novel after novel springs from the Middle West.

Various explanations of this localization during a given period fall by the way. It is said that literature appears when life in a community becomes settled and a certain number of people are given surcease from the business of making a living. Leisure leads to reflection and reflection to expression by way of words. This is plausible but does not comprehend the facts. New England was, it is true, heavy with deliberate culture, but how about the West? Surely Mark Twain and Bret Harte were not members of a leisure class! Consider, furthermore, that great areas in the East, where life has been running in established grooves for literally centuries, produce nothing in the way of creative literature at all. Here is leisure a-plenty, and culture subsidized to the limit, yet the fact remains that no living word comes of it. On the other hand, the Middle West, turning from hard pioneering to intensive farming and manufacturing, finds time and feels the impulse to turn out books that arrest the attention of the nation.

"The Bankruptcy of Liberalism"

A GREAT deal has been said since the war about "the bankruptcy of Liberalism" in the United States. Before the great conflict, it is claimed, "Liberalism" enjoyed a certain power and prestige. Somehow, during the struggle, its forces were dissipated, its unity lost. Now, its more audible members look here and there in vain for some unshattered remnant of the forces that once served "the Liberal ideal."

Certain "Liberal" periodicals, some time ago, went far to attempt an explanation of the failure. But no matter which version of the matter one accepted, all those expositions left one as much in the dark as before. The truth seemed to be that "liberalism" did not know what its aims were, and consequently could not tell whether the recalcitrant "Liberals" had departed from them or not.

Evidently, above several coincident attempts, in

various parts of the nation, to secure "home rule" for municipalities, reform court procedure and investigate cruelty and graft, some generalizing gentlemen must have constructed a theory to account for these activities. That the belief grew that the activities had resulted from the theory, instead of the theory from the activities, will in no way surprise anyone who has become aware of the capacity for vagary possessed by the human mind.

Naturally, after that had happened, "Liberalism" —the theory *in vacuo*—could hardly escape its doom. Persons who have begun to act "on their own" are hardly apt to be guided by theories resulting from some inactive person's observation of them.

The "bankruptcy of Liberalism" is merely the bankruptcy of "Liberals." These "bankrupt" gentlemen never had anything invested in the "movement" but paper, anyway.

The "Nineteenth Hole" in America

"AT THE golf clubs in America," says an English writer, "the 'nineteenth hole' is now the locker room. Here before lunch, and again at the end of the day's play, the members foregather in friendly groups over cocktails and highballs which the attendant with shaker and cracked ice of his own providing prepares for them from materials they supply."

The writer further says: "The people in England know that America's Prohibition Law is being widely evaded; but it is necessary to travel to the United States to realize how completely in many respects that law has become a dead letter."

The author of this is apparently an enthusiastic golfer, and as such he would spend much of his time in the United States sampling the golf courses. Therefore, as the "nineteenth hole" is a popular institution in England he would naturally want to sample that also.

He accordingly does so with the assistance of friends who are anxious to make him feel "at home," and he concludes that the "nineteenth hole" is also a recognized institution in this country. But *two swallows don't make a summer.*

Franklin and the Moderns

IT IS interesting to note that the theory held today of the mechanics of tornado formation and procedure coincides exactly with that advanced by Dr. Benjamin Franklin in 1753 or thereabout. In the complete edition of Dr. Franklin's works is a diagram to illustrate his theory. But the text itself is so clear that the drawing serves only as an extra guaranty.

The general conception of Dr. Franklin as a provincial Hogarth takes in only one relatively unimportant part of his character. His title of "philosopher" is thought to refer to his capacity for homely wisdom. In fact, it refers to his contributions to physical science. The examination and explanation of natural phenomena was in his day regarded as a philosophical function. What opened the doors of the Royal philosophical society to him was his invention of the lightning rod and his electrical experiments in general. His scientific activities comprehended a great deal more than the study of lightning. In his correspondence he tells of experiment after experiment made by him with electricity generated in his laboratory. He observed its effect on fowls, metals and other creatures and substances. He tested and classified materials according to their conductivity. He used electricity as a curative force in certain paralytic diseases.

Moreover, he wrote about his activities and speculations in such admirable language that one would wish to see modern discoursers on scientific subjects take him for a model. Even when he makes use of terms evidently contrived by himself, one follows him more easily than one could possibly do Bertrand Russell or any other contemporary enlightener of the people.

The Triumph of the East

"EAST is East, and West is West," says the poet, "and never the twain shall meet." And a philosopher, most Western in sentiment, says, "The poets lie too much." In this case, it would appear, he told a plain truth. Beginning with Plato, the philosophers of the West have fallen increasingly into mystic, passive contemplation, a mood exactly opposite that regarded as the very essence of the Western ideal.

It is our custom to look at Emerson as a thoroughly American thinker. And yet—there is his tendency toward a passive sifting of all things, and toward taking refuge in the conception of the "Over-soul," an excessively reflective creation; and what of his intense and mystic faith in the superiority of the effortless intuition over the striving mind and will? All this is merged without trace of contradiction with his Western concern with affairs, but it is none the less Oriental for that.

Then there are the poets—for example, A. E. Housman:

> "*Be still,* my soul, *be still, the arms you bear are brittle;*
> *Earth and high heaven are fixed of old and founded strong.*
> Think, rather—call to thought, if now you grieve a little,
> *The days when we had rest, O soul, for they were long.*"

How much of Western strife and struggle does one find in that? Serene and Oriental despair!

No one seems so far to have noticed it, but the poem for which our own John Burroughs is best remembered, and for which he received most applause during his life, is completely Oriental, mystic, passive:

> "Serene I *fold my arms* and wait,
> For lo! my own shall come to me."

Contrast that to a real Western pronouncement:

> "Trust in God, *and take your own part!*"

Much more could be said—many more examples adduced. For better or for worse, Oriental elements have mixed unobtrusively with the philosophy and poetry of the West.

Mr. Ford's Page

IT SEEMS to be the tendency of every group, founded originally to maintain and extend some principle, to become more and more forgetful of that principle in favor of problems in which that principle is not the least involved.

In the case of a need important only in the eyes of a peculiarly situated few, the majority of people will fail to be aroused. Such needs take a great deal of explanation, and often, even where this explanation is accepted, it does not lead to any effective result. If the problem that needs solving, in a case of this sort, has a definite existence in fact, it affects only the few; and the few cannot get enough people round to where the latter are interested in what can be seen from that particular viewpoint to bring about active consequences. Sometimes, when a widespread interest and enthusiasm are aroused, it will be found that the problem at the center of this interest and enthusiasm is actually represented in only a vague or vestigial form. Then, though interest may be great, effective action is absent because hardly any two of the group primarily interested in the problem can agree on the characteristics possessed by the doubtful or absent portions of the object to be dealt with. Naturally, this results in a variety of aims. Enthusiasm is aroused but action is distributed so widely that it is dissipated and lost without any solution being achieved. The situation is something like that in the old fable of the blind men and the elephant. Only, in this case, it happens that the object of the group's attention has no central existence. Far from being mistaken about the appearance of the object with a part of which each is acquainted, the group is mistaken in believing that the presence of the various" parts" implies the existence of a central whole.

THE tendency of every group to forget the principle on which it was founded has always been the great cause of organized failure. Established to maintain and extend a definite truth, the group trend has been consistently toward the self-absorption of the energy it receives. Could great organizers foresee and provide against this seemingly inevitable trend, the world would be afflicted with less ponderous group machinery and would possess much more efficient facilities for carrying on its vital functions than is the case today. In our time we are seeing the growth of the spirit which will eventually succeed in overcoming this Law of Adverse Returns.

But whether a group succeeds or fails, its tendency is to forget the principle that its first members established as its foundation.

At first the interest of the members is centered on the problem they are gathered to solve. The establishment of offices, rules of action and procedure helps to keep their efforts more directly applied to the solution. But, as time goes on, these centers of activity and guide lines, intended to prevent the waste of effort, tend to become regarded as fixtures, fundamental as the principle that brought the group into existence. It is forgotten that a tree may be sawed as easily and perhaps more profitably than it can be chopped. Each succeeding generation of members seems to contain more and more persons who are not able to imagine the mechanics of the formation of the group. These persons accept the group as an institution, and regard the parts of the institution as being all of equal importance. Finally, the reverence of these individuals for the institution becomes so unqualified and so indiscriminate, that the skipping of a paragraph of the minutes, or some such incident, is magnified in their eyes to the proportions of an attack on the principle on which the group was founded.

Indeed, the first flush of enthusiastic acceptance is in some cases so badly distributed over the extent of the institution accepted, that the individual of a later generation becomes engrossed altogether in the study of rules and from beginning to end fails to discover an inkling of the really important underlying principle. He is like a man who starts out to visit a factory and who never gets past the fascinating preliminaries of the reception room.

Meanwhile, more rules and regulations are being added, to the further disadvantage of the principle and action concerning it. Moreover, offices multiply, bureaus and committees increase. And the rule is always, the more offices, the more office-seekers. The multiplication of offices and office-seekers gives birth to a thousand intrigues for favor and place, until finally the group's energies are being almost entirely absorbed internally. Exactly as though it were a turbine so heavily loaded with superfluous transmitting machinery, that out of all the power poured into it, only enough emerged to turn a wheel of insignificant size. And sometimes this insignificant external wheel, even, is so situated and connected that it turns its energy back into the ponderous parent mechanism.

The problem that modern organizers must face and solve is that of insuring direct application to the object defined in the principle of the increasing energy of the group. There is every reason to think it can be done. The increasing power of the locomotive did not find its way out through the whistle or the stack, nor were more wheels added to furnish it with an absorbent for its new energy, nor were more cars for the accommodation of the officials attached to each train. More freight and passenger cars were pulled, at a greater speed. The same instinct that guided the development of the locomotive can direct the progress of a group, with as satisfactory returns.

Books! Books! Books!

Browsing Among Second-Hand Stores of Old London

By W. TEIGNMOUTH SHORE

A London second-hand bookstore.

WHEN I was a young chap, with not too many pennies in my pocket and far too few silver coins, I used to frequent the second-hand bookstores in London, occasionally making a humbly cheap purchase; but more usually gloating over treasures far beyond my reach. My happy hunting ground chiefly was a narrow byway, which has long gone to make way for Aldwych and Kingsway, so well known to American business men. This Holywell street, in the Strand, ran from the church of Saint Clement's Danes to where once upon a time stood the tall Maypole, hard by the church of Saint Mary-le-Strand; redolent of a very old world these church names and this Maypole! A narrow, dingy street, but there were delectable bookstores there, and always the faint hope of a great find; of some book of great price, which had escaped the keen eye of the bookseller and been marked far below its value. Such things have happened, but I've only met with one—if I may coin a word—happenee. He had bought what is called a parcel of books at a country sale, and among the waste paper used to prevent the string cutting into the bindings he found a very fine copy of the First Edition of Gray's Elegy!

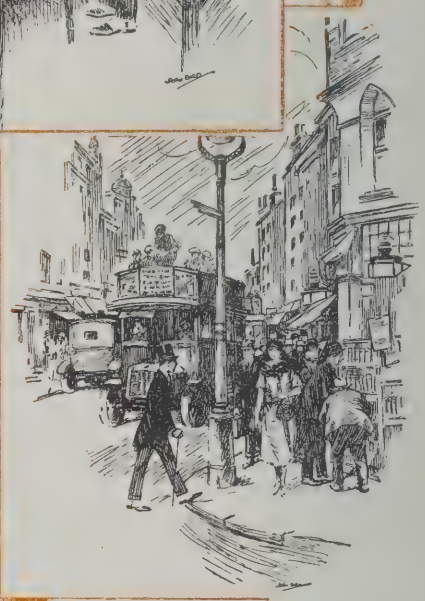
Little did I foresee in my youth that I should myself one day be a second-hand bookseller, but so it chanced. For a year and more—then the World War shut me up—in my little Book Parlor I sold books, very often my heart being sore at having to part with some of them. It was a happy time, and not without those small adventures and moving incidents that come in even so placid a life as that of a dealer in books. It was pleasant there; crowded shelves all around; a table in the center, with a vase of flowers; two or three comfortable armchairs, wherein my customers rested while they tasted my wares; in winter a jolly fire upon the hearth; my big, book-littered desk in the corner. All day long the coming and going of footsteps along the street, and every now and then their ceasing as man or woman stopped to look into the window and sometimes to come right in. Outside there was a long shelf of cheap books; and also a box full of more or less tattered volumes; copies of tenth-rate poets, odd volumes belonging to incomplete sets, each one at the price of four pennies. I still love ransacking what is called the "four-penny box," though alas it is since the war usually a six penny! One rainy afternoon I noticed an old man, quite well-dressed, hovering over my four-penny box, turning over the books. He came in with three in his hand, which needed three more to complete the set to which they belonged. He tendered me a shilling and I asked him if he was aware that they were odd volumes.

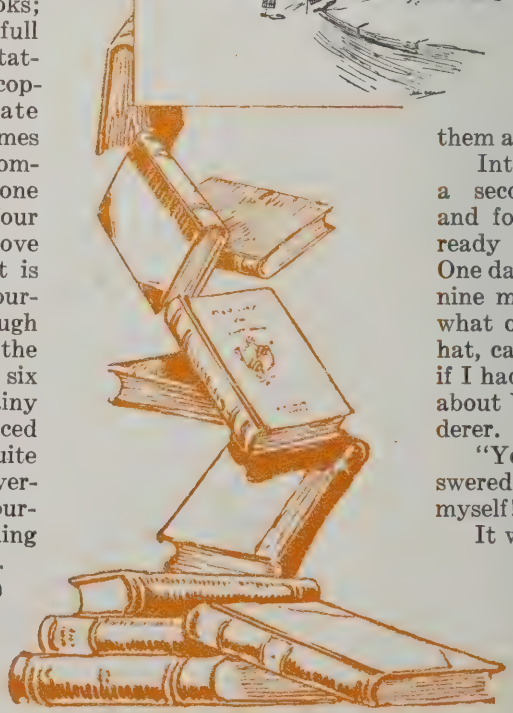
"Yes, that's why I want them," he said.

"Oh, I see, to complete your set?" I asked.

"Oh, no, but it's my hobby to buy odd volumes; it's such a pleasure hunting for the others."

A pathetic incident, one of several, was when a pretty young widow, in the very deepest mourning, asked me if I would buy the valuable library she had been left by her husband. She showed me some specimen volumes that she had brought with her, saying that the others, several thousand, were equally good. Good! Poor soul, they were moldering, worn volumes of old sermons and bygone theology. She nearly wept when I told her that she would find great difficulty in selling them at even a penny a time.





Interesting men drift into a second-hand bookstore, and for the most part are ready to talk and gossip. One day a tall, almost saturnine man, wearing a somewhat old-fashioned tall silk hat, came in, and asked me if I had any books or prints about Wainwright the murderer.

"Yes, Mr. Irving," I answered, "I'm fond of crime myself!"

It was H. B. Irving, son of Sir Henry; actor, author and student of criminology, upon which he wrote several books. Few men have known more in-

imately the history of crime. He used o relate that his father had told him ow, when he had sat up very late one ight with Tennyson, the poet said that e had not kept such bad hours since e had been absorbed in a discussion n murders with Doctor Jowett, the amous Master of Ballial College,)xford. We are all prone to crime!

Holywell street being swept away, nany of the bookselling fraternity be- ook themselves to Charing Cross Road, comparatively modern thoroughfare. do occasionally stand outside the hops there, looking, longing, occasion- lly tasting, but the mere presence of ookshops cannot make a booky place; t is too busy, too strenuous; you are ostled as you loiter, and undisturbed ditering is the essence of book-hunting, t least it is to me. My purse will not ermit me to visit—with any satisfac- ion—the booksellers who deal in tip- op goods, which can be afforded only y millionaires. But there is one shop I o love to frequent, where there are ooks for lean purses as well as for fat. t is situated in a narrow turning on the outh side of famous Holborn, that ncient street of many interesting mem- ries. It is called Great Turnstile and eads into Lincoln's Inn Fields. Its ame commemorates the existence of a urnstile here which served to prevent orses passing through to the Fields, nd used to be known as Turnstile lley. Much should I like to let my en run away with me—it does do so ometimes when I'm wandering about ld London—writing about the fas- inating story of Holborn and of Lin- oln's Inn Fields, but I must stick to my ooks—my closest friends.

Queen Elizabeth's Book

For many and many a year past there have been sel- lers of second-hand books in the Great Turnstile. It is like turning out of a ast, fast river into some quiet, arrow tributary stream when one eaves the roar of Holborn for this hady alleyway. I do so now and hen to call on my kindly friend, Frank Iollings, and to have a crack with him ver books, book-buying and booksell- ng. Quieter still it is inside this seemly ld store, a longish room, lined with ooks, among which it is very pleasant o browse. But better still to go to the anctum upstairs and there turn over reasures, looking longingly and lov- ngly at the title-pages of rare works of ncient and of modern days, or rever- ntly handling a precious binding. It as only recently I sat there, smoking nd gossiping, and, being a wise man, stening far more than I talked. Frank Iollings has a memory as well-stocked s his shelves; it is always excellent to sten to a man talking about what e knows and has done. He agreed ith me that wonderful "finds" are mazingly few, but instanced his hav- ng discovered in the West Countree (of England) in the hands of a country clergyman Queen Elizabeth's Prayer Book, in jeweled tapestry binding. It is not merely the scarcity or market value of a book that appeals to the genuine bookman—I think he felt as I did that there was a thrill in handling the volume from which the great Queen had prayed. It is a pity that books cannot write their autobiographies! I'd give much—much more than I can afford!—to read the autobiography of a First Folio Shakespeare, of the First Edition of Oliver Goldsmith's "Vicar of Wakefield" or of one of Jane Austen's novels.

First Editions

Of late years, say about forty or so, there has sprung up a very consider- able number of collectors of first editions of quite modern writers, among them George Gissing, Oscar Wilde, George Bernard Shaw, Joseph Conrad, Max Beerbohm, Thomas Hardy, Lord Dun- sany, Barrie, William H. Davies, John Masefield—to name a few only, recalled at random. Volumes that a little while ago were worth but a few shillings are now sold for twice and thrice as many pounds. "The Picture of Dorian Gray" and "The Sphinx," for examples, bring twelve pounds or so! In fact, if one could only see into the future, it would pay to "lay down" first editions as you do wines that promise to mature into something exquisite. But it is rather pitiable to think that such a man as George Gissing struggled with pov- erty for many years and that now he is dead he is the fashion among book col- lectors, many of whom are by no means book lovers. When I first started a bookstore I found to my surprise that there was no real demand for first edi- tions of Samuel Butler, the author of "Erewhon" and "The Way of All Flesh," although many of his early works were quite scarce. So I bought all I could find, often for quite nominal sums; priced them and sold them high, and now he is among the much-sought- after!

Cunning Book Thieves

The first volume of poems issued by William H. Davies was brought out by himself in paper covers at the mod- est price of two shillings and sixpence (just about half a dollar). I wanted a copy badly for a customer; could not find one. Then one morning a stranger came into the store, this very volume in his hand, a perfect copy, and offered it to me for a few shillings. I gave him twice as much as he asked, to his great amazement. Later I bought an equally good copy; my good friend Davies wrote in it "This is my first book," signed this, and the volume went to America for many pounds. It is a unique copy! Fortunate he who pos- sesses it!

Another recent fad is the collecting of works issued by the various private presses that have from time to time done excellent work in this country; notably the Kelmscott Press of William Morris, whose "Chaucer" Frank Hol- lings sold to another social agitator, John Burns, who owns perhaps the finest collection of works on London. Others of fame being the Ashendene, the Doves, the Eragny, the Riccardi and the Vale presses. All known to and their products desired by private press fans.

Just this in conclusion—the second- hand booksellers' lot is not *always* a happy one! Among other troubles are the doings of cunning book thieves. There is room here for only one story, told me by friend Hollings. He had cataloged a copy of the Ashendene "Dante," a beautiful and valuable pro- duction. One morning he received a letter from a consular office in a North England town, from a collector who said he owned all the works issued by this press with this one exception. Might he see it, with a view to pur- chase?

The Crook and "Dante"

Hollings wrote "Yes," provided that the cost of car- riage and of mak- ing a box to contain the volume safely was paid by Mr. X. A day or two later Hollings was rung up from a well- known London hotel, the speaker say- ing he was the son of Mr. X, and would call about the book. He did so, the next day, just before the store was to be closed. He was a well-spoken, ob- viously well-educated and assured young man who chatted intelligently about books. He was in town for a day or two and would, with Mr. Hollings' kind permission, take the "Dante" with him for his father to inspect. He casually showed Mr. Hollings's letter to Mr. X, which was doubtlessly done intention- ally to banish any doubts there might be as to his identity. So the fine folio was packed up and parted with. But as he wended his way home, doubts began to rise in Hollings's mind—a pre- monition that something was wrong, so next day he telegraphed at consider- able length to a fellow bookseller in the northern town, and the answer came that the pretended Mr. X did not exist and that the man who had carried off the "Dante" was a notorious crook, very much "wanted" by the police! And it transpired that he had sold the other volume the morning after he had got it into his hands for a considerable sum to another London bookseller!

Here and there are to be found booksellers who are not above "faking" books, but they are very few and far between.

Bookselling is a worthy calling and booksellers are in the vast majority worthy, straightforward men. Almost more than any other visitors they wel- come those who come across the Atlan- tic with a pocketful of cash and ready to buy what is good.

Bonds That Cannot Be Collected

Twelve States That Repudiated Bonds—Daniel Webster's Assurance

By E. L. M'COLGIN

PRACTICALLY every owner of state bonds will be surprised to learn that there are no legal means of compelling payment, and, what is more definite, that twelve states have repudiated their bonds and others have deferred interest payments from time to time. The Eleventh Amendment to the Federal Constitution permits sovereign states to sell their bonds by pledging their solemn "faith and credit" and then to refuse payment without giving any reasons in court.

Chief Justice Waite, of the United States Supreme Court, said, in 1883, in deciding a case where a state that was sued invoked the Eleventh Amendment to avoid payment of its bonds:

> "Neither was there when the bonds were issued, nor is there now any statute or judicial decision giving to bondholders a remedy in the state courts or elsewhere, either by mandamus or injunction against the state in its political capacity to compel it to do what it has agreed should be done, but what it refuses to do."

Some people have mistakenly assumed that repudiation of state bonds has been confined to a few southern states disavowing bonds issued in their names immediately after the Civil War by carpetbag administrations. Not so, repudiation was practiced before the Civil War by northern as well as southern states; and following that war southern states repudiated about as many bonds issued or authorized before the conflict as they did carpetbag bonds.

How Armed Coercion Is Avoided

The National Government, which has admitted the carpetbaggers were usurpers, and the respective states that repudiated other bonds, have defrauded foreign investors as well as American purchasers. Only our strength and the jealousy of European governments of one another have enabled us to avoid armed coercion such as the government of their bondholders have frequently employed to make Turkey, Egypt, China, and San Domingo pay up.

This is a period of hectic public spending and the extravagance furthered by state bond issues is comparable only to the pre-Civil War period that was responsible for the first repudiations of state bonds. The present owners of state bonds have no assurance that if periods of temporary stress come again, politicians will not persuade states to repudiate irksome obligations.

Brokers who market state bonds fail to inform the public of the existence of the Eleventh Amendment or the repudiation records of states whose new bonds they sell. Therefore, Congress could fairly require as a condition precedent to their carriage in the mails that the amendment, which follows, be printed on every state bond and also quoted in every circular or advertisement that purports to describe such bonds:

> "The judicial power of the United States shall not be construed to extend to any suit in law or equity commenced or prosecuted against one of the United States by the citizens of another State or by the citizens or subjects of a foreign State."

The Eleventh Amendment was made early in the life of the Republic. One Chisholm, in 1793, sued the state of Georgia, and the United States Supreme Court held that the suit was proper. Georgia was furious at what she considered a challenge to her sovereignty, and her legislature passed an act that condemned to death without benefit of clergy any Federal marshal or other person who should presume to assist in serving a process against the state. This suit together with the subsequent one of another person against Massachusetts made the other states apprehensive and at their behest the next Congress passed and submitted the Eleventh Amendment which was promptly ratified by all the states.

Fortunately for investors, cities, townships, counties, school districts and special taxing districts are public corporations that can be sued and the courts have always required them to satisfy their bondholders.

During the first half of the last century, the states embarked upon what often proved to be over-ambitious public railroad, canal, turnpike, and banking projects. States which had been accustomed to think a dozen times over a tax of a hundred thousand dollars now began to negotiate loans of millions. The American bond market could not absorb all these issues and many states turned to Baring Brothers, the famous London bankers, to sell these bonds abroad. In 1839 the Barings prudently inquired of Daniel Webster, Secretary of State, what measure of security the purchasers of bonds of American states would have for their investment. Webster replied in a formal state paper which avoided reference to the Eleventh Amendment but abounded in lofty sentiment. It was widely distributed among prospective foreign buyers of the bonds; at home it was commented upon by newspapers and political orators with "swelling pride." Following are salient excerpts from Webster's statement to Barings:

Daniel Webster Replies to the Barings

> "The states cannot rid themselves of their obligations otherwise than by the honest payment of their debts. . . . Any failure to fulfill its obligations would be an open violation of public faith to be followed by the penalty of dishonor and disgrace; a penalty, it would be presumed, which no state of the American Union would be likely to incur . . . If it were possible that any one of the states should at any time so entirely lose its self-respect, and forget its duty as to violate the faith solemnly pledged for its pecuniary engagements, I believe there is no country upon earth—not even that of the injured creditor—in which such a proceeding would meet with less countenance than it would receive from the great mass of the American people."

Consternation Prevailed in Minnesota

Webster was regarded in England as well as at home as the greatest American lawyer of his period. However, his quest for the presidency was the passion of his life and it may be that he did not care to offend state pride by publicly indicating to Barings the dangers lurking in the Eleventh Amendment. On the other hand, the record of British diplomacy suggests that that government would have regarded a like declaration by her foreign minister as an engagement of the national honor regardless of domestic laws.

Minnesota in 1858 issued $2,275,000 of its bonds to assist in the construction of several railroads, which collapsed before they were completed. As salvage the state took over about two hundred and fifty miles of graded roadbed and five million acres of land grants.

The citizens of Minnesota, then a struggling pioneer state, regarded with consternation and hostility the payment of these bonds for fruitless ventures. The legislature refused to pay until the people voted their assent, which they declined to do. The flouted bonds constituted a bar to other state borrowing; in 1881 a compromise was effected whereby the state issued new bonds for the old on the basis of fifty cents on the dollar.

Michigan, in 1837, issued five million dollars of bonds for an ambitious

nternal improvement program. The ›onds were delivered to a couple of Philadelphia banks that paid the state or part of the bonds and then failed ›efore complete payment was made. However, the banks had sold the bonds o their clients who in many cases paid or them in full although the banks had ›ot remitted to the state. Michigan efused to pay the individual buyers of hese bonds more than it actually re-eived from the banks. In 1845 legis-ature authorized issuance of $1,387,000 ›ew bonds in place of $5,000,000 issue.

Mississippi holds three repudiation ecords: It was the first state to prac-ice repudiation; the bonds were gnored despite the fact that then the tate permitted itself to be sued in the tate courts and those tribunals held he bonds valid, and, lastly, the state onstitution of 1875 specifically re-›udiated the two bond issues in ques-ion by name.

During the eighteen-thirties Mis-issippi sold seven million dollars of its ›onds to capitalize two state banks vhich promptly failed. In 1852, de-›ite the court decisions and the desire ›f many citizens to fulfill the obligations, he politicians submitted the question ›f interest payment to a popular vote nd it was defeated by four thousand. Mississippi, in 1923, had an assessed valuation of $702,-338,410 and a bond-ed debt of $16,961,-536, which was $8.29 *per capita.*

Florida's Bonds Declared Unconstitutional

Florida's territorial government, in he thirties, issued $3,900,000 of bonds o found banks which later failed. The state government repudiated these ›onds claiming it was not responsible or the obligations of the territory al-hough it cheerfully took the assets.

Florida issued four million dollars ›f other bonds before the Civil War to assist new railroads. The railroads collapsed and the state foreclosed on heir properties. However, before the foreclosure litigation was completed the state courts declared the bonds un-onstitutional in a decree that was as emarkable for its unjudicial language as for its so-called reasons. The as-essed valuation of Florida in 1923 was $445,103,181 and the state debt was $1,065,410, or $1.02 *per capita.*

North Carolina repudiated $12,805,-000 of bonds in full in 1879 and at the same time scaled $18,892,645 of other bonds to $5,006,616. Bonds issued before 1861, $8,761,245, were scaled 60 per cent, a block of railroad-aid bonds were scaled 75 per cent and some other bonds 85 per cent. Aside from this pre-war item, most of the debt was contracted under the auspices of the carpetbaggers.

The estimated value of all North Carolina property in 1922 was more than four and one-half billion dollars and the state debt in 1923 was $54,093,-700 or $20.16 *per capita.*

Tennessee, by 1852, had issued $21,000,000 of bonds to finance rail-roads, banks, and other schemes. The debt was doubled during the next ten years. The state's finances were so chaotic after the war that private as well as public credit was gravely affected outside the state. This loss of confidence stimulated efforts to make the bondholders recognize the necessity of partial repudiation, culminating in 1883 when about nine-teen million of the debt was scaled 50 per cent and more than two million were scaled an average of 22 per cent. The bonds held by educational, literary and charitable in-stitutions and the widow of James K. Polk were paid in full.

Virginia and Her War Debt

Virginia in 1861 had a state debt of $33,000,000. At the close of the war, one-third of this debt was arbitrarily allotted by Virginia to West Virginia; but it required fifty years to end the squabbles over the subject. Virginia repudiated the interest on her debt during the Civil War and the recon-struction period. In 1892, dormant bonds to the amount of $23,000,000 were dealt with by issuing so-called century bonds, running one hundred years, in the proportion of nineteen of these bonds for twenty-eight of the old ones.

Arkansas repudiated state obliga-tions of a face value of $10,627,000 in 1880. This included $2,827,000 of bonds issued in the thirties to capital-ize banks; railroad bonds to the amount of $5,300,000; levee construction bonds of $2,000,000 and $500,000 of bonds for which the state received but $121,-336. About one-third of the repudiated bonds were issued before the Civil War. The general state debt was not denied.

Arkansas has attracted attention during recent years by litigation arising from large issues of road bonds. At one time the Federal Government sus-pended its participation in road proj-ects. Arkansas had taxable values of $589,751,692 in 1923 and a state debt of $2,499,002 or $1.38 *per capita.*

Prior to the Civil War, Louisiana and South Carolina were the most prosperous southern states and they scrupulously met their public obliga-tions.

Afflicted With Carpetbaggers

Louisiana had a state debt of twenty-three million in 1840 and had reduced it to ten million in 1861. This debt represented part of the cost of defunct banks, railroad subsidies as well as ordinary improvements. Subsequent to the Civil War, Louisiana was afflicted with a carpetbag government so bad that even a Congress shortly afterward decided the government was not the choice of the people. The carpetbag-gers increased the state debt to forty-two million notwithstanding a constitu-tional limitation of twenty-five million.

Louisiana scaled her debt to about twelve million in 1874. It was found impossible to pay interest on the re-duced debt and in 1880 it was scaled 25 per cent. New York and New Hampshire attempted to overcome the Eleventh Amendment by assuming the Louisiana bonds of their citizens and suing in the names of the states. States can sue each other in the United States Supreme Court. How-ever, the court held that this was an evasion of the Eleventh Amendment.

South Carolina had a pre-Civil War debt of $3,814,000. The carpetbaggers ran up a fantastic debt; in fact, the records were kept so loosely by them that definite figures were never ob-tainable. In 1871 a legislative com-mittee reported the debt as $29,000,000 and a taxpayers' committee estimated it at about $10,000,000. The debt was scaled to $1,126,762 in 1880.

Georgia is considered to have repu-diated about $12,700,000 of bonds and interest upon them. Practically all of these bonds were issued by the carpet-baggers for alleged subsidies to new railroads.

Alabama owed $3,445,000 upon bonds for liquidated state banks when the Civil War com-menced. Subse-quently railroad construction bonds were issued reck-lessly and state deficits were met by selling bonds. Notwithstanding the evils of the carpetbaggers the state at-tempted to carry the load. However, $25,464,470 of bonds were scaled to $12,574,379 in 1876. This included the payment in full of the entire float-ing debt of more than seven million as well as the educational debt of almost three million and a million dollars of state certificates.

Washington and the Scalawags

No apologist for state repudiation has ever attempted to explain the use of the Eleventh Amendment for this purpose by Michigan, Minnesota, Mis-sissippi, and Florida.

Some southern states regarded repu-diation of their pre-war bonds held in the North as a reprisal for the loss of the property value of their slaves, the ravages of war and the interruption of rehabilitation by the forcible imposi-tion of the detestable carpetbaggers. England and France, where many pre-war bonds of southern states were held by private persons, were wrathfully re-garded because of their failure to fulfill what were regarded as implied assur-ances that they would recognize the Confederacy. Although the southern states had a moral if not quite a legal case against the carpetbag bonds, the foreign holders of other bonds were treated pretty roughly.

In fairness to its good name the National Government could well afford impartially to determine its legal and moral responsibility for the repudiated carpetbag state bonds. Washington turned these scalawags loose on the South and maintained them by force of arms and cannot longer regard the re-pudiated bonds with both complacency and self-respect.

Romantic Rascals—No. 2

"Romeo" Coates

By CHARLES J. FINGER

Author of "Highwaymen," "In Lawless Lands," "Bushrangers," "Tales From Silver Lands," etc.

Wood blocks cut by Paul Honoré.
(Copyright, 1925, by Charles J. Finger)

THERE were many, on the island of Antigua in the West Indies, who very solemnly assured Robert Coates that his talents and qualities were such, that, once given opportunity, he would most assuredly set gigantic forces in motion and stir things up in a way that would lead to a resuscitation of gallantry and chivalry, and so on. And the young man, son of a wealthy house, believed what he was told, having always moved in an atmosphere of adulation and admiration by reason of the fact that his father, as the largest employer on the island, had the strangle hold, and was one who overtopped others because of the pedestal of power on which he stood. So his only son and heir became exalted into a kind of hero, and was clothed with prestige and enveloped in a mystic haze as it were, nor did he once suspect that his local fame could, in any way, transcend his real merit. He merely needed discovery, he thought.

Often, stretched out on the edge of a cliff and gazing over the wide sea, Master Robert dreamed dreams of England, and saw himself in London holding a world spellbound, for behind his sallow wrinkled face, too wrinkled for so young a man, wild ambition danced. There were others, he thought, who had dared, and won. Oliver Goldsmith, for instance. And Robert Burns who had left a barren farm to gain fame. And Samuel Johnson and his friend David Garrick. The last named particularly attracted the dreamer because of his conquest of the stage, for it was the theater that called the young Antiguan. Called him loudly and incessantly. Because of that, he had read with avidity every play on which he could lay his hands; the dramas of Congreve and of Wycherley, of Massinger and of Ford, and certainly all of Shakespeare. Indeed, some of the plays of the Stratford man he had by heart. More, he had acted his tragedies and his comedies, too, overcoming all obstacles by impressing mahogany-colored laborers and other impecunious hangers-on as supers; by turning negresses into leading ladies; by improvising scenery and costumes; by getting along somehow with flabbergasted actors who had never seen a theater and had to be pushed on and off stage in a state of exasperated confusion. But Coates had carried off all with his ambitious thunderings, and it counted as something that there were anxious retainers as audience, not to mention corrupt flatterers who applauded vociferously, the more, perhaps, because of Coates senior, who had a quick and dangerous eye for apathy and laxness on all occasions. So, in the Antiguan performances, tears greeted tragedy, and laughter hailed comedy, and Robert Coates seemed to distinguish himself considerably.

But the young man had other intentions than to shine in his West Indian island. For thirty years and more his heart ached for the parks and palaces and playhouses of England. For thirty years and more he secretly rebelled against a life of dullness and quiet, while yearning for things picturesque. Then relief and change came with a rush, for his father died and Robert of Antigua found himself heir to vast estates.

The dam of restriction burst the easier because, about that time, he read Sir Walter Scott's new book, "Marmion." At once there was within him a high urgency for romantic days, a kind of blood affinity for an age of fierce activity with men-at-arms, pages, archers, trumpets, armored warriors, caparisoned steeds, and crimson silken banners. For awhile he satisfied his burning soul by going about his domain a radiant figure clad in white armor and riding a black horse, while dark-skinned lads sounded fanfares, and a company of girls strewed flowers. But in a tropical climate and a fly-infested land, the wearing of steel armor is not conducive to placid peace, and, moreover, his dusky retainers viewed his doings somewhat as a dazzling parade enacted for their amusement, greeting him with laughter rather than with respect. So he turned again to his first love, looking to the stage as the proper place to whirl a falchion and fell a miscreant. Soon his decision was made, his property sold, the life of commercial prosperity abandoned, and one day he walked for the last time about his banner-hung and fragrant gardens, for the ship that was to take him to England lay in the harbor.

* * *

On fashionable Bath he descended then, becoming for a time one of the thousands taking the waters, gaming, dancing, flirting, cockfighting. But the eager soul of Robert Coates shivered in the midst of bliss. Not for him was luxury and ease, but rather the pride of dominance, the radiant ideal of eminence, the hunger for fame. Did Falkland fling away a thousand guineas in an evening at the card table? Then he, too, could be lavish and stake a little fortune on the throw of the dice. Was Beau Brummell accounted the best-dressed man in Europe? Then Robert Coates of Antigua would surpass him. So gold and silver he threw about right and left. At balls and assemblies he announced himself as The Amateur of Fashion and his extravagances thrilled an extravagant world. His entertainments were on a startling scale and cost outrageous sums. "His dress was indeed remarkable," writes Captain Grenhow in his Reminiscences and Recollections. "In the daytime he was covered, in all seasons, with enormous quantities of furs, but the evening costume in which he went to the balls made a great impression, for his buttons, as well as his knee buckles, were of diamonds." Further to astonish the world, he drove about in a curricle drawn by six horses, a vehicle shaped like a hemisphere, resplendent with silver and

gilt and scarlet, which bore on its sides the motto he had chosen: "While I live I'll crow." The further to emphasize his ideal, the strange carriage was bespangled with brass roosters, and the heads of his horses were brave with ostrich plumes.

Then one day into the orbit of Robert Coates swung the incorrigible Theodore Hook, joker, jester and society scaramouch, to whom he bared his secret soul. Hook listened with the courtesy of a Sir Lancelot while the Antiguan deplored the lack of professional talent and skill on the stage and hinted at his own remarkable histrionic genius. Never had he encountered such beautiful sympathy, such ready acceptance of his theories. Others had smiled, or had been flippant in flagrantly obvious manner when he had presented his idea of a new Romeo and Juliet, but Theodore Hook seemed tremendously attracted, even to the point of throwing out valuable suggestions.

"You mean, really, that a kind of romantic convention has taken possession of the stage," said Hook, and Coates suspected nothing of the flash of mischievous humor. "You think that present-day acting lacks honesty and originality, eh?"

"Exactly," cried the eager Coates. "For instance, an actor should be—" and he left the rest to the imagination of his hearer.

"Verisimilitude," suggested Hook, very alert and scenting sport. "I am no old-fashioned adherent to tradition. Now in Romeo and Juliet there is a duel. You would have it no child's play."

"They ought to fight like Tom Cribb," announced Coates.

"And your crowd?" pursued Hook.

"The crowd ought to come on like a mob. Pushing, yelling, fighting. I'm going to see how a crowd carries on." He pondered a moment then threw out his hands rather helplessly. "I'm weak about that. On the island we never had crowds, you know. Can't we get a crowd together somehow? Throw money into the street and let 'em scramble."

"Something of the kind might be done," said Hook, with perfect gravity. "I'll think over the matter, for art's sake."

Out of that conversation grew the Berners street affair, when half of a city was distracted while Hook and his friends sat at a window and watched the tumult they had raised, and Coates of Antigua observed the doings of an excited crowd to the end that dramatic illusion might be achieved. For the manner of the experiment made by Hook, the virtuoso in mischief, was this. To more than a thousand London tradesmen letters were sent, bidding them send or bring this, that and the other of their wares to number 34 Berners street at a specified hour. As consequence, all of one morning, there passed into the narrow thoroughfare a procession; pastry cooks with trays of confections, butchers with meat, grocers with vegetables, milliners and hatters with hats, undertakers with coffins, wagons with furniture, boys with cats and dogs and rats, vinters with wine; porters, errand boys, tailors, dressmakers, doctors, clergymen, tapsters, watermen and even high dignitaries. Nor were those who sat in exalted places spared, for the Lord Mayor of London drove there on a fool's errand, also the Chairman of the East India Company and the very dignified Duke of Gloucester, were there. Hour by hour the crowd increased, coming into the street presently by both ends so that there was congestion, and nearby streets swarmed with people pushing their way in or fighting their way out. Everywhere was din indescribable, angry voices and the noises of animals, things flung about, vehicles blundering into one another, a torrent of bewildered humanity, rough-and-tumble arguments—and all to please a practical joker with a romantic egotist who could hardly refrain from shouting from the window that he was responsible for the whole delectable entertainment.

One of the most grotesque spectacles ever seen on a stage.

At one time when the confusion in the street bade fair to become a riot, for things grew so threatening that it seemed as if it would be necessary to call the soldiery, one of the party at the window suggested flight for safety's sake. But Coates, with characteristic lack of balance flung himself into a heroic fit, and, taking a sword that hung on the wall, became a fiery Richard, leaping to the window sill and shouting:

"Our strong arms be our conscience, swords our law,
March on; join bravely; let us to't pell-mell,
If not to Heaven, then hand in hand to hell."

At last came the epic hour Coates had dreamed of, and his first appearance as Romeo was announced.

No sooner had the curtain gone up than there was an audience howling with a kind of anguish at the very appearance of the man, for, in spite of all directions, he insisted on being on the stage all the time. "His garments," writes Grenhow, "were too tight for him and his movements (Concluded on page 31)

Completing the House That Jack Built

(*Continued from page 2*)

after his shower the Japanese boy dressed him for the most part, and Jack went on reading or educating the boy, or talking to me if I were about.

"At nine, he was at his big writing table, which he did not leave, as a rule, until he had covered ten letter-size sheets with his large, flowing handwriting, his 'enormous hand,' as Mr. H. G. Wells said to me last winter in London. Those ten sheets contained, by half-past eleven or noon, one thousand words. He would not stop in the middle of a sentence; but he would lay down his stylograph midmost of a scene or movement. He had carefully figured it out, apparently, that more than one thousand finished words a day would fag his freshness, and he preferred to start afresh the next day. You see, he made a business of writing; mastered his tools so that he practically never, after he got his long swing, rewrote. His manuscripts, save for the first page or two of a story or novel, show almost no corrections. I was going over them with the curator of a great museum the other day, and he was astonished at the almost perfect condition of the entire collection.

"No, he always wrote by hand. Yes, I was his typist for a dozen years. I usually had his day's thousand words typed and laid on his desk from day to day. It did not bother him if I went in and out of the room unless I spoke to him, and I could type letters or do anything I wanted. He loved to have me practice on the Steinway during his writing-time, but did not want songs—any thing with words, which might take his attention from his composing. But very often he would call to me as I went by: 'Come, Mate—see how this is going along!' And he would read me as far as he had gone.

"The mail came about noon, and Jack liked me to get our guests seated promptly at twelve-thirty, when he would come in and join us, bright and smiling and sometimes so interested in something he had just read in the paper or a letter, that he would plunge right into his 'sharing' and often neglect his food. I do not think anyone who sat at that long, hospitable board can ever forget his entrance from the porch. He had what I call a 'merry walk,' very light-stepping, and with a slight swing of his broad shoulders that was reminiscent of the sea. He had sailor eyes; large and full and blue, dark-blue or blue-gray, with very long brown lashes and beautiful sea-bird-wing brows. His smile was irresistible.

"The afternoon was given over to play. Perhaps it would be the four-horse team that was ordered, while those who preferred the saddle flocked along behind or before the bells on the leaders as Jack tooled the quartet down or up valley, happy as a boy, under his 'Baden-Powell' hat. Or we would all ride over our mountain trails —there are miles of them, up-ravine and down-ravine and across mountain meadows.

"Dinner, or supper—we had our dinner at midday—was at six-thirty; and afterward perhaps the 'fellows' would play poker or 'red dog' or pedro. He and George Sterling played pedro for hours upon hours. The women played cards or talked, and the piano was welcomed by everyone. Usually we all went to bed in good season, for that morning's work had to be done. But there were occasional all-night sessions at poker. Jack loved a game. He did not gamble for large stakes; but he liked to play for something, if it were only a cent.

"Seldom were we at home more than a few months at a stretch, but would pack up and go on one wild goose chase or another. The morning's work was accomplished almost as regularly as at home, in Pullman drawing-room, or yacht-deck or little cabin, or on steamer or windjammer, or in little country hotels when we were out for months horseback or driving.

View of Sonoma Mountain from London home. Jack London's ashes lie buried on a spur of Sonoma.

"His great agricultural scheme on the ranch, on which he was so keen, never kept him at home. He gave orders to those who were to do his bidding, and left at short notice for the ends of the earth. He would not let things tie him down.

"There were from five to twenty-five guests in the house all the time. It was anything but a dull life. But even if there had been fewer guests or none, we should never have been bored. People with plenty of work are seldom dull. We played hard, as we worked hard.

"There is something in the rumored proposal to sell the ranch—part of it," Charmian declared. "The newspapers of course promptly instituted a sort of fire sale, indicating that I was parting from my '1,400-acre ranch.' I am considering parting with a portion of it, the object being a tremendous memorial to Jack London in the shape of a country club, with all the perquisites of golf links, polo field, swimming pool, *alfresco* theater and the like. This scheme suits me much better than selling portions to private individuals, because it will be in the nature of a widespread, universal benefit, a mecca for people from far lands. This disposition of some of the land, which is very dear to me for its association and for its intrinsic beauty, is congenial because I shall still have the run of it in a way, which I would not if it were privately controlled. My connection with it will be active.

"I am planning a European travel book from the exhaustive diary kept on my European trip. It was a joyous year, from the moment I set sail from California on a Swedish freighter, the motorship *San Francisco*, the only passenger for France, until I arrived back in New York on the *Leviathan*. The greatest joy was familiarizing myself with a very few countries—gaining a sense of neighborliness. This was made especially wonderful by the warm feeling of the visited countries toward Jack London, namely, England, Sweden, Denmark, Norway, and France. These peoples were marvelously good to me, and the press most generous. Jack's 'Iron Heel,' with a preface by Anatole France, has just come out in Paris in a 10,000 edition. My 'Book of Jack Lon-

don' is prepared for serialization in the *Revue de Paris*."

Charmian's "Log of the Snark," her best work so far, although in its ninth year, still sells in all countries in which it has been published. "Our Hawaii," renamed "Jack London and Hawaii" in England, has gone into several editions.

"I came of a writing family," Charmian replied to the usual bromide about ancestral literary tendencies. "My mother, Daisy Wiley Kittredge, was a poet and story writer. In her day—and she died very young—she contributed stories and poems more especially to the old Godey's Lady's Book. The Sacramento *Union* and newspapers in Southern California published her work. She was on the road to real success, but was cut off so early. I was then brought up by her sister, Mrs. Ninetta Eames, now Mrs. Edward B. Payne. She was also a writer, her stories, articles, and poems appearing in both eastern and western magazines. It was considered rather as a matter of course that I should write. But I wrote little—I was so much interested in music, drawing, and everything else that helped my essential joy of living. The joy of living superseded ambition, and that norm has practically always determined my life. My associations as I grew up were for the most part with writers, artists, and musicians. Of course, that meant much reading. Robert Louis Stevenson, Dickens, and Thackeray were among my favorites, and always I read much poetry. I was taught at home, and my only outside schooling was a little more than a year at Mills College, a special course that included music and drawing. There, I wrote only my expected essays, which seemed to go well. I was for a year in the old *Overland Monthly* office. I met Jack some time after I had left."

Asked what Jack London meant in her development, Charmian replied: "Jack London meant to me a tremendous development of myself in every respect. Which makes life infinitely more worth living now, without him, than it could otherwise have been. This development had little of the academic about it—it was more or less unconscious, because it was come at by means of sharing from moment to moment. Jack was a prince of sharers of everything he thought and did, from moment to moment.

"You want to know how I came to undertake the finishing of Jack's last novel? I am rather puzzled about it myself. When he died, the broken thing lay untouched for months where he had left it on his big writing table. Untouched, I mean, except when after many days I took up the still uncopied last day's work—ten pages, his inexorable daily thousand words. Then, for the last time in my life, I copied my own daily stint of his written manuscript. He had read it to me, as usual.

"The day his ashes went into the ground, and I was quite alone—more alone, it seemed to me, than I ever had been—I remember rising suddenly from my chair and going to the table with a momentary bright feeling that there was so much to do for him still—so many interrupted things to carry on; a lifetime would not be long enough. Even, perhaps, to the completing of his story as he had planned it. It hasn't worn off either, that feeling of much still to do for him. Jack was so essentially alive always, and everything he left seemed to share his aliveness. Well, in that hour I felt strongly impelled to attempt this work. There were his notes, fragmentary to be sure, but they contained a hint of his intended conclusion. Besides I had the clear memory of our many talks

The original of this cartoon of Jack London hangs in Charmian London's workshop at Glen Ellen.

about the romance of 'Cherry,' his little Japanese heroine with her extraordinary problem to work out. He intended calling his novel 'Cherry' after discarding several titles. But meantime somebody else published a 'Cherry,' and 'Eyes of Asia' is a very good name for the book.

"Yes, it all seemed quite logical then that I should go on with the weaving. But as time passed, I practically gave up the idea of doing it myself, or allowing anyone else to do it. Why? Mainly, I suppose, because I was and am so beyond-everything busy. I had published my 'Log of the Snark' before Jack died in 1916, and the next year wrote 'Our Hawaii'—from the same diary of that *Snark* adventure. After a winter in New York, resting for what was ahead of me, I began on the two-volume biography, 'The Book of Jack London.' That took me about eighteen months—with a trip to Hawaii in between. I suppose I simply got into my own work and weaned from the idea of going on with another's. Too, I believe I lost confidence.

"Now, eight years after my first intention, it came to me that the book really ought to see the light. I took the manuscript out of the safe and reread it and Jack's little note leaves, and some I had made for him. In the evening I carried the material to his table once more, snapped on his light, filled a pen or two and when I came to I found myself swinging along in short chapters, chapter by chapter.

"Oh, no—I've no notion in the world that I was being influenced by anything outside of my own brain. But my own mind is a storehouse of experiences, memories of Jack, of his work, of his methods. I didn't try to imitate his style—I merely wrote on, guided by his notes, but filling the gaps as easily as if the story were my own. One thing helped, started me off well; his last written page contained some suggested description I had given Jack at his asking, of his Japanese hero who 'plays opposite' the little Japanese heroine. And there was something else—it occurs to me at this late day that this novel is not as clearly Jack's usual style as one might expect.

"At first I tried to follow Jack's system producing a thousand words a day, but I soon found I had neither the brains nor the equipment to do it. I write when the urge comes, temperamentally if you will, quite as though I were a genius!

"Inspired? I? Oh, no. What is inspiration, anyway? Just the coming to the surface, or the correlation, of a mass of things known and laid aside—an accumulation of knowledge, much of it forgotten, that suddenly from some impetus ranges itself in some sort of order. I haven't any idea whether my work on this thing is of any particular merit—not in its abridged form in the magazine at any rate. I said I thought it seemed alive. I only hope I am right.

"I sent in my rough material to indicate what I was 'after doing.' But the editor had already made up his mind to condense Jack's manuscript into one issue and my half into the next. So I was given a limit of 5,000 words, begged for 6,000, got it, and in the end they cut out about 500, very graciously paying me for 6,500 words. Yes, they gave me, for his work and mine, the rate in Jack's five-year contract he had with them when he died, a year before it expired.

"The work of such drastic condensing was good practice, I know," Charmian laughed. "I got it into 4,800 words before I received the wire granting 6,000. It was great fun. I felt, oh, somewhat as if I were playing a sort of literary accordion!

"You asked me about book publication of this collaboration. I am expanding my half into chapters as I originally meant it should be and shall publish the result later, serially in England and in book form in all countries interested. After that I plan to write a novel of my own, which shall be semi-autobiographical."

As the Other Half Lives

By THOMAS F. LEE

Home of the lower class in the hot country, made by planting four slim posts at each corner of what is to be the one room. Small saplings join the tops.

THE Indian of the Guatemala upland is the most interesting, bizarre, colorful personage in Central America. His costume is distinctive, his home life is of unusual interest, his food, customs, superstitions, and play are peculiar to him. The whole story of the upland Indian and his "hot country" brother is the kind of human tale that is seldom written, because few visit him in his own "*pueblo.*"

The Indians are descendants of that great race which covered these countries several centuries ago and which left behind it ruins to speak of a high civilization and culture. Four hundred years of domination by the Spaniards have reduced them to a level of servility—to a social status below anything seen in our own country and yet, this is the mass of the Gautemala people.

Their homes—"*jacales*"—little huts, are crudely fashioned from small poles, sticks, palm leaves, vines and mud. The birds build more substantial and more beautiful nesting places.

The home of this lower class in the "hot country" is made by planting four slim posts at each corner of what is to be the one room. Small saplings join the tops of these posts, to which they are lashed with vines. A crude roof-tree of small poles is then set upon this framework and the roof itself is made of palm leaves overlapping, much as we construct a shingle roof. It should be stated that such roofs are waterproof and that they turn the sun while admitting the air, and that they make comfortable nesting places for scorpions, tarantulas, and centipedes.

The sides of these huts are filled in with slender poles or even cornstalks, placed horizontally and bound with vines to upright stakes. An opening is left for entrance but there is little need for windows, since the occupant of the hut may look out through any chink in the wall. Air enters freely from without and the smoke from the fire, which is generally built between stones on the dirt floor, or on a crude cooking place built up of mud and stone, finds its way out through sides or roof.

This home contains but one room in which the family eats, cooks, and sleeps and which they generously share with chickens, dogs, pigs, and ducks. The enterprising head of a family may build a thatched portico in front of his hut—a sort of antechamber or sun-parlor, as it were—and those who are well inoculated with the germ of progress will build a great mud oven outside the living room under a thatched shed of its own.

These huts, which shelter most of the poor people of these countries, are furnished with the barest necessities—one or two crude chairs or stools, a rough table set upon stilts which makes it difficult for a person seated on an ordinary chair to eat from it. The family generally sleeps on "*petates*" or mats on the floor, or in hammocks, although sometimes one finds a rude bed or litter somewhat raised from the dirt floor. Cooking utensils are limited to a few blackened earthenware bowls or "*ollas,*" but in every home is the "*metate*"—a stone slab, somewhat resembling a washboard, on which the softened corn is ground into "*masa*" with a stone rolling pin, preparatory to making the universal "*tortilla.*"

In every hut there is a little shrine with a Christ on the Cross, or with a picture of the Holy Virgin and with half-burned or burning candles set up in front of it, for in these people is a deep religious instinct, although after four hundred years they have never fully accepted the religion that Spain brought to them.

The walls of each "*jacal*" will be decorated with garish prints and discarded calendars—gifts of the local "*comerciante*" and cherished as priceless art treasures. More often than not, wild flowers will be planted about the hut, and orchids, carried from the jungle, will be hung above the door.

The item of clothing is not important. Neither custom nor climate demands much. The woman will be dressed in two garments, one a white sleeveless chemise, with a cheap cotton "*enagua*" wrapped about the waist for a skirt. She wears no shoes and when she goes to mass, a long gray "*rebosa*" is worn over the head.

In the market place, vegetables, fruits and all little articles used by the common people will be found.

The Indian market woman squats in the market place, surrounded by baskets of fruits, vegetables, pottery and woven work.

The man wears a suit of cotton pajamas, occasionally sandals and perhaps a rough straw hat. Always there is a blanket, to be used as a shawl in the cool morning and evening and as a coverlet at night. When the children are not naked, they are dressed precisely like the father or mother.

In the uplands or "*la tierra templada*," the native home is somewhat more pretentious. Many times mud is plastered in between the slats or poles, to be smoothed on the outside surface and calcimined pink, blue, or some other bright color. When this is done a window space is generally provided.

The upland Indians raise sheep, card, spin and weave the wool into blankets and heavier clothing, for the "*tierra templada*" is cool. But generally the food and home life of the hot and temperate country people are much the same. Their principal articles of diet are corn and beans. The kernels of corn are soaked in lye water over night, to soften them and to loosen the skin of the kernel. When the grain is soft, the corn is thoroughly washed to remove the skin and the lye. Then the woman of the house, taking a handful of kernels, grinds them on the "*metate*," using pretty much the same motion with a stone rolling pin that the washerwoman uses in scouring a shirt on the washboard. It is a slow, laborious task.

In Guatemala alone, probably two million pounds of corn are eaten by the people each day and the grinding of this thousand tons is mostly done on the "*metate*" by the Indian woman. When the kernels are ground to a paste called the "*masa*," the "*tortillera*" pats them into thin cakes and places them on a piece of sheet iron over a wood or charcoal fire to cook. The cakes contain nothing but corn—not even salt is added.

The other staple is black beans. These are cooked for hours, then mashed and fried with lard. The result is far more palatable than it sounds. The poor people consume quantities of lard, because it is practically their only source of fat. Add to this diet an occasional brew of coffee, an infrequent ration of eggs or meat, an occasional dish of rice, plenty of chili at all times, and as a dainty tidbit, "*tortillas*" rolled into cylinders and filled with chopped meat, grated cheese and chilis, and fruit on rare occasions (for there is a widespread notion among the lower classes that fruit is not healthful) and you have the fare which sustains at least 80 per cent of the people of these countries.

At sunup, one sees the farm laborers trooping to the fields, after a meager "*desayuno*." Some two hours later, the "*mujer*" will follow them with a basket of "*tortillas*" and "*frijoles*." In the field each woman seeks out her man, perhaps the children will have followed the mother and the family breakfast is eaten "*al fresco*." The black beans will be spread on the soft, soggy "*tortillas*," the whole mass is then rolled into a cigar shape and eaten. A workman will consume a dozen "*tortillas*" at a meal. The diet is nourishing and sustaining, for an incredible amount of exertion is put forth by these farm laborers and Indian carriers, but despite hard physical exercise one can readily understand the prevalence of sickness among a people who so persistently limit their diet to corn, beans, and lard.

Two or three days of the week, perhaps, the woman of the family may carry a few eggs, mangoes, "*aguacates*," homemade pottery or baskets, hand-woven "*huipiles*," some little article of food or wear, to some village market. All of her wares will be heaped into a wide flat basket carried on the head. The infant of the family will be swung about her shoulders in a "*rebosa*" and in her hands she may carry a half stem of bananas, a "*papaya*," or a chicken.

Left—There is much carrying of water and always on some woman's head and in a huge "*olla*," or jar. Right—Indian woman fashioning one of the large "*ollas*" which every woman uses for carrying water. Below—The Indian woman goes to market with a large flat basket on her head and usually with the baby swung about her shoulders in a shawl.

The market place is the social center of the village and the countryside. Each day it is the meeting place of the masses. Those who come to sell and those who come to buy chaffer over their trifling transactions and wring from the bargaining the last drop of enjoyment.

It seems to me that the women of this lower caste are never idle. They are always grinding corn, washing clothes, or carrying "*ollas*" of water on their heads from some distant stream.

The public wash place, whether it be the "*pila*" or the bank of some nearby stream, is another social gathering place. Here the womenfolk bring their soiled "*ropa*" and children. The washing extends from the clothing to the children, after which the women themselves take a shampoo, pour gourdfuls of water over themselves, wring out their black tresses, don dry "*blusas*" and "*enaguas*," pile the wet wash in a tray which they carry on their heads, swing the baby about their shoulders and start for home and "*tortilla*" making.

There is much carrying of water and always on some woman's head and in a huge "*olla*" or jar. Drinking water, cooking water, water for all purposes, comes from the same source and without too much regard for sanitary conditions.

The exercise of "*tortilla*" making, washing clothing, and carrying heavy jars of water on a head that must be

held erect, give the younger women of these countries a fine physical development and good carriage, but, like the women of all hot countries, they develop young and fade early. A woman may be married at twelve and a grandmother at thirty.

The market place and the wash place are the social centers and the feast day is the time of diversion. The feast day is due at least once every two weeks and in addition there is the saint's day of each individual and the saint's day should be, and generally is, fittingly celebrated. "*Aguardiente*"—the fiery rum of these countries—plays an important part in the feast-day program. The "*baile*" or dance is another invariable diversion of the holiday crowd, the "*gente*" dancing on the bare ground to the music of an accordion or cheap violin—sometimes, to the music of a marimba.

Pagan Worship of Their Ancestors

On "*El Dia de Todas Santos*—All Saints Day"—every poor family is arrayed in its best and carries at least one candle to be burned at the resting place of some relative in "*el campo santo.*" On St. John's Day, everyone bathes, probably in commemoration of the baptismal rites performed by "*San Juan Bautista.*" On feast days, one frequently meets companies of these rural people, both men and women, carrying in their midst a *papier-mache* image of the Virgin or of one of the saints, and chanting queer minor songs that have never been approved by the Vatican. Theirs is essentially the pagan worship of their ancestors, except that they have taken from the Catholic service such rites as appeal to them.

One of the surprising things in these little homes is the kindly consideration toward one another, especially the attitude of parents to children. These children may have nothing more to eat than corn and beans. They may be naked or clothed only in a tattered shirt, but they are given their full share of parent love and care. One seldom hears them cry and I have never seen one of these parents strike a child or shout at it angrily.

A Cure for the Headache

These fathers and mothers are seldom married and their offspring are listed as "natural" children. A large per cent of such offspring is, therefore, illegitimate according to our standard. The parents, however, are generally faithful to each other. The church is blamed for these unmarried unions, since it places the cost of marriage beyond the means of these people. Then, too, the woman, strangely enough, is opposed to permanent unions since the responsibility for the children's maintenance generally falls upon her and in event of the "husband's" failure to provide, she wishes to be free to discard him for one who will more adequately supply her needs.

The Indian is born, lives, and dies in the midst of superstition. His crop is planted, cultivated and harvested with many mysterious rites. When the Indian from the upland visits "*la tierra caliente,*" he places a carefully marked stone in a certain position known only to him. If the stone is undisturbed upon his return it indicates that his wife has been wholly faithful during his absence. One frequently sees the Indian or *Ladino* in the street or on the trail with a large black patch on the temple. This is a piece of dark-colored leaf and it is pasted on the forehead, to cure or prevent headache. It is a common sight to see the favorite dog of the family adorned with a necklace of dried lemons, designed to protect him from such ills as beset dog-kind. The Indian hesitates to wash hands and face in hot water.

Picturesque and Interesting

When asked why, he invariably answers, "*me hace dano*"—"to me it does harm." The moon also plays an important part in the lives of these people—planting, harvesting, nearly all farming operations are influenced by various phases of the moon. No native would think of sleeping where the moonlight could shine in his face—"*se pone loco*"—"it makes one foolish," he will tell you.

No real picture of the home life of these people can be written without speaking of their hospitality. The Indian or *Ladino* in his little "*jacal*" welcomes a traveler, divides with him the beans and "*tortillas*" and gives up his own sleeping place that the traveler may rest. This is not an act of servility—it is an impulse that I have often admired and which the centuries of subservience to his Spanish master has not crushed out.

In time, education and the things that go with it will rob Central America of the colorful life lived by 80 per cent of her present people. As transportation—highways and railways—make it possible to carry the products of these people to markets and as foreign capital comes in to unlock the unmeasured riches, higher living standards will be observed, there will be better health conditions and the ability to earn somewhat more than the day's need; but this change, much to be desired from our standpoint, will take from the country and the people much of that picture quality and human interest that now make them so fascinating.

Ambergris; Sea Treasure

AMBERGRIS is a gum-like substance obtained from the intestinal canal of the sperm whale, *Physeter macrocephalus.* This whale belongs to the toothed whales and but one species is known. When full-grown the male reaches a length of sixty or sixty-five feet, the female being much smaller. The head is shaped like an elongated wedge with the base uppermost. Its teeth fit into pits in the upper jaw when the mouth is closed. There are no teeth in the upper jaw. This whale feeds upon large cuttlefish, which its great strength and powerful under teeth enable it to dislodge from their rocky retreats at the sea bottom.

The ambergris is a fatty secretion formed in the intestines of the whale. It is taken either from certain dead whale or found floating in pieces of various sizes on the surface of the sea or washed ashore. Not long ago a man walking along a Jersey beach came upon a large lump of gray, waxy substance from which emanated a peculiarly pleasing fragrance. It proved to be ambergris and valued highly.

One prominent authority on the subject informs us that ambergris is "an essence found in the inglorious bowels of a sick whale." When the sick whale dies and his carcass decays, the ambergris is liberated and, being light enough to float, it drifts about in the ocean, or now and then washes ashore to make some finder happy. Every sperm whale does not have ambergris, only those that become ill. When first taken from the whale it has the feeling and consistency of thick grease. After exposure to the air it hardens and acquires its characteristic sweet odor.

Chemically ambergris is soluble in oils but resists acids. It dissolves readily in hot alcohol, yielding a substance termed "ambrein." As the ambrein is closely related chemically to known biliary secretions, it is further evidence that ambergris is of this nature, perhaps induced by the squids or cuttlefish, upon which the sperm whale largely feeds.

Ambergris has a high commercial value as a material for the manufacture of various perfumes, and the price is prohibitive, owing to the increasing rarity of the sperm whale and the growing demand. It is being adulterated and imitated to a great extent. A fair test of its genuineness is described as "its solubility in hot alcohol, its fragrant odor, and its uniform fatty consistence on being penetrated by a hot wire."

The sperm whale is a valuable creature, for in its head is found a chamber filled with pure, fragrant spermaceti, often barrels of it, rich with the odor of spring violets, another evidence of Nature's wonders.

The School Problem of Montreal

(*Continued from page 4*)

Montreal Jews live in the central part of the city. In this area, in September, 1924, there were 9,661 Jewish and 2,725 Protestant pupils. In the largest Protestant school in the area, the Mount Royal School, there were 43 Protestants and 1,628 Jews.

In Devonshire School there were 32 Protestants and 1,285 Jewish pupils.

In the Baron Byng High School there are at present 20 Protestants and 905 Jewish pupils.

So that it can easily be seen what an upset there is in the curriculum of the schools in this area when Jewish *fetes d'obligation* are observed.

In contrast to these figures in the French district to the east there are 44 Jewish pupils to 3,266 Protestants, while in the southwest the numbers are 48 Jews to 2,917 Protestants, and in the west 254 Jewish pupils to 2,343 Protestants.

In the Protestant schools, while every class opens with the Lord's Prayer, usually followed by a hymn and fifteen minutes' Scripture lesson, the Jewish children are not required to study or pass examinations in the Christian Scriptures. In Catholic schools no exceptions are made for Jewish pupils and all pupils must take the full Scripture course—hence none but Catholics attend them and they are free of a Jewish problem.

There were no Jewish school-teachers in the Protestant schools until 1915, when the departure of many of the teachers on Red Cross, nursing, and other war work, caused a dearth. During the absence of these teachers in the service of their country, seventy Jewish teachers were given appointments in Protestant schools and were placed in schools where the classes were almost entirely Jewish, but in the last four years this number has not been increased.

A Commission and Its Findings

The crisis that arose last year came as a result of Jewish agitation for school rights, and the Provincial government appointed a special commission on education July 31, 1924, to study the question of the education of Jewish children. This commission comprised E. W. Beatty, president of the Canadian Pacific Railway, and the chancellor of Queen's University, Kingston; Sir Arthur Currie, commander of the Canadian troops in the Great War and now principal of McGill University; the Honorable W. C. Mitchell, former Provincial treasurer, representing the Protestants, and Samuel W. Cohen, Michael Hirsch, and Joseph Schubert, representing the Jews. Their investigation resulted in three reports being submitted to the legislature, early in January—one Protestant report and two Jewish reports. The Protestants maintained that the British North America Act provided for only two school systems, one under the control of the Catholics and the other under the control of the Protestants, and that no provision has been made for any other school system.

The commission found that the cost of educating Jewish children was considerably in excess of the revenue received from the Jewish school taxes. Legal advice given the commission was that the law passed in 1903 was *ultra vires* insofar as it confers on the Jews equal rights with Protestants, depriving the Protestants of their undivided control in the administration of their schools and insofar as it compels the Protestant board of school commissioners to recognize the qualifications of Jewish teachers. Further the opinion was given that the appointment of Jews on the Protestant committee of public instruction, or advisory members of the Protestant school board would be unconstitutional.

Seeking a Way Out of It

The commission came to the conclusion that it was advisable that the 1903 act should be repealed, that the dual or separate school systems created at Confederation should be maintained and that it was not advisable to create an additional school panel. They maintained that questions of Jewish holidays, Jewish teachers, and segregation were questions of administration and as such must remain subject to the discretion and control of the Protestant board of school commissioners, and be dealt with in a spirit of equity, fairness, and toleration. They thought that some means should be provided so that non-Protestants and non-Catholics could make representations to school boards and suggested the formation of a non-denominational committee for this purpose. The two Jewish commissioners, in their report, maintained that in 1831 the Jews were given "full rights and privileges with all other subjects of His Majesty . . . and were held capable of taking, having, and enjoying any office or place of trust whatsoever within the Province." This law was not repealed at the time of Confederation, and that, as there were only two systems of education and all who differed in religious faith from the majority (Catholics) were classed as "dissentients," they therefore formed part of the Protestant school system, and were entitled to equal rights for their children with regard to school matters. They maintained that the law of 1903 was constitutional, that it was wide enough to cover the appointment of Jews to the Protestant board, and to have Jewish teachers appointed and that Jews could lawfully be appointed on the council of public instruction or as advisory members to the Protestant school board.

Alderman Schubert in his report suggested the annulment of the 1903 act, the division of the existing Protestant panel into two sections, the Protestant section to have jurisdiction over the schools where the majority of children are Christians, and the Jewish section over the schools where the majority of children are Jews, such jurisdiction to be adjusted yearly by the joint boards. He suggested the formation of a central financial board with a Jewish member, uniform taxation for school purposes, complete autonomy for every section regarding the appointment of teachers, with no discrimination or segregation, and finally that there should be no religious subjects taught in the schools before 3 p.m. but that after that hour teachers from outside could come in and give such instruction, no child to be given or lose marks on religious subjects. He recommended also that the board of education should be elected on the New Zealand plan and that there should be government subsidies for scholarships.

Faced with such divergent views the Provincial government decided to prepare a case for submission to the Court of Appeals of five judges, for a ruling on the constitutionality of the 1903 law and matters arising therefrom. On March 11, the Court of Appeals gave judgment that the 1903 law was unconstitutional, in that it permitted the appointment of Jews to the Protestant school commission, in contravention of the British North America Act, and that the latter were not bound to appoint Jewish teachers; that the legislature had no power to pass a law providing that Jews should be commissioners of the Protestant schools, members of the Protestant committee of the council of public instruction, or advisory members of those boards or similar offices.

Matter Is Left "in the Air"

The court further held that the legislature could not pass a law compelling the Protestant school board to accept Jewish teachers, but that the Protestants as a favor could permit Jewish children to attend their schools but could not be compelled so to do.

The decision of the Court of Appeals has left the matter "up in the air" so far as the Jewish population is concerned, and at the present session of the legislature a special law was passed enabling the question of Jewish rights to be carried forthwith to the Supreme Court of Canada, and to the Privy Council if desired.

As matters stand at present 13,954 Jews are being educated at the favor of the Protestant school board and subject to whatever rules and regulations they may make, while the cost of such education is being borne to a very large extent by taxes from non-Jewish sources.

Further Ideas About Intellectuals

Some of the Great Men Who Did Not Belong to This Class of People

By THOMAS L. MASSON

I COULD give here a tentative list of American intellectuals, with intelligence percentages such as they use in business concerns and colleges to determine such things. If a man were one hundred per cent intellectual, without any reservations, that would classify him as hopeless. Reservations would have to be made, and, even with this handicap, there is always a chance that a pure intellectual will reform, and become human and a useful member of society. I could give such a list, I say, but I refrain. It is not yet, as we low people say who indulge in clichés, "The psychological moment." When such a list is compiled, however, it ought to be done by a committee of two—one supreme intellectual, and one ordinary human being, who can, however, read and write. He ought to be fairly strong, able to beat up his fellow member, if necessary, but restrained enough to let his fellow member have due justice in his judgment.

At present, we know some of the "plain folks" who are not intellectuals. George Washington was not. Abraham Lincoln was not. Thomas Edison is not. Only last year Mr. Edison was put out of the intellectual class by a lot of college graduates for trying to find out whether they knew anything or not.

Only Asset of the Intellectual

I have no intention of disparaging the intellect too much. To write real words that hang together, or to do things which are worth while over a period of time, one must have some intellect to make a go. And besides, we cannot really say that the intellectuals are, after all, much worse than the rest of us. They may be much like many Congressmen, who, having tried everything else, are obliged to be Congressmen. So an intellectual has to fall back on the only asset he has—his intellect—and grub along as best he can. It is certainly unfair to stick at him too hard. He has to make a living. His pose is his purse. It is just as necessary for Mr. Mencken to poke fun at Methodists and Main Street strollers, as it is that every presidential candidate, as soon as he is nominated, should be reported as attending church services, and holding up babies at railway stations and publicly kissing them.

Some years ago I was in need of a secretary, and a young woman applied for the position. She was a graduate of one of our leading colleges. She had traveled extensively abroad both in Europe and the Orient, and spoke German, French, and, I think, Italian. I know that she was able to translate any of these three languages. She had also studied stenography and typewriting. Her father, once wealthy, had spared no expense on her education, and she came to me well recommended from a prominent man for whom she had worked. I was at first so abashed by her overpowering superiority that when I escaped from her presence at night, I was quite overcome. At the end of a short time, however, I discovered, that although she could sail all around any of us in academic knowledge, she didn't get on. She resented the office manager, whom she considered an uncultured person, and I never could count on her getting her work done. I told her finally to go, but she suddenly broke down and pleaded so hard that I suggested that perhaps a little rough treatment might do her good. In a year she became a remarkably efficient woman.

Shakespeare Was a Business Man

What was her trouble? It was quite simple. She had never learned how to work.

And that, I believe, is the trouble with so many intellectuals. Many of them are so smart that it's painful. They generally have some trick of talent, which carries them along until they finally acquire a positively uncanny skill in evading work. Along with this they get a fictitious reputation for judgment on all sorts of things of which they know nothing. Stockbrokers, if they have any sense at all, and some of them do have, will never advise a customer. "You know as much about the market as we do," they say. But a dramatic critic, who knows even less about the drama than a stockbroker does about finance, for he knows less about life, will venture an opinion about any play he sees. Practically all of the dramatic critics in New York so damned "Abie's Irish Rose" that they actually succeeded in hounding it off the stage. The fact that it is the most profitable play ever written makes no difference. They declare now that they are still right about it. This attitude might seem in itself to be quite above any material or financial consideration, were it not for the fact that the principal private conversation of a large proportion of intellectuals is taken up with how much money they are making, or hope to make. We must not blame them for that. Shakespeare was a business man, looking to the pounds, shillings, and pence.

The big men are all commonplace. When you meet a man who is abnormally bright, who has a flow of wonderful words, who is very interesting and very clever, it is generally safe to distrust him. His gift may be largely a substitute for work. It is true that many intellectuals work very hard and accomplish much, but if they succeed in the right sense, it will be found that in proportion to their success do they tone down their cleverness and rely more upon their capacity for work.

The fault does not lie with the young intellectuals themselves, with so many of them who have, since the war, come out of college and joined the intelligentsia. The fault lies with the fact that they have never been taught how to work. They, therefore, naturally fall back on what talents they have, make as much noise as possible, and hope to "get by" with it. They never get by. But many of them wake up in time to settle down to hard work.

Yes, the conversation of all intellectuals, in private life, is much the same as yours and mine. It is how to pay one's bills and how to live with one's family without committing murder or any little thing like that; of how much the doctor is charging, and how many miles one is getting to the gallon. Not so long ago I was talking with one whom I think on all counts would be considered one of our most prominent intellectuals, a friend whom I admire greatly for his superior talents and certainly his capacity for work. I asked him about his boy and he said, "He is living with some other people; he seems to like them just now." One must certainly not criticize the way others bring up their children, but somehow when I hear that intellectuals are marrying among themselves, I whisper to myself: "God help the offspring—if any."

Classics and American History

Just as we have been taking some pains to save for posterity that pure American type of animal, namely the buffalo, so we ought to start a reservation, where pure American authors can be trained. They would be permitted nothing but the classics and American history, and when traveling about seeing America they would be placed on their honor not to read anything from Paris or Petrograd. They would be asked to marry home-grown folks and permit themselves to be subjected only to American influences. Among other things, I should insist upon their learning the Constitution of the United States by heart. If they could really do this, I should consider it the right kind of a test.

Of course, such an experiment never could be tried. Mr. Munsey, Mr. Ochs, Mr. Mencken, or Mr. Patterson, of Chicago, would never approve of it.

"I Read in the Papers—"

I read in the papers that a number f writers and reviewers have been hecking up the literature of the day. ome of them have come to the conlusion that, with the exception of a few ooks, modern literature is mostly dross. 'heir diagnosis is that modern books ot only lack the power to elevate but ıe power to entertain, and that is the eason why so comparatively few read ıem. But we have still the *Bible*, and ıe *Pilgrim's Progress*, and *Shakespeare*. 'here is good sound philosophy and ndless mental nutriment in each and very one of them. But neither the ompilers of the Bible, nor Bunyan, or Shakespeare got much for their ains. There afterward came the rubb Street period of English literaıre when Oliver Goldsmith thought e was doing well to get a few pounds ır the *Vicar of Wakefield*. Then Scot nd Dickens demonstrated that forıes were to be made in writing, and) there arose a class of writers who ecame the slaves, not the masters, of ıe public taste. That is largely how matters stand today. But I have mentioned some books that never grow old.

I read in the papers that Mr. Coolidge does office work in the morning and receives people; then naps and thinks and studies in the afternoon. A sane regimen. Edward Everett Hale attributed his old age to his habit of doing no work after two in the afternoon. Beecher always napped at noonday. Emerson was through with his desk at noon, and off to the woods. We have often wondered when Presidents did their thinking, or whether they were like snap-decision business men who are eternally settling matters of which they are ignorant. Taking a subordinate's opinion, looking over a mass of stuff collated from books and reports, is not knowing anything about a subject. Knowing it is thinking over it, napping over it, walking round it, as Mr. Coolidge appears to do. Bless heaven for the disappearance of "pep" stuff from the White House, for a man who takes time to study his job.

I read in the papers that "a grave warning against the restoration of the Junker rulers in Germany is sounded by the French press. A war of revenge against France is forecast." Is there not too much talk about "revenge" in this the twentieth century of the Christian Era? But what is a Junker? and why should France or any other country feel perturbed about him? A Junker, pronounced *Yoonker*, is a young German noble or squire, frequently a member of the conservative or aristocratic party in Prussia. But the term is often used in France and England to imply overbearing haughtiness, social exclusiveness, and other things that are not in accordance with democratic ideas. But we are not living in medieval times, and feudalism cannot flourish in the atmosphere of modern enlightenment. But so long as France bares her teeth from her own side of the Rhine, so long will suppressed growls come from the other bank of the river.

Monument at Navarin Farm

By COURTENAY SAVAGE

AT NAVARIN FARM, in Champagne, the men who served with the Rainbow Division of the U. S. rmy of Occupation unveiled a monuıent last autumn.

Unveiling a monument has become ıther an ordinary procedure since the ose of the World War, but there is an nusual sentiment attached to this parcular piece of statuary. Primarily it ɔmmemorates an unforgettable comıdeship-at-arms, and is to stand at a ɔot where the French and American oops stopped the rush of the German my in July, 1918, and then, turning ıe enemy troops, sent them rushing ackward toward ultimate defeat. But) the men of the Rainbow Division, ıat glorious body of American fighters, ıe monument will mean more than ıst the commemoration of an event, ır two of the heroic figures of the ıonument have been inspired from ortraits of much loved comrades, men hose courage blazed high.

One of these much loved men is a renchman, General Gouraud, the other real American boy, Lieutenant Quenn Roosevelt, the youngest son of the te Theodore Roosevelt. It was Gen·al Gouraud who commanded the ɔmbined French and American forces hen the tide of the Champagne offenve was turned from defeat into vicɔry. The men of the Rainbow Divion fought under the leadership of the eneral, and they learned to love him. e was a true soldier, and an empty eeve and a mechanical leg bear mute stimony to his work on the battle front. Many an authority has called General Gouraud the most loved soldier of France, and as the governor-general of Paris he quickly became the idol of the city. A year ago he visited the United States as the guest of the Rainbow Division, and also attended the convention of the American Legion. It was during this visit that the men who fought under Gouraud's leadership informed him that the monument was to be placed at Navarin Farm, and that he, the General, had inspired one of the figures.

A photograph of the monument at Navarin Farm in Champagne. General Gouraud is shown with Maxime Real del Sarte, the sculptor. General Gouraud inspired the figure of the veteran Frenchman about to throw a grenade, while the figure of the "doughboy" was inspired by Lieutenant Quentin Roosevelt, son of the immortal "Teddy." Quentin, it will be remembered, died in service.

The choosing of the figure of Quentin Roosevelt to represent the young American infantryman, was partly due to the regard with which General Gouraud regarded young Roosevelt, and partly because Maxime Real del Sarte, the sculptor, felt that Quentin Roosevelt was what might be termed a "typical American soldier." Those who knew Lieutenant Quentin Roosevelt in the days before his heroic death for his country have spoken of him as having all the courage that made his father famous as the leader of the Rough Riders during the Spanish-American War. When General Gouraud was in the United States he went to Oyster Bay to call on Mrs. Theodore Roosevelt, Quentin's mother, and together they chose the photographs that were used by the sculptor.

The monument as it is finished represents a veteran French soldier with a bag and hands filled with grenades, flanked by a young French infantryman, determination carved in every line, and an American, eager for the fray, the youthful zeal, courage and curiosity of the American troops personified in his attitude. General Gouraud inspired the figure of the veteran Frenchman, and Lieutenant Roosevelt the American.

Regarding Philosophy

(*Continued from page 7*)

Diogenes came into Plato's school in the midst of a lecture. Plato was at the moment using the terms "tableness" and "cupness," in dealing, probably, with objects as figments of consciousness.

"I see a table and a cup," Diogenes interrupted the author of the "Republic," "but I see no tableness or cupness."

"That is natural enough," Plato replied, "for you have eyes, by which a table or a cup may be seen; but you have not intellect, by which tableness and cupness are perceived."

Undoubtedly the students applauded, but, if the writer has his say, we shall not echo their applause. For here is illustrated perfectly Plato's tendency to carry philosophy into a world inhabited by the ghosts of words, and Diogenes' determination to retain it as an active force in the world of living men. This "intellectual" perception of qualities, apart from the objects which they characterize, is at the root of philosophy's remoteness from life at the present day.

Plato defined man as "a two-footed, featherless animal," and was much praised for the definition. But Diogenes removed the feathers from a cock and brought it into Plato's school, saying, as he displayed it, "Here is Plato's man."

Diogenes Goes to School

Plato then added to the definition the words, "with broad, flat nails."

Diogenes was a native of Sinope, from which city he was banished, it is said, for adulterating the coinage. He came to Athens and attached himself to a sage named Antisthenes. The latter tried at first to drive him away with a stick; but when Diogenes told him that no stick was hard enough to discourage him as long as Antisthenes retained his power of speech, the sage allowed him to remain as a pupil.

"Being an exile," says Diogenes Laertius, "he naturally betook himself to a simple mode of life." He carried his food about in a wallet, and ate it wherever he happened to become hungry. Sometimes he slept in a cask which he found in the Temple of Cybele, at other times in the Colonnade of Jupiter or the Public Magazine. He used to point to these latter places, saying that the Athenians had gone to great lengths in providing him with places in which to live. And because he could not regulate the temperature of his dwellings according to the season, he trained himself to endure all temperatures, rolling himself in the sand during hot weather, and in winter embracing statues covered with snow. It is said that he learned his mode of living from a stray mouse.

Diogenes used to say that when he beheld pilots, physicians, and philosophers, he thought man the wisest of all animals; but that when he observed interpreters of dreams, and soothsayers, and those who listened to them, and men puffed up with glory and riches, he thought that there was not in the whole world a more foolish animal than man.

He used to express astonishment at the grammarians for being anxious to learn all about the misfortunes of Ulysses, while remaining ignorant of their own, and he marveled that musicians should be so careful in stringing their lyres, while leaving all the habits of their souls ill-arranged.

There Were Good Boys in Sparta

When some fat citizen asked him where one could find virtuous men in Greece, Diogenes answered, "Nowhere, but there are good boys in Sparta."

Alexander the Great once visited him and told him: "Ask any favor you choose of me."

Diogenes answered: "Cease to shade me from the sun."

One day a noisy fellow was reading an interminable manuscript in Diogenes' presence. At last he came to the final paragraph; the blank space beneath showed that the tale must soon be finished. "Be of good cheer, my friends," Diogenes called to the assemblage; "I see land!"

On one occasion a disciple of Zeno was proving to him that there was no such thing as motion. Diogenes walked away.

While he was eating, some mice crept up to his table. "See," said Diogenes, "even Diogenes maintains his favorites."

He was a great traveler. While passing through a certain province, he saw some sheep carefully covered with skins, while the children ran about naked. Afterward he commented on this: "It is better at Megara to be a man's ram than his son."

He had no great faith in the virtue of politicians. One day he saw some parliamentary secretaries leading to prison a steward who had stolen a cup. "The great thieves are carrying off the little thief," said Diogenes.

The Man Who Played the Harp

When he was well along in years, some people said to him: "You are an old man, and should rest for the remainder of your days."

"Why so?" Diogenes asked in reply. "Suppose I had run a long distance; ought I to stop when I was near the end, and not rather press on?"

One day, at a concert, all the people present were deriding an indifferent harp-player. Diogenes alone praised him.

"He plays wretchedly!" someone exclaimed to the philosopher. "Why do you praise him?"

"Because, though he is such as he is," Diogenes replied, "he plays the harp and does not steal."

Chancing to meet on the street a vocal artist who should have known better, Diogenes greeted him: "Good morning, cock."

"Why do you call me that?" the incorrigible tenor inquired curiously.

"Because when you sing," Diogenes informed him, "you make everybody get up."

Of people who were alarmed at dreams, Diogenes said that they did not regard the acts of their waking hours as important, but made a great deal of fuss about the fanciful things they saw in their sleep.

Once he came upon a man who was washing, not for physical reasons, but in accordance with some religious prescription, and said to him: "Do not you know that, as you cannot wash away blunders in grammar by purification, neither can you by that means efface the errors of a life?"

A superstitious man once said to him: "With one blow I will break your head."

Eating and Bathing

"And with one sneeze I will make you tremble," replied Diogenes.

He used to ridicule those who sacrificed to the gods to procure good health and at the sacrificial feast ate in a manner injurious to health.

At a bath which was not in a very sanitary condition, he mused: "I wonder where those who bathe here cleanse themselves?"

Some soiled loaves were set before him during a meal in a temple; and Diogenes carried them to the door and threw them out, saying that nothing unclean should be allowed to enter the temple.

Journeying on foot—as he always did—from Sparta to Athens, he was met by an Athenian, who asked him where he was going, and whence he came.

"I am going from the men's apartments to the women's," answered Diogenes.

Someone sneered at him for having been banished—"The people of Sinope condemned you to banishment."

"And I condemned them to remain where they were," Diogenes answered.

"You were banished for tampering with the coinage," he was told by some good nosey gossip.

"There was a time when I was such a man as you are now," Diogenes enlightened his accuser, "but there never was a time when you were such as I am now, and never will be."

In his travels he came to a city which was very small, but whose gates were very large. "O men of

yndus," Diogenes cried, "shut your ates, lest your city should steal out!"

And in general it was his delight o put pretense and miserliness to ame, wherever he found them, and y whatever means he could at the oment devise. When the Athenians egan, because of his eating in public, r wherever he happened to be hungry, o call him a dog, he accepted the title nd made use of it in rebuking the ults of his fellows.

Once he observed two young beowdered sheiks giving him a wide erth. "Have no fear, my boys," he ssured them; "a dog does not eat beet-oot."

While he was on his way to Aegina, iogenes was captured by pirates and ken to a port to be sold as a slave. he auctioneer had no idea of what iogenes' attainments might be, and sked the philosopher what he could do.

Diogenes answered: "Govern men."

And to the auctioneer's astonishent, he continued: "If there is a man ere who needs a master, tell him that ere is one here for him."

"Stand up!" shouted the auctioneer.

"Tush!" Diogenes jeered, "fish are old, be where they may."

At this juncture, Xeniades, a wealthy orinthian, who may have recognized Diogenes, bought him cheaply, at whatever price. During the whole journey to the home f Xeniades, Diogenes expatiated to is owner on the reasons why the tter should obey him. Physicians, ilots, and philosophers, Diogenes exlained, should always be obeyed, for ny other arrangement would be ridiculous. Xeniades listened in respectful ood humor, and no doubt often lessed the chance that had carried iogenes into his possession.

Everything to Be Topsy-Turvy

At Corinth, Xeniades made Diognes the tutor of his two sons. Acording to Diogenes Laertius, the phiosopher taught the sons of Xeniades implicity of life and clarity of thought, nd went personally with them to versee their exercises in the gymasium. He would allow them none f the violent practices of the athletes, ut saw that they exerted themselves o as to insure a balanced development f their muscles and good health. Ie went also with them into the woods nd fields, instructing them in the arts hat serve men in hunting and war. nd in the course of this activity he o endeared himself to the sons of eniades that, at his death, they inisted that they be allowed to bury im with their own hands.

The writer cannot remember the ause of Diogenes' death. However, hen it became known that he would oon die, Xeniades, to whom the hilosopher had become as dear as is sons, asked Diogenes how he would ke to be buried.

"On my face," Diogenes replied.

And being asked why he wished to lie in this strange position, he explained: "Everything will soon be topsy-turvy anyway."

His saying was remembered when, not long after his death, the armies of Alexander descended on the rest of the Grecian world and did indeed turn things upside down.

A Monument to the Wise Diogenes

He requested, according to one story, that he should not be buried, but that his body should be thrown into a ditch, and some dust sprinkled on it. But most accounts say that the people of Corinth fought over his body, for everyone wished to have a part in burying it, and that finally the sons of Xeniades were allowed the honor, as having the best right. So the rest of the citizens had to content themselves with erecting on the grave the image of a noble dog in Parian marble, and with other monuments inscribed with expressions of their admiration and love for "the wise Diogenes."

It may be that these notes, especially those regarding Diogenes, are already over-familiar to the reader. The writer cannot say as much on his part. Out of a ten months' Ancient History course he remembers no word concerning Diogenes. Somewhere or other he has seen a picture of Alexander standing before Diogenes' tub in Corinth—or perhaps his cask in Athens. And of course the cartoonists never allow us to forget Diogenes' search for the honest man.

But, say these remarks *are* familiar; it is surely a good time to repeat them; for recognized philosophers are today pursuing, with renewed determination, the course on which Plato lost his way.

Yesterday the writer picked up a newly translated work by Benedetto Croce, the Italian thinker. The jacket declared this book to be a discussion of the problems which arise in the daily life of men—a philosophical work in the literal sense of the word. Yet, reading it, one felt that the author was viewing life from a library window on which the frost had gathered. One found none of the wit, the low-down comprehension, the directness, which one finds in the words of Diogenes. Our painters are said to be acquiring these qualities; our writers are surely acquiring them, even though the process is painful and slow; it remains for the philosophers to turn and follow them . . . Or does it? On second thought, it is doubtful. Only, let's remember Diogenes and expect to find our philosophy, not among those who are professionally known as philosophers, but among the cobblers and tailors, the comedians and satirists, the Charlie Chaplins, the Ring Lardners, the Finley Peter Dunnes. For these are the *real* philosophers of our day, even as the wise Diogenes was the real philosopher of that time when philosophy was young.

Should Not Congress Stop Wasting?

(*Concluded from page 3*)

other than the president of a corporation dealing in builders' materials. They called it patriotism—civic pride. What was it? Mostly a brazen attempt to connect their own bank accounts with the public treasury. These same gentlemen, however, cry out against high taxation.

Put the government upon a proper basis and there need be no income tax.

If you want taxation reduced, you must stop wasting before you can begin saving. You must watch how your Congressmen vote and regulate your own vote accordingly. Give the air to gentlemen who squander public money right and left and then tell you to pay the bill. Haul them home.

Shout Aloud Your Grievances

A good way to begin is to form the habit of writing letters to your local newspapers. Tell your editor what is on your mind. Base each letter upon some specific act of Congress or of your Representative in Congress. Bawl them out. Let your editor know that you are wise to the workings of the income tax. Make it plain that your employer would have more money with which to pay you for your work if he did not have to dump so much into the Treasury at Washington. Say that it hurts everybody, including yourself, to have hundreds of millions annually withdrawn from industry and sent down to Washington to be wasted.

You may not think such letters count. You are wrong. Go down to Washington and look into the offices of Representatives and Senators. In each of these offices you will find files of their home papers. They watch these papers like hawks. So long as these papers contain nothing much except routine local news and social gossip they know that whatever murder they are getting away with is going unnoticed. In other words, they know that you are asleep. But when you begin to howl, they begin to prick up their ears. And when you howl they multiply your voice by at least fifty. They figure that one man who rushes into print means the existence of at least forty-nine others who feel the same way, but are too indolent to write. You get great action on your ink when you use it to write to your local editor about the shortcomings of your Congressman. If a few others begin spattering him from the same kind of an inkpot it will not be long before he will be gravely telling Congress that "my constituents are unalterably opposed" to whatever you and our fellow townsmen have been panning in the local press.

Do not rest until you have ended the income tax.

It has done nothing that its advocates said it would do.

Land of the Vikings in Summer

Norway, Where the Sun Shines at Midnight, and Peer Gynt Played His Pranks

By JULIUS MORITZEN

MUCH has been made of Norway as a country of winter sports, with the ski-runner displaying a proficiency in daring that has won the admiration of all lovers of out-of-doors. But to see this land of mountains and fjords and interspersed lowland, with its frugal people, at its best you must perforce make the visit a matter of the summer months. Then there will be revealed a picture well-nigh unapproachable in its silent majesty. Seldom do Nature's beauties blend more fittingly than along the coast of Norway when the summer sun casts its glow on sky and land and water.

It matters little where you turn your steps in this country of grand proportions, for everywhere outside the cities it is Nature at her best that meets the gaze. Take the Laeredal Valley, for instance. Notice the raging torrent seeking its way to the open sea, a slender bridge from rock to rock proving the only means for negotiating the distance between. How bleak, and yet how impressive is this picture; in the distance the pine-clad mountains furnishing relief to the eye, while still further back imagination can feed on legends such as made this the country where Ibsen's Peer Gynt played his pranks among the simple folk of the land.

Or again, we have a scene where on the shore of the fjord, where it touches the mainland, two women are standing in quiet contemplation. May it not be that here they are waiting the return of their sturdy breadwinners, out on the open sea where the teeming denizens of the deep are their only sustenance when caught?

And then again, observe in another place along that matchless shore, with the snow-capped mountains in the far distance, the lone fisherman dragging his boat on land, his day's work apparently at an end, while just back from the water perhaps his helpmate awaits his coming, all prepared with the evening meal that is his reward for a day of heavy toil. How calm and peaceful it seems, while, just beyond, the sea may at the very instant roar angrily as the waves dash against the rocks.

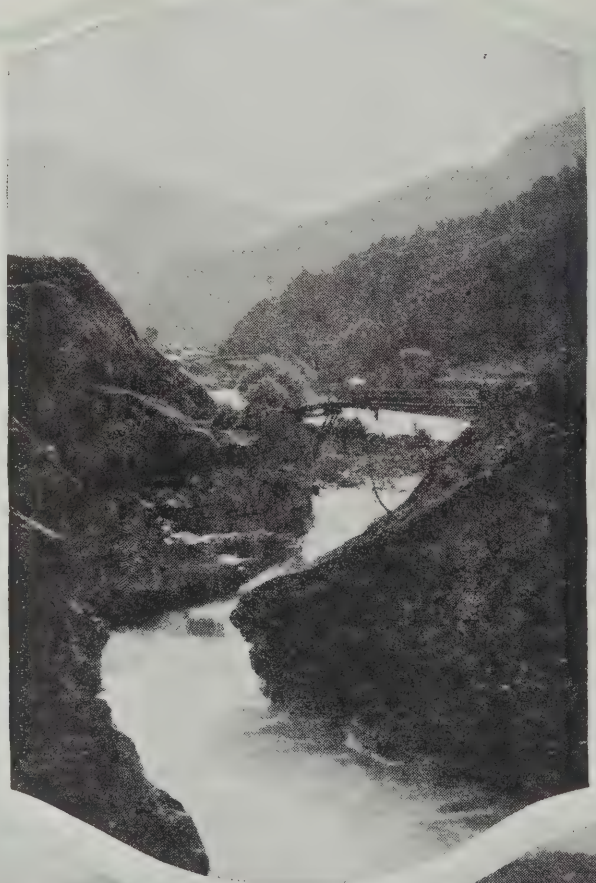
The attachment of the Norwegian to the land in which he was born is one of the most noticeable national characteristics. If a family become impoverished and are compelled to sell their homestead, they have three years' grace to buy it back, and if a man should die without a will his landed estate is not cut up into small parcels or sold to strangers. The eldest son, the recognized head of the family, is permitted to retain it intact by offering equitable compensation to the other heirs.

Norway has the same flowers that we have in the northern part of the United States, only they appear larger, fuller and more brilliant in color. Botanists say this is accounted for by the long days. The flower season is short but luxuriant. Twenty hours of sunshine makes a difference. The fields are crimson with sweet-smelling clover. The great stone fences are covered with the wild roses which climb and spread farther each year.

In the numerous gorges, streams, waterfalls, forests, and roadways of Norway, one sees many striking resemblances to our own American Rockies. The ice age in this country lasted millions of years, during which time the glaciers were carving the rocky crust into mountain peaks, lakes, and fjords. The fjords are extremely deep and the largest steamers afloat may tie up directly to the rocks if they so desire. There are hundreds of lakes, the largest being sixty miles in length and the highest 4,800 feet above the sea.

It is the variableness of the Norwegian landscape which is one of its greatest charms. In the present instance the eye has caught but the gentler moods of that Northland nature, but when contrasted to what obtains when snow and ice abound, in later months, it leaves an impression on the mind that is lasting in its calm beauty.

"Waiting the return of their sturdy breadwinners."



"The raging torrent seeking its way to the open sea."

"Variableness of Norwegian landscape."

When Bugs Sit for Their Portraits

Miss Esther Hastings Hart Unites Her Art to Science

By S. R. WINTERS

THE *Ditropinotus aureovirilis* has been put down on paper in black and white! Another animal or dinosaur, which inhabited the earth thousands of years ago, you inquire. No, this formidable name represents a bug or insect, and contrary to most bugs, it is useful to mankind. That is, it preys upon the Hessian fly, which is so injurious to our wheat crop. For this reason, it is classified as a beneficial parasite.

Useful insects, as well as destructive bugs, have to be placed on record and means devised for identifying them at any time. Or, in the slang of the street, it is necessary to "get their number." It fell to the lot of Miss Esther Hastings Hart, insect delineator of the Bureau of Entomology, United States Department of Agriculture, to make pen and ink drawings of the *Ditropinotus aureovirilis*. That is to say, she has faithfully sketched this beneficial parasite for reproduction in a bulletin or other form of publication for identification in making a scientific study of this foe to the Hessian fly.

(C) Harris & Ewing

MISS ESTHER HASTINGS HART,
Insect delineator.

This is only one of the hundreds of bugs which Miss Hart has made drawings of during her twelve years of continuous service with the Bureau of Entomology. She sketches insects ranging in size from a speck of dirt, not visible to the naked eye, to bugs measuring several inches in length. These figured representations not only include beneficial parasites but members of the insect family, which exact a toll of millions of dollars annually of forage and staple crops in the United States. The importance of drawing these bugs true to their respective characteristics is obvious, since they are to be identified and combated through their representations in sketch and text.

For instance, two species of insects may be distinguished only by the slight variations in the lines representing the bodies of the bugs. If they are not brought out faithfully with pen and ink, insects of different habits and varying degrees of crop-ravaging tendencies may be confused. Such an error, it is not difficult to see, may be costly to the farmers whose wheat, corn or other crops are being invaded by a bug whose identity is not readily determined. For instance, the Bureau of Entomology has imported a beneficial parasite from Europe for the purpose of arresting the depredations of the corn borer, a pest that is proving so damaging to this important crop in certain sections. Clearly, it would be a grievous mistake for farmers to destroy the imported useful insect. Knowledge, through drawings and descriptive text, makes it possible to avoid such an error.

The task of an insect delineator requires infinite patience, and even then the precision demanded must be nerve-racking, indeed. Miss Hart, for example, is seated at a table for hours, and with intermissions, weeks, and even years. With pen and ink at hand, and peering through a microscope, she may be engaged in sketching an insect so small that it can rest comfortably on the head of a pin. A period of two weeks may be necessary for drawing one insect. So exacting is this work, that the hairs on the wings of different bugs may vary and this variation must be shown on the sketch. Moreover, the spines on the legs of a parasite must be revealed, and thousands of dots may be made in a small space in representing the wing of an insect.

Esther Hastings Hart is a native of Elmira, New York. She was graduated from Elmira College and later pursued studies at the Cooper Institute of New York City. A dozen years is a long time to follow the fortunes of bugs, figuratively speaking, but the value of this work is not to be discounted. The significance attached to the title of insect delineator (and Miss Hart is the oldest in point of service in the Bureau of Entomology) is suggested by the fact that the head of this section of the Bureau of Entomology, W. R. Walton, began his service in this very capacity.

The lesson that the writer learned from observing this woman insect delineator at work is the patience involved and how well Miss Hart meets these exacting requirements. Persons who are prone to complain that their jobs are so confining and burdened with so many details, when they may be comparatively easy, should visit the room in which this government worker toils day after day. For a time, at least, their duties would be relieved of some of their drudgery and they would doubtless renew their task with fresh inspiration and a high resolve to dedicate themselves anew to the work at hand.

Menace of Gold Standard in Britain

(*Concluded from page 8*)

ment boom in Wall Street had gone too far, or because of a sudden change of fashions toward foreign bond issues, or because the banks in the Middle West had got tied up with their farmers, or because manufacturers of motor cars or wireless sets suddenly realized that people were over-supplied with those useful articles."

It is generally recognized that the group scheming for the restoration of the gold standard here is a unit on the conviction that without such restoration it is hopeless for Britain to hope to regain its long held position of the world's great creditor nation and to make Lombard Street once again the world's financial center, able to dictate terms in peace or war to the rest of the earth. By the reinstitution of the gold currency and the actual circulation of golden sovereigns and half-sovereigns, it is pointed out, British banks—meaning the Bank of England—would be in a position to profit at the expense of other countries by calling in such coins should an emergency arise as in 1914.

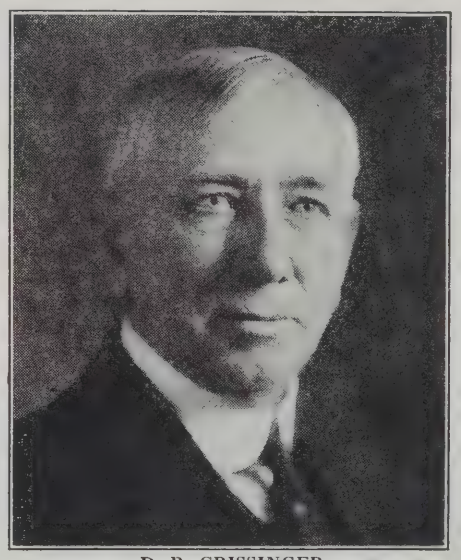
Logic goes by the board in much of the argument, as for instance when the *Daily Express*, which is making a vigorous show of opposing the return to the gold standard in the interest of British trade, declares: "America is naturally anxious that the gold standard should be restored in Great Britain. Before the war America had £300,000,000 of gold. Now she has nearly £1,000,000,000. It is therefore to America's advantage to *make gold more valuable*. That object would be achieved by restoring the gold standard in Great Britain. The interests of British industry would then be dragged at the heels of the American banks."

It is yet too early to speak of actual results of the bank rate increase. There was the natural and foreseen advance in gilt-edged securities, but it has been plain during the past week that a 5 per cent bank rate is not sufficiently stiff to check speculative activities, so long as monetary accommodation is forthcoming. As a matter of fact, money has been available in liberal quantity at the joint-stock banks at from 3½ to 4½ per cent on good mercantile notes.

The Richest Country in the World

So far, the Bank's action seems to be regarded as of a merely precautionary character designed to check withdrawals of money from England for American account. It is suggested also by apologists for the Bank's policy that a 5 per cent bank rate should not necessitate any undue restriction on credit nor retard recovery in trade, so long as monetary accommodation is available. What traders and manufacturers are worrying about is not so much an extra charge of one per cent for loans, but the possibility of being refused assistance at any price.

It is curious to find spokesmen of every party stressing the aspect of the situation that subordinates England's financial dominance to that of America—and despite all the "hands across the sea" business, much anti-American feeling of a nasty sort crops out.



D. R. CRISSINGER,
New Controller of Currency.

Bonds That Cannot Be Collected

(*Concluded from page 15*)

The plea, made long after their proceeds were either spent or dissipated, that many of the repudiated state bonds issued before the Civil War had technical flaws, is what the courts term a stale case. The time to protest such bonds was when they were issued. The state courts were then open to any taxpayers who thought there was something wrong.

However, the purpose of this article is to indicate the singular position in which the country has been placed through the ability of the states to repudiate their bonds without submitting to the decencies of a judicial inquiry. We proudly declare that this is a government of laws and not of men. Unfortunately the owners of state bonds must look for their security, during the coming years, to the whims of politicians because the Eleventh Amendment closes the doors of the courts to them.

The facts presented in this article constitute additional, compelling reasons for a scientific overhauling of the whole present system of public financing. Every additional bond issue upon the present basis means just that much more trouble for the future.

We have, for instance, Emil Davies an Alderman of the London County Council and regarded in Socialis circles as a financial expert of hig authority, telling the Fabian Society in a lecture on "America Revisited," that "the recent presidential electio represented the triumph of materia ism, big business having concentrate on the defeat of the one candidate wh was hostile to it." He went on "The United States is now the riches country in the world, but this i due not so much to any merit of it inhabitants as to the vastness of it resources, which these same inhabit ants are gutting a fast as they car The war has turne America from debtor to a creditc nation, and in the last year American have taken over £250,000,000 worth European loans.

Vassals of Wall Street

"Whether we like it or not," h said, "Europe is becoming pawned t America!"

Sir Josiah Stamp, an able econ mist and Liberal member of Parliamen is out in *The Times* in a letter of stron protest against the policy indicate by the rise in the bank rate of di count. In the *New Leader*, a brig Socialist weekly edited by H. N Brailsford, it is pointed out that "t monetary policy which every comp tent economist should advocate is, course, to regulate the price a volume of credit in such a way as keep the general level of prices stead As there is no evidence of any su boom in business as would necessari call for a contraction of loans, the reas for the rise is based solely on our r lations with America, and on *the wish bankers* to return without delay to t gold standard. The effect will i evitably be to push industry back su denly into the valley of depression o of which it was slowly groping its wa This must mean, if not an increase unemployment, at least a check to a hope of improvement. Bankers a autocrats, but are these autocrats th own masters? They act like vassals Wall Street."

Europe is in pawn, not to Ameri or Americans, but to the same int national banking ring that today closing on the whole world's financ machinery and resources, and wi that on its industries, its commer its politics and its whole social fabr Wall Street controls the banks of N York, the banks of New York dor nate the banks of the whole coun through Paul Warburg's Federal R serve Board, while the agricultural a the manufacturing industries of te country are dependent on the lo banks.

(*Concluding installment follows n next issue.*)

Your Friend the Toad

(*Concluded from page 5*)

a toad. Young toads have a smooth skin, but as they grow older the warts begin to appear. Even today the country boy will tell you that you will get warts if you pick up a toad. As a matter of fact that toad has poison glands from which a poison is secreted, but this poison is not harmful to man. It is really an acid, which irritates the membranes of the mouth of any animal trying to eat a toad. A dog will never touch a toad but once in his life, because he remembers the bitter taste of the creature. Skunks eat toads, but it is said that they roll the toad over and over before eating it so that the poison will have been rubbed off in the grass. Large birds of prey and snakes eat toads, apparently without minding the bitterness of the "poison." Ducks, chickens, and guinea fowls eat the young hop-toads they encounter, but these young toads are naturally not endowed with the same protective powers as are the adults.

Toads live for many years. There have been frequent examples of toads living in a garden for more than thirty years, and so great is the homing instinct that if one is picked up and carried away from its place of regular habitation it will, unless the distance is too great, promptly hop back when released. No cat nor carrier pigeon has a greater homing instinct. It is believed by scientists who have studied the habits of the toad that it always returns to the pond where it was hatched to mate, and that it also returns year after year to the same shelter and the same feeding ground.

While the toad is chiefly terrestrial, it is often found near, and even in, shallow pools or streams. When it comes to eating, the toad is distinctly a creature of prey. Dead or motionless food holds no interest, but if the object of attack is moving the toad will eat any insect it can swallow. The tongue is its instrument of attack, and this tongue is attached to the front of the mouth, and free behind. In this way it is flung forward, and the object of the attack is quickly carried back into the mouth, practically into the very throat. The tongue of the toad is covered with a sticky coating, and this coating holds the insect fast. Sometimes when the insect is too large to be swallowed comfortably the toad will use the front feet as an aid to pushing it down its throat.

The Toad's Fine Flytrap

Another peculiarity of the toad is the fact that it sheds its coat several times a year. When it is time for the old coat to split the toad goes off by itself, and if the skin does not peel off easily, it uses its front legs to hasten the operation. When the skin is off the toad frequently eats it.

Unfortunately the helpful and interesting toad is not so common in the fields and gardens as formerly. Today, in some sections, toads are becoming very rare. Droughts in summer and severe cold winters kill them off, this being caused by the fact that young toads do not burrow deep enough. The enemies of the toad make their presence felt at every stage of the animal's career. A water beetle will eat a couple of thousand toad eggs in a single day, and newts, salamanders, and fishes also eat the eggs. The sudden drying up of a pond will kill hundreds of tadpoles. When Johnny hop-toad is ready to leave the pond for dry land he finds plenty of enemies. Along the country roads the toads are killed by passing vehicles. The barnyard fowls eat young toads, and hawks, owls, snakes, crows, and skunks eat the older ones. The burning over of a field or patch of woodland always kills off a great number.

No More Maligned Creature

Then, too, it is unfortunately true that small boys, and even adults, kill toads with a sense of performing a necessary duty. There is probably no more maligned creature on earth. Being unattractive, the toad has become the object of curious beliefs that have had their foundation only in man's imagination. For ages the story that a toad produced warts, if the creature was handled, has been firmly believed. Small boys will tell you that if you kill a toad and turn it on its back it will rain before night. The country woman will say that a toad can poison an infant with its breath. Other prevalent superstitions are that if a cow steps on a toad while returning from pasture, the cow will go dry; it brings good fortune to a new house if a toad is found in the cellar; a child can be cured of stammering if a toad is rubbed on the back of the child's neck. These are general superstitions. There are others more local in character.

However, in spite of natural enemies and man's imaginings, there is small likelihood of the toad disappearing from the woods and fields of this country. Agriculturists and students of conservation and economics are fully aware of the value of the toad, and know that toads must be kept in abundance. While the adult toad will hop away from a strange locality, the young toad emerging from the pond in which he was hatched soon makes the locality his own, and stays there as long as he lives. In Europe the farmers have been buying toad eggs and bringing toads to their locality. The plan will doubtless be adopted in this country.

The friendly toad! It seems a misnomer to those who do not realize the fact that they err in making that toad an object of aversion; who do not realize that the toad should be classed as a friend to man.

Romantic Rascals, No. 2

(*Concluded from page 17*)

appeared so incongruous that every time he raised an arm or moved a limb it was impossible to refrain from laughter. . . His dress was *outre* in the extreme; whether Spanish, Italian or English, no one could say; it was like nothing ever worn. In a cloak of sky-blue silk, profusely spangled, red pantaloons, a vest of white muslin, surmounted by an enormously thick cravat, and a wig *a la* Charles II, capped by an opera hat, he produced one of the most grotesque spectacles ever seen on the stage."

As for the acting, it was claptrap and boisterous energy, with "Romeo" Coates vulgarizing every scene, offering Juliet his snuffbox, yet going through it all without the least comedic intention; mouthing his lines with peculiar mechanical cadence, racketing and swaggering, bounding about the stage in an extravagance of caricature, collapsing tragically at every pathetic utterance of Juliet, capering and urging the actors in the duel scene like a man at a cockpit, talking of the Capulet-Montague feud in terms of the prize ring. In the tomb of the Capulets he conducted himself so uproariously that the audience encored ironically, and three times in succession he enacted the death scene, until the dead Juliet rose up and put an end to the affair by advancing to the footlights and saying:

"Dying is such sweet sorrow,
That he will die again tomorrow,"

while the house roared again with diabolically boisterous laughter.

Next day his name was all over London and "Romeo" Coates, quite unconscious of the ludicrous figure he had cut, but believing all to have been effective and ingenious, arrayed himself in silk and diamonds and betook himself in a sedan chair to wait upon the king at Carlton House, to find, on his arrival there, that the invitation was a forgery concocted by Theodore Hook.

The Sad End of "Romeo" Coates

For a time London accepted "Romeo" Coates as a tremendous joke and paid its good coin to deride, but soon tired of and forgot its clown. There was a brief acceptance of him in Boulogne, then he dropped out of sight. Nor was he heard of until the year 1848 when he was moved to receive the admiration and applause of men by seeking leadership in the Chartist cause which was to spread serenity over the world. But while crossing a London street near Covent Garden, he was crushed between his own carriage and another, and died at his home in Montague street.

Half-Timbered Houses of France

Quaint and Curious Structures That Have Defied the Ravages of Time

By BRANDER DE RENNES

THE half-timbered house originated in France, and the Elizabethans copied it for their English manor houses. This French system of framework was called *pau de bois*, and was a definite new note in architecture five hundred years ago. In *pau de bois* the constructional timbers were left exposed and the interstices filled in with plaster, and the imagination of the early builders ran riot in novelty, resulting in a wide variety of styles in this type of house or building, many wonderful examples of which are to be found scattered about France and showing beauty in their age.

In England, however, this flexibility of the imagination was not allowed to express itself, the half-timbered houses revealing a certain monotony and sameness because of the stricter architectural conventions and lost a great deal of charm thereby.

Until the twelfth century wood entered but little into the structure of houses in either France or England, stone being the chief material, but in that century France led the way to charming houses of wood, or part wood, and with the increasing prosperity of the middle class, wood houses became frequent. Wood was found to be much cheaper and houses of it were more quickly constructed. Merchants built house and shop in one, according to the needs of their business, and the size of their families. These old builders evidently took great pride in what they built for they put much thought and money into their homes. They loved to ornament their homes with carvings. Filled with the desire to establish a manor house, as it were, a place to be passed on from generation to generation, a mark of their family prosperity, and a home that descendants might be proud of, they spared no pains and expense. So one finds coats of arms, insignia and mottoes, and so on, relative to the standing and the religion of the owner, carved on the door, in the walls, at the gates, and over the fireplaces.

French Shop and Home Houses

To enter and examine one of these ancient wood houses of France is an educational experience, the workmanship is so fine. One is impressed by the great hand-hewn beams. In Switzerland one also finds hand-hewn beams piled one upon the other, crossed and fitted into each other at the angles. In this form of blockhan, or log house, all have support equally, so no picturesque bracing was needed. This "stacking-up" system is perhaps the oldest method of building, but the old Swiss chalets were isolated, not elbow to elbow as the French town houses were, and were far from art movements, so that they also lack the marked individuality of the French shop-and-home houses. The Swiss, in those old days, built with fir mainly, but throughout Normandy oak was the favored wood, and the old oak structures have withstood centuries, and are still sturdy and full of beauty.

Some Fine Gothic Carvings

In old French half-timbered houses the timber served in turn as braces or support or building courses, and the spaces left were "plugged" or filled in with plaster or brick. The plaster played no part at all as support, being used merely to fill the skeleton of timber. Timber, as builders know, keeps better when exposed to the open air than when coated over with plaster. The plaster, preventing the action of air, keeps the wood damp, which induces decay. This old *pau de bois* system of exposed timbers accounts for the long life of these old buildings of France. Some of them, between three and four hundred years old, are still in excellent condition, and would last as precious mementoes for several more centuries to come if as well cared for as they are today, or if some devastating war does not raze them, as was the case of some of the wonderful old half-timbered houses that stood in the path of the late war.

A few architectural critics venture to declare that, though fanciful and full of a certain charm of their own, these old French houses are lacking in breadth of treatment, that their surface ornamentation was but a mood of fashion, and represented no genuine phase of architecture. "To cut up surfaces," these critics say, "into compartments of many pilasters and entablatures is a commonplace and unprofitable motive."

But happily all critics are not of one mind, and some acknowledge that the charm and the individuality of these same cut-up surfaces are sufficient to give them a place in art, and one is apt to agree with the latter in looking over these photographs of the old houses, so full of a fine beauty and unique versatility of construction, that many of them could well be copied today and cause something of a sensation by their charm.

The photographs show houses from various parts of France, although most of them are from Normandy, where the idea of the half-timbered house had its birth. In some of them the parallel beams extend from one story to another. Some are in the form of diagonal laths, others are like a huge lattice, and still others show an independent mixture of any and every form that entered into the mind of the imaginative builder of those old days. Occasionally huge corner timbers are beautifully carved. There is one at Rennes with pillars carved after the fashion of those in old Continental cathedrals. Quite in keeping with the Gothic pillars are the carvings over the windows, at each side and beneath the overhang of the second story. The timber construction being less erratic than in some of the other old French houses, it is therefore quite in keeping with the style of the Gothic carvings.

At Alencon there is another beautiful old carved house, elaborately half-timbered. It has a high single gable and very symmetrical timbering. It is a genuine work of art, as one can see who notes even in a photograph the beautiful finish of the entrance and balcony doors and the fine placing and form of the windows. The loving care for detail of the old builders is plainly in evidence in each detail of this house. It is more beautiful today then when it was built long ago.

At Fongeres there is a fascinating old wood and plaster house, one of the store-and-home kind, and as it is rich in carving and much intricate work, we can easily imagine that its builder was rich. It has a charming roof and gables and must have been considered a sort of skyscraper of those early times, as it towers six stories tall. The builder certainly had ideas, for in his wonderful old home we find a series of shallow bay windows and a round turret effect on the corner jutting over the pavement. There is exquisite carving on the pillars and the finials and every carving so distinctly different in design revealing again the versatility of the mind that conceived the house. He certainly loved ornament for it touched everything, even the corners and supports of the roof receiving the minutest attention.

Those Quaint Houses at Horfleur

At Horfleur there is a whole street of quaint half-timbered houses, a very ancient business block that evidently was built by people of medium means, as there is no carving or elaboration, but a serviceable sort of art. These old houses had shops below and homes above. One of the houses shows genuine novelty in its gable-like outline of the timbers on the façade, with fascinating rounded-top windows tucked in between the bracing timbers just below the eaves.

(To be concluded

Success is the enemy. It is the only enemy that can overcome men who are invincible to failure. Men who cannot be beaten, though they fail a score of times, men who cannot be discouraged by an army of difficulties, sometimes go tumbling down as a result of a little success. More men are failures on account of success, than on account of failure. A man wants recognition and reward; we say these are natural desires, and so they are. But when a man gains recognition, the temptation is very great to stop and enjoy the recognition. And when he gains reward the temptation is to think that he has "arrived." Make your program so hard and so long that the people who praise you will always seem to you to be talking about something very trivial in comparison with what you are really trying to do.

Debt That America Acknowledges

Responsibility of Being Led

By MARGARET ROBINSON

THE LIBRARY JUN 2 19 UNIVERSITY

BRIEFLY TOLD

A Chinese who has not paid his debt on New Year's Day must go about all day with a lighted lantern until he has done so. For him the new year has not dawned—it is still midnight of the old year.

So great is the increase in tragedies due to the Jewish money-lenders of England that the matter has come before Parliament. Lord Darling, the famous jurist, proposed that the law should compel disclosure of "the real name" of the money-lender. "You might think from their names that the ancestors of these money-lenders took part in the Battle of Hastings, whereas the only military operation in which they had assisted was the passage of the Red Sea."

Apollo butterflies haunt the passes of Tibet up to a height of 17,000 feet where the wind sweeps furiously across the range.

Sales of Christmas seals for tuberculosis eradication last year exceeded $4,500,000.

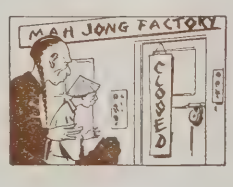
A man-and-bull team hitched to a two-wheeled vehicle, pulling a load of wood, coal, or other material, is a common sight in Japan.

Rabbits and snakes, acting as native hosts, have been found to be largely responsible for the spread of the chigre.

The shortest light waves known to man are the Gauma rays of radium.

A wilt-resisting flax which liberates an enzyme to attack the outrages of the fungus is saving the flax industry of the Northwest.

The world used approximately 200,000,000 pounds more wool in 1924 than it produced.



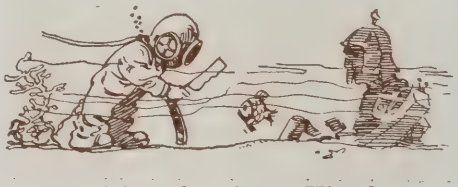
The cross-word puzzle craze has driven into bankruptcy the Fung Chow Company, Incorporated, formerly one of the largest domestic manufacturers of Mah Jong sets.

Madame Tussaud's Waxworks, London, of great fame and antiquity, was destroyed by fire with a total loss of priceless relics.

By charting the tremors resulting from an explosion of 182 tons of dynamite near Pasadena, California, it is now thought that the source of future earth tremors may be detected.

Though numerous livestock fatalities, due to potato poisoning, have been reported, human loss of life from this cause is very rare, two members of a Vandalia, Illinois, family having recently died, however, from eating green potatoes.

What an African diver thought was the ghost of an ancient warrier off the coast of Tunis, is believed to be the bronze prow figure of a galley containing treasure, sunk presumably some 2,000 years ago.



A rich ruler from Himalayan India, after being fêted and shown all the glories of England, was asked what most impressed him. "The green grass," he said.

John Todd, dangerous structure surveyor of London, the man who served notice of the condition of St. Paul's Cathedral, has resigned on account of criticism.

Cracks, along which 20-foot displacements occurred at the time of the San Francisco earthquake, could be traced for 190 miles.

More than 4,000 eggs, of varying degrees of freshness, were hurled in a University of Wisconsin student war, recently indulged in by the lawyers and engineers.

Bentonite, used as a base in the preparation of face creams and occurring in Western United States and over the prairie provinces of Canada, has the curious property of swelling from five to thirteen times the dry bulk with the addition of water.

In South Africa, where locust plagues are common, they have found that the arsenically killed insects can still be safely fed to horses and cattle.

The General Steam Navigation Company claims to be the oldest seagoing steamship company in existence, having started in 1824 with two steam packets, establishing a service on the Thames between London, Margate, and Ransgate.

The use of various waters in the prevention and cure of disease is one of the oldest therapeutic measures known to medical science.

London traffic constables now wear white rubber sleeves as far as their elbows to make their signals more easily seen.

The doctor's oath has an ancient origin, possible allusion to it occurring as early as 400 B. C., with certain reference occurring in the reign of Claudius.

Seaweed grown on limbs of trees set up in the bottom of shallow pools of water form an appreciable amount of foodstuff for the Chinese.

Two new genera of earthworms recently discovered in India strengthens the evidence of a faunistic relationship between India and East Africa.

The standard of value in China is the Mexican dollar.

Chello berries and living pigs are still offered by natives of Hawaii as a sacrifice to appease the wrath of Madame Pele, the goddess of the volcano.

Builders of the Pyramids ate onions, garlic, and lentils only.

No comprehensive census has ever been taken in China.

An instrument perfected for the long-range spotting of icebergs is so sensitive that the heat from the funnels of an approaching vessel will affect it at a distance of six miles.

There is no part of the world in which it does not some time rain.

Due to the white ant pest, all railroad ties, telegraph poles, and bridges of Rhodesia must be of iron.

About 2,000,000 miles of cloth is bleached annually in Great Britain.

This Issue

Mr. Ford's Page reverts to the matter of efficiency. This time it discusses the subject in relation to the Shop, and the things that come out of Shops. (p. 11)

It may seem strange that this country is not already credited with a music of its own. But it is still in the transition stage. Charles Wakefield Cadman tells us, however, that it is slowly and surely developing a national music that is neither "classical" nor jazz. (p. 2)

Margaret C. Robinson delivers an inspiring message to organized women on "The Responsibility of Being Led." Club women as a rule do not give sufficient thought as to who are their leaders or whether these leaders are leading them in the right direction. (p. 3)

Perhaps there is no subject more worthy of attention at the present day than that of home-building. America leads the world in the variety and beauty of its homes. It is interesting to hear what an architect and home-designer has to say about the ideal dwelling. (p. 5)

Soldiers are not always fighting these days, for which the world has cause to be thankful. Nevertheless, in times of peace their activities are manifold. It is a popular illusion that in peace time the "doughboy" has little to do besides drawing his rations and swaggering in his fine uniform. (p. 6)

The Israelites were "God's Chosen People." Where are they today? An influential world organization claims that they are to be found in the Anglo-Saxon-Celtic races now scattered over the British Empire and the American Republic. (p. 12)

A delightful nature study is to be found in Robert Sparks Walker's "Record of a May Day." Here there is communion with wild things. It is the psychology of the open spaces. (p. 14)

"Can you think on your feet?" asks Thomas L. Masson. He has heard a great number of our public speakers, and he gives us piquant pen portraits of their peculiarities. (p. 16)

There is a debt to France which America acknowledges, but has not yet fully paid. It is one of the most extraordinary war debts with which a nation was ever saddled. The circumstances attending the imposition of this obligation are clearly given. (p. 22)

Where is the Land of Enchantment? Where are those scenes that exercise a peculiar fascination over men of all races and creeds? (p. 24)

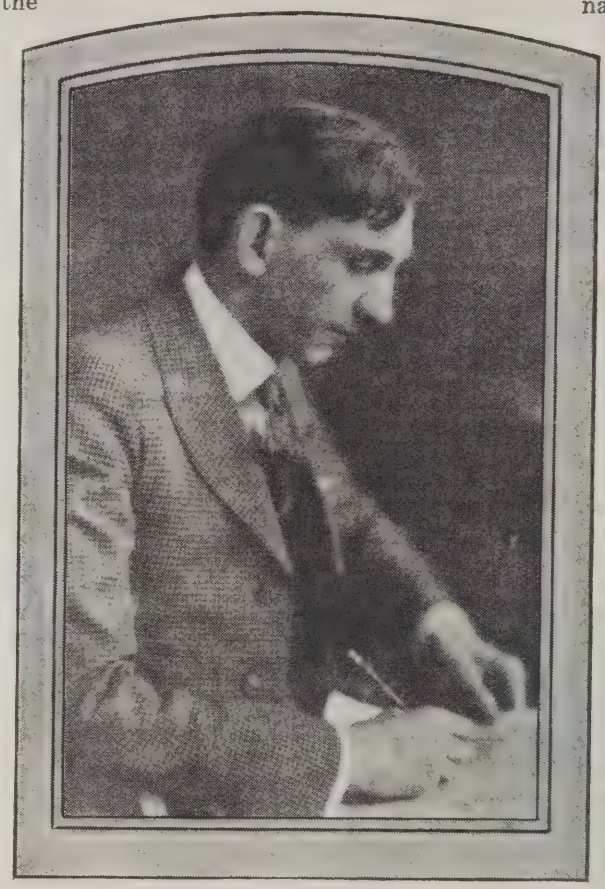
Uncle Sam Moves to His Own Music

America Forcing Its Way Through "the Muck of Jazz" to National Compositions

By HARRY H. DUNN

AMERICAN music, born around Indian camp fires, in the covered wagons of the pioneers, and in the homes and churches of real Americans, is in the transitional stage, but, in spite of the curb put upon it by foreigners, by alien impresarios and directors, the United States is slowly but surely developing a national music, a music which is neither "classical" nor jazz, a music which voices the ideas and ideals, the spirit and the spirituality of the best there is in America.

This is the message of the New World's foremost living composer, Charles Wakefield Cadman, who has lived to see two of his own American operas win success against the flood of alien-born music, and who is now at work on a third similar opera, which seems likely to be as successful as the other two. Hundreds of thousands of copies of his truly American songs are being sung throughout this country today, and he, more than any other composer and director—for he is both—stands at the head of the new American school of music.



CHARLES WAKEFIELD CADMAN

"We Americans—and by that I mean those of us who live in the United States—are beginning to develop a national music, just as years ago, Germany, France, Italy, and other Continental countries developed an individual music, each of its own kind," said Mr. Cadman. Working on the music of his third and latest American opera, "The Witch of Salem," he laid down his pencil and leaned back from the piano long enough to tell me just how a music of and from America is starting to force its way through the muck of jazz and the shell of outlander control which foreign hands have forced upon us.

"American music, which had its birth in the traditional and religious songs of the Indians, and which has accumulated much from the pioneers, the trail-blazers, the home-builders and the home-makers of this country, is now in the greatest stage of transition—the blossoming out into a national school of music which is of international importance. Understand me, I am not referring to patriotic music, to national airs, anthems, or other expressions of love of country; I mean that the people of the United States are developing operatic music, song music, dance music, all of its own kind, expressive of the history, the achievements, the developments, the real life, even the industrial advancement of this nation. This music always has existed; it sings from the pines of New England; it resounds in the storms on the Great Lakes; it whispers over the prairies as an echo of the red man's tribal lays and the thunder of the buffalo herds, and it roars from the sky-pointing redwoods of California. It always has been here, but never before have the musicians, the composers, the directors of America been able to express it.

"And it is going the right way, this music, traveling toward a goal of equality with, and probably superiority to, the greater part of the alien music with which we have been fed so long. The work of the American composer today is largely one of experimentation in rhythms and forms. The idea of indigenous musical themes, once held by many Americans, has been abandoned. Do not misunderstand from this statement that the whole background of the United States and its history does not furnish as inspired and as inspiring themes as the history of Europe has furnished for the older operas. But no school of music is being built, or can be built, solely on Indian themes. They are merely ingredients in the musical development American composers and musicians are preparing.

"Operas can be written around the native American themes, just as Puccini did for Japan in 'Madame Butterfly.' The musical world waits for an opera based on the Spanish Conquest of America; the revolutionary period in Mexico furnishes another desirable subject; the 'cachet girls' in Louisiana, a third; the discovery of gold in California still another, and so on for a list of at least a dozen matters of American history. There is today a greater interest in American operas than ever before. The American people are turning to American music to a degree they have not shown since the Civil War. An American composer today is assured not only of a hearing, but of the utmost consideration in the production of his musical work. Companies are being formed to take American operas on the road, and the response to such of these companies as have gone out has been great, a sure indication that the people want and will respond to productions written around American themes. My own American opera, 'Shanewis,' the story of a modern Indian girl in which the leading rôle was sung by Tsianina, herself a modern Indian girl, was presented at the Metropolitan Opera House in 1920-21, and given the best possible production.

"Where, heretofore, the American composer and librettist have been unable to get hearings, their works are now in demand. The reason for this is that the United States is rapidly becoming re-Americanized. Foreigners will not remain in control of our musical life, and, furthermore, will not remain in control of operatic productions in this country except possibly in New York. These foreigners in the past have graciously 'allowed' American operas to be produced, but have not permitted them to live, because they knew what we Americans have just discovered, that, once given the opportunity, American music lovers would prefer American productions to those of foreign composers and librettists. Take, for example, 'The Sunset Trail,' a tale of Indian life and pioneer days, the libretto for which was written by Gilbert Moyle, and the music by myself. This opera was given its world *premiere*, not in New York, but in Denver, in the middle of the continent, last December, and attracted an audience of more than 20,000 persons. Written, composed, acted, sung, di-

The Responsibility of Being Led

A Friendly Message to Organized Women, by One of Them

By MARGARET C. ROBINSON

ALL thinking people realize that the responsibilities of leadership are great. Most of us, however, are not born to be leaders, and such responsibilities do not fall in large measure upon the average woman. But equally great with leadership is the responsibility of being led. This is not so generally recognized, but it is a responsibility that rests upon everyone who follows the leadership of others, as we all do to a greater or lesser extent. It is *our* duty to make sure that those who aspire to lead us are worthy to be followed, and that they are leading us in the right direction.

Organizations of every kind urge their leadership upon us. Never in the world's history has propaganda of all kinds been so rife. Every shade of opinion and every school of thought is organized and asks our support. The American woman is a marvel to women of other lands in her capacity for and enjoyment of organized activities. One result of this situation is that it is comparatively easy for a few ambitious women, eager to push some political measure in which they are interested, to reach with their propaganda hundreds of thousands of other women quickly and with little expense, through the organizations which they control.

A Powerful Lobby Within a Lobbying City

There is at Washington an organization known as the Women's Joint Congressional Committee which has one of the most powerful lobbies in that lobby-infested city. It claims to represent 12,000,000 American women, and, with this claim, undertakes to bring enormous pressure on Congress. The organizations which this committee is said to represent are the American Association of University Women; American Federation of Teachers; American Home Economics Association; General Federation of Women's Clubs; Girls' Friendly Society of America; National Congress of Mothers and Parent-Teacher Association; National Consumers' League; National Council of Jewish Women; National Council of Women; National Educational Association; National Federation of Business and Professional Women's Clubs; National League of Women Voters; National Women's Christian Temperance Union; National Board of Young Women's Christian Associations; Service Star Legion.

Many of these groups have interlocking directorates, and a number of them interlock with some of the most radical and subversive organizations in the country. Florence Kelley, said to be the most influential woman in this combine, stated at a hearing in Washington: "We are now organized with a thousand ramifications. We have more interlocking directorates than business has." (Meatpacker hearing, May, 1921, p. 58.) Mrs. Kelley is a Socialist, ex-president of the Intercollegiate Socialist League, a former lecturer at the Rand School of Socialism, secretary of the National Consumers' League, is a prominent member of that very radical organization, the Women's International League for Peace and Freedom, and belongs to several other of the associations mentioned above.

State Measures Favored by Communists

The three most important measures which this Joint Congressional Committee has backed are the Maternity Bill, the Education Bill, and the so-called "Child Labor Amendment." All three are measures for which a sentimental appeal can easily be made, of a kind warranted to have great effect. *All three are measures which have the enthusiastic support of practically all Socialists and Communists in the country.*

The reply is made to this charge that the fact that Socialists and Communists favor a measure does not discredit it, and that they are praiseworthy for supporting such legislation. This view is held by those who do not know that one of the strictest tenets of Socialists and Communists is that they shall strongly and consistently oppose what they consider "reform" measures. What they demand is the *destruction*, not the *improvement* of our present system. To improve the present system is to preserve it—therefore they oppose improvement. They have a term of contempt for those who desire to improve existing conditions—they call them "meliorists."

The official booklet, "Programs of the Young Communist International," issued by the executive committee of the Young Communist International, February 20, 1923, affirms:

"The militant program of the Young Communist International, however, cannot respect the exigencies of the capitalist economic system, nor be merely a means to eliminate the worst instances of the exploitation of the working-class youth. It must proclaim . . . the complete transformation of the conditions of juvenile labor, and its socialistic reorganization."

One Should Ask the Reason Why

When, therefore, we find the Communists supporting a given measure, we have a right to ask whether they are doing so *because it fits definitely into their own program.* For instance, when we learn from the *Daily Worker* (Communist) of March 11, 1925, that the executive committee of the Workers' party (Communist) has sent out instructions to "all the party's district organizers, foreign-language federation secretaries and the Communist and labor press to begin immediately intensive action to save the amendment" we can be certain that their primary object is not to "ameliorate" the evils of Child Labor but to work toward government control of the *labor, education, and maintenance of youth, which is a vital part of the Communist program.*

Communists confidently count on the support of women's organizations. On December 5, 1924, the *Daily Worker* (Communist) stated its "program" as follows:

"State legislatures must be compelled to ratify immediately the Child Labor Amendment to the Constitution; Capitalism's Congress and State legislatures must be compelled to pass laws providing full government maintenance of all school children of workers and poor farmers, without which, the Workers' party declares, a child labor law is useless."

Giving a Bill a Good Name

On the same page it stated its "policy," which includes "intensive agitation in women's organizations."

There is an old adage "Give a dog a bad name, and hang him." There should be a modern version, "Give a bill a good name and thousands will indorse it without investigation." The Maternity Bill is a case in point. This bill received the indorsement of the Executive Board of the General Federation of Women's Clubs. The first year it came before the Women's Clubs of Massachusetts, the sentiment in its favor seemed practically unanimous. It did not go through that year, so the next season it came before them again.

A popular club woman, ex-president of a large club, one of the women who does not choose to be led unless she knows where she is going, had taken the trouble to study this bill, and found much in it to disapprove. She therefore took every opportunity which offered to go before women's clubs to oppose it. As a rule her procedure was *merely to read the bill to her audiences.*

She said the faces of many of the women were a study. They would come to her afterward and say, "But surely *that* wasn't the Maternity Bill which you read to us; *why, it didn't even mention mothers and babies!*"

"Oh, no," she answered, "*it doesn't mention mothers and babies;* it just tells how much of our tax money shall be taken from the Treasury, and how many political jobs shall be created at Washington—*but that is the Maternity Bill.*"

This experience was very salutary, and so many women, after informing themselves of the real nature of the bill, opposed it, that it was defeated in Massachusetts. *These women had been accepting leadership without investigation,* and without realizing their own responsibility in the matter.

During the summer of 1924, a woman greatly interested in good government spoke in a country church in New England on "Practical Patriotism." In the course of her talk she stated her conviction that the so-called Child Labor Amendment was fraught with danger to childhood and to our country. Several members of the local Women's Club were so amazed to hear her oppose this amendment that they invited her to speak to their club and explain her opposition more fully. In opening her talk at the club she said: "I understand that those of you who heard me speak at the church were very much surprised that I should oppose the Child Labor Amendment. I am going to ask all of you who have read this amendment to raise your hands."

Not a hand was raised! These good, conscientious women, supposing that *of course* a measure called "The Child Labor Amendment" must be a good thing, especially as it was indorsed by organizations to which they look for leadership, had not taken the trouble to read it!

So canny are clever propagandists in giving appealing names to their socialistic, bureaucratic measures, that it is a tolerably safe rule *to beware of a bill or an amendment with a sentimental name.* A good bill doesn't need a pretty name —it can stand on its own merits; a bad bill does need a good name, to impose upon the public —and it frequently gets it!

The Trouble of Being Ignorant

Women in general have shown themselves very easily influenced to support Federal bureaucratic measures if the appeal comes to them in a humanitarian guise. This fact gives special point to the remark of a noted Englishman who was asked to address a convention of a women's political organization in Washington soon after the passage of the Nineteenth Amendment. So little accustomed are American women to plain speaking by the opposite sex, that his audience was astounded when he said to them: "The trouble with you is that you are so ignorant. Unless you inform yourselves, you will be a menace to your country."

It is, I am convinced, because women have *not* informed themselves on vital questions of government but have followed blindly the path their radical leaders have chosen, that we see them today, as a well-known club woman has expressed it, "busily and gaily doing what they can to destroy their own and their fellow citizens' constitutional freedom, doing all that they can, through the multiplying of bureaus and the strengthening of bureaucracy, to change our government into a democratic autocracy, to impose its will upon the states and the people." In so doing, they are working to transform themselves and the rest of us from *citizens* into *subjects.*

How shall we define bureaucracy? It is the substitution of government by political appointees for government by elected representatives. It is, therefore, the enemy of self-government, which is the cornerstone of our Republic. George Washington warned his countrymen that it is "the ordinary weapon by which free governments are destroyed."

The Menace of the Communist

A very serious reason why every patriotic person, man or woman, should combat the trend toward bureaucracy and paternalism is that the resulting interference in the personal affairs of the people tends to encourage hatred of our government. This is a curse from which our country has happily been free, because until recently our government at Washington has interfered very little with the right of the people to govern themselves. The enemies of our country who desire to see our government overthrown encourage every tendency toward centralization, *because* it will arouse the antagonism of the people. The Communist party of America, which is the open enemy of our government, is on record as saying: "The American Government . . . has grown into a mammoth monster of centralization, similar to that of the old European governments . . . A centralized government which interferes in the daily affairs of the working class, is the basic condition . . . the fundamental condition for the formation of a nation-wide political mass party—the birth of a (Communist) Labor party."

How can any true American contemplate without dismay the substitution of a Socialist bureaucracy in place of our great Republic? The change is, however, taking place before our eyes, and nothing can stop it but an awakening of the people to its dangers.

A great modern statesman says of this destruction of self-government in the United States: "The most distressing thing about it is that no one seems to care." To me, the most distressing thing about it is the part women's organizations are playing in hastening the destruction.

A distinguished author who is also a prominent club woman, Mrs. George Madden Martin of Louisville, Kentucky, is so alive to the dangers of women's unthinking acceptance of the leadership which is working to replace self-government with bureaucracy that she has written an open letter to her State Federation in which she says: "We organized club women, with our eyes centered through the eyes of our national leaders upon Washington and functioning through this highly efficient lobby which we are helping to maintain, have, in less than four years, gotten behind twelve measures . . . all twelve asking for Federal control as opposed to State control; all twelve straight measures of centralization of power; and all out-and-out pleas for paternalism."

In an illuminating article on "American Woman and Representative Government" in the *Atlantic Monthly* for March, 1925, Mrs. Martin says:

"Now it may be that the majority of us women here in the United States are really convinced that our political institutions as now existing are unfitted longer to carry on government as desired by the people. It may be that the majority of us women are ready to abandon that 'dispensation of individual liberty which the Constitution of the United States offers them,' though myself I do not believe it.

"What we women cannot do, however, is make the Constitution a working agent of another, even if a desired system. To have the one, we must first abandon or destroy the other. . . .

"Let us women be as frank here as we are about our lobbying and our group coercion. If the majority of us are agreed against our present system in government, let us say so and get about the next step, which is to declare as frankly what we do want. But at once to ratify a system through a voluntary acceptance of citizenship under the system, and the while be boring from within to destroy what we are ratifying —this would seem to be the part of the witless, the tool, or the enemy."

Reason Why Some Units Unite

A distinguished historian, Professor Wilbur C. Abbott, of Harvard University, in his remarkable book, "The New Barbarians," says:

"Apropos of the entrance of women into political life, it has been urged that one reason for the demand for creation of so many new bureaus is that the leaders of this latest addition to our electorate, finding it impossible to secure as many positions as they require from the present holders of office, seek to create new ones which they may enjoy. This, if it is true, explains many things in our present situation." It does, indeed—it explains, for instance, why the bureaus which they plan and work for are such as women obviously seem fitted to manage—the Women's Bureau, the Children's Bureau, an Education Bureau, et cetera.

The radicals—the out-and-out proletarians—want bureaucracy because it tends to destroy our form of government. Political women want it because it offers jobs for women in politics. The two forces are not yet openly allied, but, as Professor Abbott points out, their combination is inevitable and is rapidly approaching. The Socialists, Communists, and the Women's Joint Congressional Committee were a unit in working for the Twentieth Amendment. They were a unit in working for the Maternity Bill. They were a unit in working for the Education Bill. When the schools of our country, the

(Continued on page 19)

Home, Sweet Home

By ALBERT WOOD, A. I. A.

A modern shingle-sided home designed with spirit and inspiration.

A modern "Colonial" house—built of wood, with wide cypress siding; should stand two hundred years.

"Home, Sweet Home," East Hampton, Long Island, New York.

NO NATION in the world's history has ever been engaged in such a tremendous home building program as we are at the present time. Assets of building and loan associations have increased from $1,100,000,000 in 1912, to nearly $4,000,000,000 in 1924. Out of 116,000 permits issued in sixty-eight cities of more than 100,000 population, during the first half of 1924, more than 84,000 were for one-family buildings, and more than 23,000 were for two-family buildings, and, according to Department of Labor reports, the one and two family houses represented more than 51 per cent of new construction. We find the city of Oakland, California, building, during 1924, on an average of 600 homes a month, and the building of individual homes, particularly in the newer parts of the country, has been breaking all records.

There are a number of reasons for this rush toward home ownership. We are catching up with the normal demands which, during the period of the World War, we were unable to meet. Through the propaganda of the "Better Homes in America" movement, people are learning a great deal about the advantages of home ownership. The many ingenious devices for making housework agreeable and easy, as well as the development of the radio and the other types of entertainment which may be best enjoyed at home, make "Home, Sweet Home" appeal to a greater degree than ever before to every member of the family.

The automobile is playing a big part in developing a desire to enjoy the freedom and comforts of home life, and, by providing individual means of transportation, is opening up large areas that were previously inaccessible. The modern city may be compared to a wheel, the hub containing the huge buildings with all of the facilities for shopping, theatergoing, and the intensive business activities of our modern life, and connected by avenues or spokes to a vast residential area around the rim, which is the borderland between the city and the country.

More than thirteen hundred communities are organizing campaigns to give further impetus to the Home Building movement. As Herbert Hoover, president of this movement, says, "We want the economic and above all the spiritual values of owned homes." The national headquarters of "Better Homes in America," located in Washington, works to coördinate the activities of national, state, and local organizations, which deal with any phase of home life.

Every household magazine of today carries articles on almost every feature of home building, from the illustrations of model plans to articles on every detail of furniture, decorations, and equipment. We find the furniture manufacturers making splendid copies of period furniture, as well as fine examples of modern designs, at prices which make them available to almost everyone. The manufacturers of wall paper, fabrics, and special finishes for walls, offer an infinite variety of very fine things.

The electrical appliances that lighten the housework are almost without number—automatic electric stoves, electrical cooking devices of all kinds, vacuum cleaners, washing machines for both clothes and dishes, being the best known and most commonly used.

The modern living room, which has taken the place of the old-fashioned parlor, becomes the ideal place for the installation of the radio, phonograph or other instruments that supply entertainment and amusement far beyond anything that could have been imagined by our forefathers.

This great interest in everything pertaining to the home is developing, or rather recreating, a type of architecture distinctly American, and our illustrations show some of the most modern homes compared with the home of the Colonial days of more than a hundred and fifty years ago. Then the home was the center of the social life and interest and we always think of that great period as symbolizing all that is fine in home life. It appears that in this day we are rapidly moving toward a period that will even surpass those great Colonial days of the past.

With its cosmopolitan population, it is natural that America should show an internationalism in design unknown in other countries. The vast area of the United States, containing, as it does, all varieties of landscape, topography, and climate, and with an almost unlimited choice of building materials, encourages the development of every style of architecture and every combination of materials. It is perhaps for this reason that American domestic architecture of today leads the world.

The early colonists, bringing fine traditions, ideals, education, and a cultured consciousness to this virgin land, planted the seed that flowered into our most distinctive style of architecture—the Colonial. These early settlers worked with the inspiration that came with developing the first uncivilized country since Southern Italy was settled by the Dorians. How well these craftsmen and carpenter-architects builded is evidenced by the many fine examples still standing, which, although built almost entirely of wood, are even today in a wonderful state of preservation. The shingle-sided house, immortalized by John Howard Payne in his song, "Home, Sweet Home," and built in 1660, is still standing in Easthampton, Long Island, New York. The Mulford House, also built in 1660 at Easthampton, and similar in design and materials, remains today in an excellent state of preservation. There are many fine wooden homes still in existence, more than a hundred and fifty years old, whose details and construction have inspired our best architects and builders to a further development and adaptation of this heritage of architecture.

It is not surprising that with the great volume of building we are doing today, many perfectly atrocious designs appear. It is difficult (Concluded on page 51)

What Does Our Army Do When Not Fighting?

By THOMAS A. WADDEN

WHAT does our Army do during peace times? The average citizen has a fairly good knowledge of the war history of the Army, but he is quite ignorant of its activities in times of peace. For the year ending June 30, 1925, Congress voted the War Department an appropriation of $334,553,786.13. Of that amount, $256,515, 279.13 was appropriated for purely military and departmental activities. Can the War Department justify the expenditure of such a vast sum of money?

Properly to appreciate the present activities of the Army, let us briefly review only a few of its splendid achievements of a non-military character. The Army has been a powerful factor in the development of the nation. The necessary size, efficiency, and resource of its organization enabled it to accomplish many things which were too large, or the commercial value of which was too remote, for private enterprise.

The Army is virtually the pioneer of the pioneers. The Government made the Louisiana Purchase in 1802. All that was known of the territory acquired was that it was a land of rugged mountains, limitless plains, impenetrable forests, and rushing rivers; the home of hostile Indians. Captain Lewis and Lieutenant Clark, with four sergeants, twenty-three privates, and a number of Indian guides, set out in 1803 to explore this vast region and to learn something of its resources. Two years were spent in traversing this unknown land to the Pacific and back. They made surveys, hewed trails, and gained much information of great value to the early pioneers.

The Army conducted most of the preliminary explorations in the early history of our country. It blazed trails; and it alone was able to make surveys and maps which are so essential in the opening up of a new country. When the pioneers moved westward, it was over roads built by the Army, and protected by military posts. They settled on land which had been surveyed by the Army, and their title was valid only by virtue of those surveys. The Army surveyed and marked practically every boundary of the United States, and most of the state boundaries. The Army surveyed the Great Lakes; it built lighthouses to make navigation more safe, and it has spent millions of dollars to increase the depth and width of the channels in the important harbors in this country.

The achievements of the Army are a bright page in the history of early transportation of this country. Up to 1855, there was scarcely a railroad that was not planned, built, and operated largely by Army engineers. They projected, built, and operated for a time such well-known roads as the Baltimore and Ohio; the Erie; the Boston and Providence; the New York, New Haven and Hartford; and the Boston and Albany. Later on, they helped build some of the transcontinental lines. The Army helped dig the Chesapeake and Ohio Canal, and the Erie Canal. The old Cumberland Pike, extending from Cumberland, Maryland, to St. Louis, traversed by many a pioneer on his westward journey, was built by the Army.

To the Army must go much credit for the early development of our steel industry. The Army furnished the original market for steel products and led the entire industry in specifications for design. In 1880, the requirements for high carbon steel in making guns was 50 per cent more severe than were the general industrial specifications. Army ordnance officers introduced alloy steels in the manufacture of army materials and prescribed the use of nickel steel before it had been used for industrial purposes.

Military experimentation in the design of tanks and artillery tractors has greatly accelerated the development of the tractor industry. The tractor has proved a boon to agriculture, because for certain classes of work it is more efficient and more economical than the horse.

Aircraft is now acknowledged as one of the most important instruments in aggressive and defensive warfare. The technique of this industry has shown great advancement during the last few years, due primarily to improvements made by the Army and Navy in competition with other nations. The Army is vitally interested in the development of commercial aircraft not only because of the improvements in design and construction which might result, but also because in time of war it would have immediately available experienced aviators.

The Army was an important factor in improving methods of rapid communication. As late as 1877, it was operating 3,000 miles of telegraph lines in the South which provided the framework of the present systems in that region. The invention of an Army officer, revolutionary in character, permits the transmitting, simultaneously over the same line, of a number of telegraphic messages and at the same time to carry on several telephone conversations. The Signal Corps now operates about 400 telephone systems, half of which are owned by the Government.

The French were compelled to abandon the construction of the Panama Canal because of the terrific loss of

Medical bacteriological laboratory.

life among their laborers as a result of yellow fever. In 1901, medical officers, under the leadership of Major Walter Reed, definitely established the fact that yellow fever germs are transmitted by mosquitoes. Within a few months from the time of the discovery, this pestiferous district was converted into a healthful region. Through the efforts of medical officers, tropical anemia, or hookworm disease, has been practically eliminated. This discovery has reduced the death rate in Porto Rico by a number exceeding the total number of men killed during the Spanish-American War, and the efficiency of the natives has been increased 60 per cent. The sanitation methods adopted by the Army in the Philippines has eliminated beriberi, and malaria has been brought under control.

The progress made by our Army medical officers in their battle against disease is an eloquent tribute to their skill and eternal vigilance. While 7,000 soldiers died during the Civil War as a result of smallpox, and 258 in the Spanish-American War and Philippine Insurrection, only 14 of our soldiers were lost from this disease in the World War, although more than 4,000,000 men were in service. Malaria caused the death of 15,000 in the Civil War, and only 25 in the World War. Twenty thousand of our soldiers, or 12 per cent of the total, suffered from typhoid fever during the Spanish-American War. Vaccination was made compulsory in the Army in 1911, and as a result there were only 2,000 cases of typhoid during the World War, or one-twentieth of one per cent.

At the beginning of the World War, American relief for the stricken people of Europe was effected largely by personnel drawn from our Army. The American Expeditionary Forces provided convoys for American relief, furnished courier service, and helped distribute supplies. The Army preserved order and rendered effective aid during the San Francisco earthquake and fire, the Galveston disaster, and the Ohio and Mississippi floods in 1912.

Space will not permit a recital of all of the non-military achievements of the Army. Enough has been said to show that it played an important rôle in opening up vast regions to our early settlers, in the development of some of our essential industries, and in improving the health of this country, our dependencies, and, indeed, of the entire world. It should be borne in mind that while the Army has been carrying on its non-military activities, it has been called to active service more than 100 times. It is true that a great number of these engagements were only Indian uprisings, but they were of a sufficiently serious nature to call out the Army, and had the latter not dealt with them promptly and decisively they would have undoubtedly developed to alarming proportions.

Baking bread at an Army cooks' school.

What is the Army doing today? What has it done since the close of the World War?

The primary purpose of all the work of the War Department is to provide for national defense. All other activities are merely by-products of its primary purpose. What then is the Army doing in the way of national defense?

Prior to 1916, the War Department was without the legislative basis for a progressive military program for defense. Under the new defense act, it is charged with the responsibility of so organizing the Regular Army that it will serve as a nucleus for a great National Army for use in a time of emergency. Plans for the raising of a great army by the War Department contemplate the expansion of existing units rather than the creation of new ones. To meet adequately this responsibility, it must so organize the Regular Army—composed of 12,000 officers, and 125,000 enlisted men—that the national resources, both men and materials, may be used with the greatest speed, economy, and effectiveness. It must provide an adequate, efficient, and mobile force that is at all times ready and available for any emergency within this country or elsewhere. It must patrol 1,500 miles of Mexican border, and provide adequate defense for our oversea possessions. To protect the latter, we have garrisons stationed in Alaska, Hawaii, the Philippines, Panama, and Porto Rico.

The difficulty of maintaining the Army at a high state of efficiency is increased because of the changing personnel. Under the three-year term of enlistment now in vogue, an average of about 60,000 men leave the Army each year. The new recruits who take their places must be developed into efficient soldiers, and so assimilated into the Army that its efficiency is maintained at a high level. This requires an intensive training, both speedy and thorough. An effort is made to instill in each soldier a self-discipline and skill in the performance of those functions needed in the Army so that he will react speedily and effectively in time of stress or emergency.

Particular emphasis is given physical training by the Army. No soldier can effectively discharge his duties unless he is in first-class physical condition. The physical development of our youth will in itself justify our investment in national defense. Why do Americans need this physical and sanitary training? Records of the World War reveal that 50 per cent of the drafted men had physical defects, many of which would in time prove disabling, but most of which could be remedied with the proper physical training and instruction. The majority of our recruits were awkward, narrow-chested, underweight, and in a subnormal physical condition. With a few months of physical training, with regular hours, and plenty of wholesome food, they became broad-chested, square-shouldered specimens of American manhood. Sixty thousand men, in first-class physical condition as a result of three years' training in the Army, returning annually to private occupations, are a potent factor in the development of the social and industrial life of our nation.

Soldiers learning practical mechanics in an Army school.

Soldiers are instructed in such matters as drill regulations, signaling, marching, care of equipment, tent pitching, first aid, and the customs and

courtesies of the service. They are taught to do teamwork and must learn to think and act for themselves when separated from their commands. Modern warfare is fought not with brute strength, but with science. Nearly half the enlisted men require technical skill to perform their functions in the organization. To provide the necessary training, schools are maintained, presided over by a commandant, assisted by a staff of competent officers.

The following are some of the many types of skilled workers used in the Army: Tractor drivers, chauffeurs, auto mechanics, battery repairmen, tire repairers, ignition and carburetion experts, teamsters, wagon masters, shoemakers, saddlers, blacksmiths, horseshoers, highway and construction men, bridge builders, firemen, sheet metal workers, concrete workers, brickmakers, stonemasons, painters, carpenters, plumbers, welders, wiremen, radio, telephone, and telegraph electricians, linemen, switchboard operators, stenographers, bookkeepers, draftsmen, photographers, motion picture operators, printers, surveyors, pharmacists' assistants, bakers, cooks, tailors, and so on.

Soldier students at Army horseshoers' school.

Approximately 30,000 men annually returning to private life have received training in a trade which will permit them to earn a comfortable living. This function of the Army is not only a great benefit to the individual, but is an important contribution to the commercial and industrial life of the country.

The process of making a successful officer requires years of training. Some of the officers come up through the ranks of the Regular Army, some from the National Guard, some from the reserve officers who served in the late war, some from West Point, and others from the Citizens' Military Training Camps. The education of the young officer is continued at an army post or garrison by practical training and experience in the training of troops, and in other military duties; or he may be sent to one of the schools which specialize in the instruction in the special duties of a particular branch of the Army. Graduates of these special service schools, showing particular aptitude, are sent to the Command and General Staff School at Fort Leavenworth. Upon completion of their course there, if they show proper fitness, they may be placed on the eligible list for general staff duty. The Army War College at Washington completes the course of instructions for officers, and those who show unusual ability may be selected for duty in the War Department General Staff.

Reserve Officers' Training Corps are maintained at more than 200 civilian colleges, and some 600 Regular Army officers are detailed annually to conduct this training. In any of these colleges, a student may secure a commission while pursuing his studies. During the last year, 110,000 students were enlisted in the R. O. T. C. In addition, the War Department conducts the Citizen's Training Camps, with an enrollment of 34,000 in 1924, which afford opportunities for able-bodied young men to obtain a commission by taking the necessary training and proving themselves worthy of the honor.

The War Department exercises certain supervisory power over the National Guard in time of peace. In the event of a national emergency, the National Guard becomes a part of our National Army. There are now approximately 10,000 officers and 150,000 enlisted men in the National Guard, and some $25,000,000 is annually spent by the War Department for its training, equipment, and summer camps.

The training of officers and enlisted men is only one function of the Army. They must be supplied with equipment, ammunition, arms, horse equipment, tools, machinery, food, clothing, hospital supplies, housing, and countless other things. As conditions change, many kinds of equipment become obsolete, thus making it necessary for army experts to be constantly at work studying, investigating, and experimenting that the Army may keep abreast of the advances made in the science and art of warfare.

In modern warfare, mobilization of industries is imperative. In the late war, the Army was unable to gather up quickly the great multitude of necessary war materials. Industrial plants were hastily converted into factories for war supplies, often at a loss to the owners; in other cases, people whose greed exceeded their patriotism made unconscionable profits at the expense of the Government. To eliminate as far as possible the confusion, loss of time and money in any future emergency, the present plans provide for a mobilization of our industries by a committee of experts, composed of civilians and Army officers. A comprehensive survey is being made as to the location and size of plants, the kinds of work they are best equipped to do, and the cost of their product.

Fortifications are necessary at strategic points to protect our naval stations, harbor facilities, and important cities from bombardment, and to provide safe anchorage for our fleets. To offset recent improvements in aircraft, and long-range guns, these forts must be continually improved, and their batteries modernized. There are 25 of these forts which protect such important harbors as New York, Boston, Philadelphia, and San Francisco.

One often hears criticisms of the "red tape" of the Army. These critics fail to take into consideration that in such a vast organization, open to criticism, as it is, by any citizen of this country, it must have certain recognized rules of procedure in performing its functions. To grasp the magnitude of the administrative details of the Army, consider that in the files of the Adjutant General's office alone there are records of 30,000,000 individuals, nearly 10,000,000 of which have had military service. In 1919, that one office received more than 80,000,000 pieces of mail.

In addition to all the functions incidental to the maintenance of the "War Machine," the War Department is charged by statute with the administration of the civil government of the island possessions of the United States. The Bureau of Insular Affairs handles all the business of the Philippines and of Porto Rico amounting to more than $78,000,000 annually. (Concluded on page 20)

EDITORIAL

MR. Dawes, the Vice-President, is making what he undoubtedly feels to be a popular campaign for the revision of Senate rules. If he were protesting against a condition which suppresses and tricks, he could probably raise, even in this off political year, some public interest. The public is always against the gag and the shrewd legal twist. But a set of rules which gives everyone free speech for as long as he likes spells freedom and frankness, and it will be rather difficult even for a Vice-President to present those qualities in an undesirable light.

Mr. Dawes Not Very Impressive

If Mr. Dawes replies that he does this to expedite legislation, the answer is that if Senatorial talk delays legislation, let us have more talk that we may have less legislation. We have too much legislation now that was born of too little threshing out of the subject. Let the mere orators be corrected by the fact-finders, and then let both wrestle together until it is too late to add to our mountain of laws.

Imagine that happy time when legislation shall be superseded by conversation. Then, it may be, we shall get somewhere.

RARELY does success greet the great church financial drives, the probable reasons being that they originate at the top and then try to force themselves down upon the people, and that they represent a method of procedure which the people have not learned to associate with religious projects. Most of the large denominations have the failure or wreckage of drives to deal with at present. A happy exception, however, is that of the Episcopal church in its effort to make reasonable and decent provision for its aged ministers. This drive, it is announced, actually exceeded the figure set. As it is not an effort at denominational aggrandizement but a human and Christian act in behalf of men whose good works are seldom even partially rewarded in this world, its success is pleasant to contemplate.

A Church Drive That Made Good

IT IS an old and honored maxim that advises us, "Play your part; make the best of your life among the circumstances in which your lot has been cast."

That is probably good advice. But it is honored too exclusively. Monopolies invariably lead to an abuse of power, and the swing allowed this maxim gives it something in the way of a monopoly.

Regarding the Reign of Circumstance

If it be true that all truths are of Dionysus or of Apollo, this is an Apollonian truth. What, then, is the Dionysian truth in this matter?

Merely this: that there is no such thing as a "lot," that in fact "circumstances" are a vulgar superstition—a miserable left-over from feudal days, when the serf was told his slavery should be kept unsullied by the desire for freedom; the desire for freedom being an insult to God, who had ordained that the serf should be a bondsman all his so-called life.

A survey of the universe, whether scientific or philosophic, finds no "lots" cast, and no "circumstances" possessing in actuality the stability allowed them in the word. There is one thing constant under the sky, and that is change. The circumstance that today presents an unyielding front, and with others forms a wall that forces one to shape one's course to conform with it, will tomorrow be qualified, transformed or undermined so that to circumvent it or trample it needs only wit and will. But *tomorrow*? A day is not always wanted. Even an instant may serve the turn!

IN one column of the papers we are told how the Japanese representatives at Geneva and the American representatives kidded themselves with liberal doses of this international friendship stuff. In another column we read how scores of swift Japanese power boats, "ostensibly out fishing," the responsible correspondent says, scurried through the length and breadth of the American fleet in naval practice at Hawaii, and how they visited the ammunition stores and the repair facilities. It is this discrepancy between what gentlemen say at banquet tables and what governments do as matters of daily routine, that adds to the skepticism of nations and leaves unchallenged the statement that between nations there never has been and cannot be such a relation as friendship. Even our own gentlemen, while expressing, as they say, the Americans' undying admiration for this nation or that, are holding out financial threats which are today the most formidable of armaments and offering to crack anybody's head who fails to meet certain demands.

Saying Is Not Always Doing

IF all the tales are true that come out of the dry navy, the United States is on the job and will act against the rum smugglers as against any other injurious invaders of this country. The almost intolerable fact is that the situation has been allowed to continue so long. There is probably an understanding with the Government of Great Britain as to this action of force against men who are for the most number British nationals. This supposition is grounded on the fact that genuine British sentiment is against the attempt to break a friendly nation's laws. The smugglers have been warned by sentiment in Britain and have defied it; they have been warned by sentiment in America, and have defied that; the next and logical resort is to force, and to force of such a character as leaves no doubt about it.

The Dry Navy May Shoot

WHEN George the Second was king, there was an old admiral named Vernon who wore a cloak of coarse green cloth called grogram. From this circumstance he was nicknamed "Old Grog" by the sailors of the fleet. "Old Grog" decided that the rum ration of the sailors would be improved by dilution, and the mixture was thenceforth known as "grog."

What Is Grog?

No doubt "Old Grog" was commended by the government for his economy, although he was reviled by the old salts. But they little thought that nearly two hundred years afterward some of the sailors would be willing to do without the rum ration in its entirety, for the few extra pence added to their pay.

During the World War, Winston Churchill encouraged the men of the navy to do without the rum ration, and gave them the option of receiving an equivalent in money. Many took advantage of this, and so much has the taste for liquor declined in the British Navy that the authorities are seriously discussing the total abolition of the grog allowance.

In these days of increased cost of living, the extra amount of cash which the sailors will receive in lieu money is a consideration.

But the British are only following the example of Josephus Daniels, who banned alcoholic berevages when he was Secretary of the Navy. But "Old Grog" started it.

"DEFLATION in over-optimism" is new, euphonious, and strictly accurate as applied to the present situation in the speculative markets, where confidence in unwarranted boasts of prosperity "just around the corner" led many to indulge in a gamble on the continued rise in quotations failed to get out before the market collapsed.

"Deflation in Over-Optimism"

"Deflation in over-optimism," as nearly as can be learned, is a phrase coined by William F. Knox president of the American Bankers Association, and he sprang it at their meeting at Atlanta in April.

The gist of the address by President Knox is that real business conditions were but slightly, if at all, affected by the fluctuations of the stock and grain markets. And he spoke truly—as far as he went.

Could the losses in market gambling be confined to those who prefer to win a dollar rather than earn it, the over-optimism and its deflation might be passed over as an amusing incident. There is a tragic sequel which brought loss to thousands of innocent investors who had no thought of gambling. During the presidential campaign they pointed to the improved business as based on a permanent demand, and predicted even greater prosperity if the President should be chosen to succeed himself, although they know, and Mr. Knox now admits, that speculative and business trading have no relationship. The election went as desired and an inflation of stock process began. The bankers knew there was every reason for conservatism, but were so busy sounding their hallelujah chorus of "four years more" they failed to note even the diminishing aggregate of deposits until those who relied on their predictions had lost their money.

Didn't you hear how agriculture had come back? And didn't you know better?

Government reports of visible supply, acreage condition, etc., were bullish from the time of marketing the 1924 crop. Spring wheat growers were led to excessive sowing by prediction of grain shortage. Basic conditions of business, while fair to good, did not warrant a boom, and the Federal Reserve stood back with hand ready to close the throttle of the power if expansion became too great.

All this was known to Mr. Knox and his associates, but not generally, and no warning was given of the coming storm, save by investment papers of the better class and a few publicists who write as they see and not as they are told.

Aside from this, legitimate trade has expanded in more orderly fashion, and the real boom is still up the street.

CONSIDERING their enterprise in other directions, it is rather strange that newspapers have not considered and adopted the idea of Exchange Reporterships. Maybe it is a new idea, and this may be its first mention to them; as to that we cannot say. But it is apparent from contact with newspapers that such a system would add greatly to the efficiency of the daily press.

Why Not Exchange Reporterships?

No city now is self-contained. We have motor centers and pickle centers and steel centers and textile centers and agricultural centers and financial centers and political centers and propaganda centers, knowledge of which outside them is dependent on what comes over the wire. Rumors that fly abroad and that arrive at newspaper offices by every kind of channel are impossible of judgment, there seldom being on the staff a man of first-hand knowledge of the probabilities. If newspapers in the pickle center could exchange, say, two of their best young men with newspapers in the motor centers, and permit them to undergo an intensive process of getting acquainted with industries and conditions away from home—acquainted, not as hurried travelers looking for a story, but as guest reporters working along the regular lines—it would make for a broadening view of our country as a whole. As it is, newspapermen get a semblance of this by becoming something very like tramp reporters.

The Press of the country needs more of research and less of reporting just now. Very much of what it reports is not true, but it does not know that. It knows that it gives a true report of what it receives, but it has no standard by which to judge the truth or completeness of what it receives. There are industrial organizations in this country that no longer rely on the press, because the press will no longer dig to the basic strata of the facts with which it deals. The newspaper is so vital to the country, and instant confidence in it may become so necessary in a moment of emergency, that no means should be spared to bring it to a higher degree of service and reliability than it has ever attained.

Mr. Ford's Page

IT may be one reason for the antipathy of professional reformers against the method called Efficiency, that it came out of the Shop. The Shop is not the scholar's library, nor the literary forum, nor yet the porch of philosophy, but it has gained a larger place than these in the life of the people, and will be judged as sharing largely in the glory of humanity's rise. Only futile minds, tugging vainly against the onmarch of development, will indulge a feeling of superiority to the Shop.

From a Carpenter Shop came the sublimest teaching known to man. From a Cobbler's shop came the most successful scheme of world conquest. From a print shop came America's profoundest practical philosopher, "B. Franklin, Printer." From a potter's shop came the enameled ware that furnished our tables. From the poor shop of a lonely experimenter, down to his last desperate expedient, came the discovery of vulcanizing rubber, which allowed children and women to go safely through storm and cold, and led the way to the tire on which the whole world rides. The list is interminable. Take every article of use—no, limit the list; take every article that spells the difference in the waste of time and strength and life between the last generation and this, trace it to its source, and you find a Shop.

People who like a "nice" life, with utilities and conveniences and even luxuries of quality and taste, often profess to dislike the Shop because it seems to spoil their vista of a "nice" life; yet without the Shop their life would not only be primitive but sordid in the extreme. It is a strange pass of disordered if not dishonest thinking to which our unemployed visionaries have come.

The Factory, the Works, the Shop—by whatever name you know it—is too close to be fully known but the future will name it more nobly than we of today can dare to think. Mass action like the Crusaders is not disdained today.

From one point of view it would seem that what the world suffers from is not the Factory but the Forum. Industry is based on principles which cannot be violated; they are imbedded in the nature of things. Consequently industry presents a unity of practice and a breadth of service that can scarcely be compared with any other activity of men. Philosophers are all free lances on an ocean of guesses. Religions present a mass of differences and antipathies. Theorists in every field run hither and thither, each a law unto himself, and satisfying himself his only service. But industry, day in and day out, feeds, clothes, comforts, houses, yes educates and churches and intellectualizes the world, and without it none of these services could be fulfilled, nor even our present moderate standard of civilization maintained.

But those facts are not alone. There is also the fact of Efficiency. If service to humanity on equal terms to all will not remove from industry the undeserved stigma of "materialism," it cannot fail to be removed by this fact of Efficiency. For this is but an expression of reverence—it comes to that—for the values of humanity, materials and time. It is the application of the law of the conservation of energy to the human task. It is, to use the homely old saying, using the head to save the heel. In mechanics, it is lifting the burden off persons and putting it on steel. In motion study, it is finding the most direct way to the objective, saving steps, saving wear on the human organism. Efficiency is first intelligent, and being that it follows that it must be humane.

But that is not the whole of its value. Efficiency has not finished its work as a system imposed from without. Unless it is a principle adopted from within, approved by the intelligence and self-certified by experience, it remains exterior and artificial.

Work that is not intelligently directed effort—that is, work that is not pushed forward and directed by the man, instead of the man being pushed by the work—is drudgery and is the stuff of slavery. The old system which false reformers plead for had in it the making of slaves, men being pushed by the work and directed by the boss. The new system of efficiency brings the intelligence and direction of the individual into play, and, by placing him in contact with the fruits of intelligent mastery, tends to develop the element of mastery within him.

And this result in any mind, in any life, is not to be called "materialistic." It is the emergence in a man of that faculty which makes him master of matter.

All men are not voluntarily intelligent; they must be taught. All men do not see the high escape from drudgery in work by putting intelligence into work; they must be taught. All men do not see the wisdom of fitting means to ends, of conserving material (which is sacred as the result of others' labors), of saving that most precious commodity Time; they must be taught. And many men resent being taught. Progress is irksome to them. Here is the origin of the grudge against Efficiency. But even among tens of thousands of such men the benefits of it are apparent.

FROM the time that the sublimest teaching known to man came out of a Carpenter Shop, the Shop has played a leading part in the betterment of humanity. From honest industry arises that unity of practice and breadth of service that feeds, clothes, educates and intellectualizes the world. The system of efficiency that enables men to put intelligence into their work develops the elements of mastery within them, and makes them better and happier men. But all men are not voluntarily intelligent, they must be taught the best means to every end.

The Record of a May Day

Observing and Communing With the Creatures of the Lawns and Woodlands

By ROBERT SPARKS WALKER

THE robin and the cardinal have set the exercises of this May day in motion when the world is filled with their cheerful melodies at 3:30 o'clock in the morning. The wood thrush is nearby and has added his musical contribution to the beginning of the day's exercises. The robins and blackbirds are the first to be seen out on the lawn. The blackbirds walk in a sort of military style probing the ground for worms and turning over every leaf in search of pill bugs. The poor earthworm has little chance of escaping to prevent a tragedy in its life on this May morning. If the blackbird gets a good grip and the worm is somewhat reluctant to release its hold, the bird breaks it in two and is satisfied with its trophy. The joy of the May morning for the blackbird is a tragedy in the life of the little earthworm.

But does it make any difference what becomes of the insignificant little earthworm? Does it amount to little, and is it fit for anything save food for birds and fishes? Not so. This denizen of the soil has added a mighty contribution to our boasted civilization. It has helped us build our cities, establish libraries, schools, churches, good roads, and, moreover, it is largely responsible for feeding and clothing the human race.

Soils must be replenished, else the
food crops fail to grow;
Grave as it may seem, bare
Tragedy has ruled it so;
In the soul's enjoyment of the
things that are good to see,
Silently stern Tragedy brings blessings rich to thee!

Agriculture lies at the basis of all prosperity, at least with us in the United States. To make it a success, the relics of tragedies in the form of dead organic bodies of both animal and plant life must be thoroughly incorporated with the organic earth. The elements must be well distributed. The earthworm is the one chemist who has for centuries worked day and night mixing the soil with the subsoil, the organic matter with the inorganic, that the earth may bring forth her crops in greater abundance. All hats off then to this humble little denizen to which, blind as it is, and even though it is born a worm and dies a worm, we owe much.

Hauls out a white grub.

As the robins and blackbirds on this May morning turn over bits of paper and old leaves, the pill bug with its shell like an armadillo, rolls up into a perfect ball. The birds long ago discovered this little creature's means of protection, and though it may look as round and lifeless as an unsavory pebble, yet they are willing to risk gulping it down even though they are likely to swallow a few real pebbles.

The triple-trunked persimmon tree in my front yard is almost constantly being visited by blue jays, mockers, cardinals, and English sparrows. Seeing these birds alight on the ground or in the tree, the sparrows fly insolently at them in an effort to frighten them away. The blue jays and blackbirds seem to be the only birds that are able to stand their ground this morning.

Watch the punishment.

Down near the trunk of the tree, I have left a pool of pure drinking water, and the birds are going there to quench their thirst and for their morning baths. The mocking bird flies down on the ground and drinks gracefully, taking precautions at each dip to see that no cat or other enemy is near. The other birds fly down one by one, and the pesky sparrows tantalize them by surrounding them. Their contemptuous acts cause the other birds, except the jays and blackbirds, to postpone their baths.

With all his undesirable reputation as an avian citizen, I take my hat off to the blue jay for his courage and true birdliness. He is no coward, and, as far as I have observed, is not a bully. As he wades in the water to enjoy the cool bath, the sparrows surround him. Does he take flight like some other birds? You can see that he has a temper and a sense of right and wrong. The feathers on his head stand erect denoting mental provocation! He does not pause to reason with the sparrows. He dashes at them and gives the hardest peck his strength can afford. I give the manly jay a hearty applause.

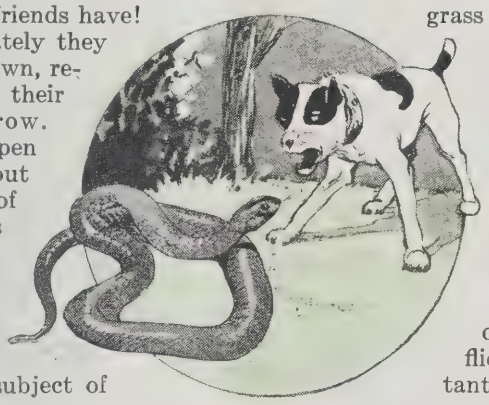
A robin is observed to walk across the lawn with head erect. His beak is pointing at an angle of scarcely forty-five degrees. He travels over the grass by taking a series of quick hops and these little races seem to come in spurts. No other bird has a better trained eye for objects on the ground or for living things in the soil. See how quickly he can turn over a piece of paper, a scrap of old leather or a dead leaf. He catches his game humanely and gracefully. For locating white grubs that lie beneath the surface of the soil the robin should certainly be given the silver cup. How quickly he hops to a clump of blue grass. It may seem absurd to the non-observer that it is possible for any creature to kill or to capture insects in a dignified manner, but there is grace in the robin's every movement.

He pecks down at the base of a tuft of grass that lies so near that I am sure that he can almost here me breathing. He seals a scrutinizing eye on me as well as on the evidence of his breakfast. Spying some signs of a white grub he strikes the soil at the base of the tuft of grass with a heavy blow and drives his pointed beak into the ground. Then quick as a flash of lightning he hits a second blow, throwing his head to the right, then to the left, and so on. These quick plunges throw the dirt out, and then he reaches in and hauls out the white grub. Succeeding with the first attempt at locating the grub, I watch him to ascertain the percentage of his efficiency. He moves speedily up to another tuft, pauses a moment to see that no danger is imminent, and then proceeds to locate signs of another grub. Quick as a flash he has sent the dirt flying on both sides, and behold, he has scored a second prize, and I wonder if his judgment is a hundred per cent accurate!

At this moment his plans are somewhat upset by three sparrows that fly down and harass him in a rude and insolent manner. They have almost

gained my extreme hatred this May morning, for a righteous mind detests a bully and a glutton! The robin pecks at one of the sparrows but does not rush at it with the determination that the jay did. In a few minutes the sparrows have disappeared, probably to look for another visiting bird to tantalize.

Robin keeps up his game, and behold, there come three blackbirds to join him in the grub chase. Such keen eyes these friends have! See how deliberately they walk over the lawn, reminding one of their relative, the crow. They keep an open eye for enemies, but display no signs of fear or uneasiness as the robins do. In fact, their behavior would indicate that their minds are much at ease on the subject of enemies.



The dog grins grotesquely.

But I must keep my eyes on the robin a while longer, for I am to mark his grade this morning as to the degree of his efficiency. Thirty minutes and he is ready to remove to my neighbor's lawn and when I have checked over my record I find that he has made 75 per cent. What a wonderful bird that can make such a high percentage in locating invisible white grubs that lie beneath the sod! When I take my mattock I cannot average more than 25 per cent!

Scarcely has my robin flown when the English sparrows return to harass the blackbirds. They hop around the blackbirds and one slips up and calls one of them all the ugly names known in the avian tongue. There is no word in the English language that will adequately describe the degree of insolence with which the sparrows treat the mocking birds this May morning. As I watch the disgusting behavior of the sparrows, I find it somewhat difficult to repress my anger. But presently I see a female sparrow hop near a blackbird and take the offensive. I am near enough to see the anger flame up in the blackbird's eyes. He makes a quick jump and surprises me by alighting on the sparrow's back, and begins to peck the back of her head. The sparrow spreads her wings out on the ground and while the blackbird hammers away she cries for pity and assistance. The blackbird continues to hammer her on the top of the head, pulling out a mouthful of feathers each time and spitting them out on the ground.

The other sparrows alight on the grass and watch the punishment that is being meted out to their sister, but the blackbird is not touched by the pitiful cries of its victim. The other birds tiptoe around the blackbird but make no effort to secure the release of their sister. Their behavior indicates that they are anxious to help, but they know not how to begin. They fly away, but as the cries of the victim become louder they return and walk close by its side. The blackbird shows no signs of nervousness, but deliberately pauses long enough to look at each sparrow, one at a time, with a mouth full of feathers, as if to say, "Will you now take heed?"

Again he pecks and hammers and finally removes the brains of his victim and throws them out on the grass in the presence of the members of its family. At this moment, the other sparrows take flight. The once noisy crowd of sparrows has become funereally silent. The blackbird steps from his victim, walks around, dips his beak in the soil to clear it of the gore. He then flies away leaving his tantalizer dead on the grass.

For twelve years cardinals, mocking birds, and vesper sparrows have been roosting in the unpruned Amoor River privet hedge in my backyard, alongside my bedroom. I have grown accustomed to their awakening calls as well as their happy good-night messages.

Two catbirds came in yesterday and took up their residence in the same hedge but they are the exclusive occupants this May morning. Their coming has added a tragedy in the lives of the other birds. The catbird is a beautiful singer. His voice is soft and much more mellow than the mocker's. As I slip under the hedge, he frisks about not more than five feet above my head and sings away in a tone so soft and low that were I not so near him, I could scarcely hear his voice. His concert is worth it all.

The catbird with all its sweet strains descends to the undignified mimicking of the cat. His calls cause many birds to give up their haunts to him. The happy home of the cat bird this May morning means tragedy in the lives of other birds.

Humped against huge roots.

Down at my feet, as I write these lines, are hundreds of young plants just making their first leaves on this beautiful May morning. When they burst the old seed husks a few days ago and basked in the sunshine life was full of promise. This morning scores of snails are nipping their tender leaflets.

But the snails will not get them all. Some will be left. When the zinnias, marigolds, the pinks, and petunias blossom, will the tragedies of their early lives be forgotten? Then will come the Devil's Riding Horse who will take his stand by the side of a flower and will so conceal himself that when an insect comes from afar to seek nectar it will be easy for him to grab it up in his strong legs. Suppose that the Devil's Riding Horse lets one pass him by. Down in the flower there sits a spider whose color so matches that of his surroundings that the insect rushes into his arms before it is scarcely aware of what has happened. The joy of the spider means a tragedy in the life of the captured insect.

I go to the grapevines whose fruit is now set. On the tender twigs and leaves appear thousands of plant lice busily engaged in sucking the juice from stems and leaves. The bodies of the plant lice swell with the juice and the two ducts on the back of each insect exude a surplus of honeydew. Over their tiny bodies ants are continually romping, stopping here and there to eat some of the sweetness. The ants are as industriously engaged in attending to their herds as the dairyman out in the country is to his.

Witnessing one tragedy for almost every joy this May morning, I decide to visit the tall timbers far away from the noisy streets. Five miles and a half and I find myself on the banks of the Chickamauga in the midst of a thickly settled agricultural section, where Nature presents peace and rest.

Scarcely do I reach the wooded land before my ears are met with the shrieking cries of a toad in distress. The dog which is pioneering my way rushes to the center of the scene. A blacksnake has a toad halfway in its mouth, but when it sees the dog, releases its victim and the toad leaps joyfully. Its long leaps soon take it safely into a patch of briars. The dog grins grotesquely. The snake is a shiny, ebony-hued reptile, lying near a bed of Indian pinks, sweet Williams, golden ragworts, Venus' looking-glass, and cinquefoil. All is quiet, but the dog again grins grotesquely and rushes madly at the serpent.

A blacksnake is a fast skimmer, but this one halts in the presence of the dog. So far as I know, this is the dog's first experience in tackling a snake. Then how does he know which is the best way to handle a serpent? Why does he show hatred in his eyes and manners? He wastes no time in grabbing the snake near the middle of its body and shakes it so vigorously that he whips the life out of it against the ground. When the dog lets go its hold the snake is dead.

I continue to seek (*Concluded on page 28*)

Where Are Israel's Lost Tribes?

History and Tradition Say the Anglo-Celtic Races of Britain and America

By PAUL TYNER

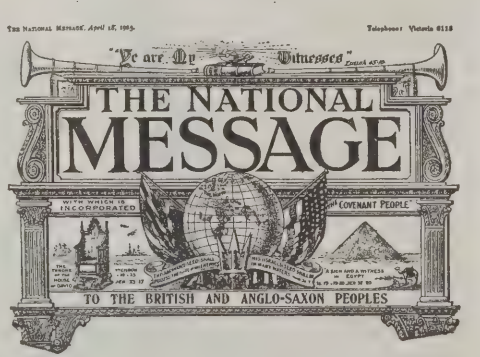
—London.

OVER against the claim of the Jews to be the "Chosen People," to whom dominion over the whole earth is supposed to be promised by the Scriptures of the Old Testament, stands the militant challenge of the British-Israel World Federation. How many readers may know of the beliefs of this international body, it is impossible, of course, to tell, but among those who know, a portion probably regards them as fantastic in the extreme. I frankly confess that they seemed so to me, until recent study and investigation. The age-long problem of what has become of the "Lost Ten Tribes of Israel" is boldly solved by identifying the Anglo-Celtic-Saxon peoples of Britain, America, and Australasia with the House of Israel. This is in itself a startlingly interesting declaration, opening up enormous possibilities. Taking the whole matter out of the dry and dusty realm of antiquarian or ethnological research, it brings it into the realm of practical politics.

> ARE the Jews God's Chosen People? The Bible says that Israel occupies this place.
>
> Who is Israel? The British-Israel World Federation says that Israel comprises the Anglo-Saxon-Celtic peoples of Britain, America, and Australasia.
>
> The Chosen People, therefore, are composed mostly of the Northern White Race—their principal political divisions being Great Britain and the United States.

In 1844, the Rev. F. R. A. Glover began the study of Irish history which led him to the conclusion, first published in 1860, that the Royal House of Britain is descended from King David of Israel. The royal pedigree was first traced to Tea-Tephi, a Hebrew Princess and heiress to the throne of her father, Zedekiah, last of the Hebrew kings. She was brought to Ireland by the Prophet Jeremiah soon after the sacking of Jerusalem by Nebuchadnezzar in 586 B. C., and married Eochaid, the Paramount King of Ireland. Lest the ever-blessed and ever-victorious Irish should become too puffed up by this news, let me add that descent of the present British dynasty is also traced from King David by several collateral lines to a certain Anna who was a daughter of Joseph of Arimathea who was uncle of the Virgin Mary, and from Anna to King Arthur by one line and to King Owen of Wales, founder of the house of Tudor, by another.

Other rather curious ancillary incidents, put forward by writers on "British-Israel Truth" as the result of long and careful search, concern the Coronation Stone now in Westminster Abbey and sometimes called the "Scone" and "The Stone of Destiny." On this Stone, every monarch of the United Kingdom since James I of England and James VI of Scotland has been crowned, and every King of Scotland before that dates back to the first King of Ireland, who was also King of Scotland and who moved his seat from Tara to Edinburgh. It is said to be not only the veritable stone on which Eochaide and Tea-Tephi were crowned at Tara King and Queen of "Israel in the West," but also the stone on which the head of Jacob rested at Beth-El when he dreamed of the ladder reaching from earth to heaven and the ascending and descending angels. One writer, an Irish clergyman who for years lived in view of Tara's Hill, goes so far as to advance arguments to the effect that Jeremiah and the Princess brought to Ireland also with their stone of Beth-El the Ark of the Covenant and the Tables of the Law given to Moses and that these were, by the prophet's direction, hidden in a carefully concealed vault in that historic hill which Moore made famous by his song, "The Harp That Once Through Tara's Halls."



Facsimile of the title on *The National Message*, the organ of British-Israel World Federation.

If we accept this pedigree of the British Royal House, the Kings of Britain have all really been Kings of Israel and the people of Britain and their over-sea descendants form the Nation of Israel—the real "Chosen People." It is also claimed that the great historic admixtures with the Britons due to the invasions of Saxon, Norman and Dane do not alter the main fact, these peoples also belonging to the Ten Tribes, being indeed various individual tribes coming all unknowingly to join the Nation.

Fundamental in the position of British-Israel is the idea that the Bible is a true revelation of the divine will and purpose in history, presenting from Genesis to Revelation the historical development, redemption, and restoration of mankind. This plan hinges on the training, building and development through age-long experience of a great *nation*, even a "Company of Nations," destined, in an ever-expanding empire and with growth to world-wide influence and power, to reap fulfillment of ancient promises and to prepare the way of the Lord and the establishment of the kingdom of justice on earth.

At the headquarters of the British-Israel World Federation, 6 Buckingham Gate, almost opposite Buckingham Palace, I found the editorial and publication as well as the administrative offices of the Federation domiciled in a spacious building, once the town-house of a nobleman, and during the war serving as offices for a special branch of the United States Educational and Publicity Bureau. There Herbert Garrison, F. R. G. S., the Secretary General, received me most courteously and furnished me with much of the information already given. A large room on the ground floor is devoted to the sale of the Federation's numerous publications and I was amazed to discover that the literature of the movement was exceedingly voluminous and various, consisting not only of works on the Bible prophecies and their exposition, but also on history, ethnology, geography, travel, anthropology, and antiquarian lore bearing directly or indirectly on the great theme of Israel's present-day identity and rapidly unfolding destiny. Mr. Garrison, who has himself written much on the subject and who addresses weekly, at the Central Hall, Westminster, large and keenly interested audiences, is an enthusiast with a logical and scientific mind.

He stated:

"This British-Israel teaching will unite and consolidate the English-speaking world as nothing else can. It gives a solid basis for Anglo-Ameri-

can solidarity and places in the hands of these two great peoples (really one in Israel) the mightiest regenerating agency of the age. It proves the inspiration of the Scriptures, silencing infidelity and shaming the scorner, clearing up mysteries and bringing order out of seeming chaos by proving the divine design. In establishing the identity of our race with Israel (not Judah or the Jews, for we differentiate clearly between Israel and Judah) it makes the Bible a new book and one of paramount contemporaneous human interest. With this, the teaching gives the world a new and hopeful outlook on life generally and kills out the deadly pessimism that has so long been rampant.

"We have reached a momentous epoch in human history. Amid much unrest, bewilderment and confusion of thought, people are crying out for light and guidance. This teaching offers today a rock-foundation whereon the doubting and the puzzled can find certainty and stability, for we perceive the Divine Plan running through history, and we recognize it in actual present operation.

"British-Israel is not a sect nor denomination and we hold no Sunday services; but we accept the fundamental truths of the Christian religion and provide a common platform for all denominations. As a matter of fact, our membership includes adherents of all the churches whether of the Anglican or the Non-Conformist communions. Our president is the Right Honorable Lord Gisborough and among our patrons are Her Royal Highness the Princess Alice, Countess of Athlone, granddaughter of Queen Victoria and wife of the present Governor-General of the Union of South Africa; the Earl of Dysart, Lord St. John of Bletsoe, the Bishop of the Falkland Islands, the Right Honorable W. F. Massey, Prime Minister of New Zealand and Major-General C. A. Hadfield. Our congress, held last October in Central Hall, Westminster, brought speakers and adherents from all parts of the world, for you understand the Federation is not merely local but one of all the British-Israel councils, associations and believers everywhere and Americans have large part in it. Addresses were made, among others, by Rev. Dr. Dinsdale T. Young, pastor of the great Central Hall Congregational body, Bishop Vaughan, General Coventry Williams, C. B.; Colonel A. B. Prowse, Dr. Philip Young, Dr. W. Gornold, F. R. A. S.; Commander Roberts, R. N.; the Rev. Merton Smith, the Rev. William Pascoe Goard, F. R. G. S.; Cannon J. C. Hollis, M. A.; Doctor James Mountain, H. A. Marchant, Professor La Grange of the Belgian Royal Academy and Director of the Royal Observatory at Brussels; T. W. Plant, the Honorable Miss Akers Douglas and the Rev. G. H. Lancaster, M. A. Among those accepting our teaching may be named Queen Mary's mother, the Duchess of Teck; the Marchioness of Waterford, Earl Roberts, Admirals, Lords Fisher, Roberts, and Beresford."

Before leaving the British-Israel headquarters I was further privileged to have an extremely interesting talk with a leading personality in its world-wide work. This was the Rev. William Pasco Goard, chief missioner of the movement and editor of its international organ, the *National Message*, a bright and interesting weekly. He was introduced to me by Mr. Garrison as one thoroughly conversant with all the ins and outs of the movements and particularly well qualified to speak on its bases and beginnings. In the course of the interview, Mr. Goard said:

"The beginnings of Israelitish occupation of Britain go back to seven-

REV. WILLIAM PASCOE GOARD, F. R. G. S., Chief Missioner of the British-Israel World Federation.

teen hundred years before Christ. This is established by ancient British records recently unearthed by scholars and shows that the larger branch of the House of Israel was established in these Islands before Joshua led the smaller branch into Palestine. The records had long been buried out of sight by alien influences who even tried to obstruct efforts made to uncover the beginnings of British history which disclosed the truth. Israel is distinctly a *NATION* and the Bible is, first and foremost, a record of *the national history of a race* which during 4,000 years of its now authenticated history only occupied Palestine one thousand years, entering that land in the year 1400 B. C., and coming out of it in the year 400 B. C. Even during this occupation, there was a constant stream of immigration into Palestine from other races and a flood of refugees from Babylon and Assyria and Egypt. The larger proportion of the Israelites sailed to Britain and settled in Ireland. They formed also the original stock of the populations of Britanny, Spain, Normandy, Gascony, Scandinavia, and Cornwall.

"The throne of David was established in Jerusalem in the year 1100 B. C., and continued there until 588 B. C. It was then uprooted, ten of the tribes taking the name of 'Israel' and the remaining two that of 'Judah.' After this separation the Jews never again became citizens of the Nation of Israel. So for more than 2,500 years they have been strangers without the pale of Israel—*Goyim*, as they erroneously term the Christians of British-Israel's race."

"There is an impression that this movement identifies the Anglo-Saxon race with only two of the ten tribes, with Ephraim and Manasseh," I remarked. "Would not that leave eight tribes to be accounted for?"

"The ancient British," Mr. Goard replied, "were made up of fragments of all the ten tribes and as late as Our Lord's time they had established a populous and thriving colony in these Isles. The Jews then were but a 'remnant' of the House of Judah and the bulk of the ten tribes were still 'beyond the Euphrates.' That is, they were scattered through Armenia and other parts of Asia Minor and along the shores of the Black Sea. So the British Isles were left to bear the brunt of the Roman attack. Later the Saxons came into this country and as they were also of the Ten Tribes, they advanced civilization in this country by about a thousand years. The Tribe of Benjamin became separated from the Jews on the Fall of Jerusalem, the Romans under Titus allowing them to pass from the captured city through the opened ranks of the legionaries. Another great section of the tribes came to Britain when the Normans joined their kindred here under Rolla, and still another with the invasion of the Danes under Hengist and Horsa.

"Britain is the Israel of the prophecies and not only heir to the possessions promised by God to Israel, but in actual present possession. The Jews for many generations have been mistakenly convinced that the British were Gentiles and that therefore they were justified by the Law of Moses in taking from them by any indirection, as in 'spoiling the Egyptians.' The next great war—the real Armageddon—will be fought on that issue. To tell the average commercial Jew that the British are Israel drives him mad. Why? Because he realizes that—again according to his ancient and unchanging law—if Britain and the United States are Israel he must make restitution of all that he has robbed and cheated the 'Goyim' out of, *with an addition of twenty per cent!* That is his own law and he knows it. This judgment and operation of the Law is what the Jew fears more than anything else that could happen to him. Instead of applying the 'Law of the Brother' in his dealings with British and American Christians, he has applied the 'Law of the Stranger.' It should be noted that the *(Concluded on page 27)*

Can You Think on Your Feet?

Some Essentials of Good Oratory and Some Peculiarities of Good Orators

By THOMAS L. MASSON

I HAVE heard a great number of our public speakers, not only of today but of the last generation, and in general they can be divided into two classes: those who appeal to the emotions and those who appeal to the mind. The latter class can be summed up in the remark made by a woman admirer of Henry James, after she had heard him talk: "I didn't understand a word he said but wasn't it wonderful?"

I think on all counts that Bob Ingersoll, whom I knew personally, was the best speaker I ever heard, for he united both methods. I once heard him give his lecture on Shakespeare in the Academy of Music, Brooklyn, and although I sat way back in the gallery in a crowded house I heard easily every word he said. There was something intimate and human about his appearance that is indescribable. He was quite tall, well-proportioned, with a round, bald head. His phrasing and his humor were both inimitable. I do not suppose his lecture on Shakespeare would pass current among the highbrows, yet he gave me a much better idea of the immortal bard than I got from any book I had ever read; especially where he said Shakespeare's immortal phrase, "there is no darkness but ignorance," was put into the mouth of a clown, so prodigal was Shakespeare of ideas.

A friend of mine told me an interesting incident about Joseph Conrad, who visited America a few months before his death. They were in an automobile touring through New England, when the car took fire, and they were obliged to wait for several hours on the road for repairs. Conrad brought forth a copy of Macaulay's speeches on the reform bill, and read them aloud with great delight. This interested me so that I got down Macaulay's speeches to see why Conrad liked them so well. It is recorded that Macaulay's delivery was poor. But he had an astonishing memory, and was able to present his entire speech practically as he had written it.

Among moderns, Chauncey Depew has always been notable for his memory. Melville Stone told me he once heard Depew deliver a speech which he had dictated a few hours before, and which he had barely time to read over once in the typewritten manuscript, which he gave to Stone. Stone said the speech lasted nearly if not quite an hour and it was word for word as Depew dictated it.

Among all our Presidents I suppose that Woodrow Wilson—with, of course, the exception of Lincoln—would rank the highest, as our presidency has developed very few orators. Wilson made few gestures. He displayed no passion. Yet he evidently paid great attention to the form of his address, and I have always thought he modeled his talks on the method laid down by Cicero. He arranged his ideas beforehand in sequence, and took pains with his peroration. He came to my house once before he delivered a political speech, and, after telling me how nervous he always felt before speaking, was as eloquent as I ever heard him, especially where in the end he drew a picture of the American flag which greatly moved the audience, so much so that when he sat down people came up to him with tears in their eyes.

Within the past few years there has been a great revival of public speaking in this country. In many towns classes have been formed, and a widespread desire shown among both men and women, to be able to think on one's feet. There are various reasons for this. One is due to the development of the art of salesmanship, and the general attention paid to the business value of self-expression. Another reason is the spread of the get-together idea, as externalized by the Rotary and the Lions clubs, and many others. Furthermore, woman suffrage brought with it a host of woman orators. This, together with the profits made by lecturers, has stimulated the ambition of the American people to express themselves individually. The whole movement is very significant and interesting. Also, on the part of what may be termed the audience-mass as a whole, has come a great curiosity to be informed upon various matters by those who are experts. Thus a man who has acquired the reputation for knowing any particular thing is almost certain to be urged to talk about it.

Is there any short cut to oratory? I do not think so. One of the great difficulties to the novice is the inability beforehand to understand just what facing an audience really means. It is only when the final moment comes, when one steps out on the platform, that the horrible doubt, the narcotic speech-robbing effect

It is only when the final moment comes that the narcotic speech-robbing effect sweeps over one.

sweeps over one. In that swift moment, like a flash, comes the hideous feeling of remorse over one's silly confidence and lack of preparation. Yet it is a well-known rule among trained public speakers that learning one's speech beforehand word for word is a very risky business. Mark Twain, early in his career, learned this bitter lesson when he memorized a speech before a select group of literary men, including Oliver Wendell Holmes, the poet Longfellow, Emerson, and others. His speech was too flippant for such a dignified crowd, and yet he had no other and was obliged to deliver it to the tragic end. This oratorical debacle, however, was due to the fact that he had only one speech. Later, as he became more experienced, he acquired—as most speakers acquire—a number of different openings, which enabled him to fit his talk to the atmosphere of his audience. He generally learned his talk beforehand, and then resorted to table articles to recall the order of his ideas; for instance, a saltcellar standing for the beginning, a cup and saucer for another, and so forth. Broadly speaking, this was the method advocated by Cicero, who, as I recall his observations, used architecture for his scheme. In an oration he would assume that the various parts were like a building.

The effect of oratory is very much overestimated.

Those who have listened to humorous speeches no doubt think they are offhand. The truth is that all the successful humorous speakers I know take infinite pains beforehand and generally memorize. I heard Mark Twain on his seventieth birthday dinner in New York. His speech sounded as if it were offhand, but he had been practicing it for weeks. The same thing was true of Simeon Ford, who was at one time by far the best after-dinner speaker in America. He was always able to "size up" his audience beforehand, as it was generally a collection of men engaged in the hotel business, he himself being the proprietor of a large hotel in New York. But where the audience was in another business as, for instance, in his talk to booksellers, he adapted himself to their ideas and, because of his solemn manner, invariably brought down the house. Irvin Cobb, at present one of our most successful humorous speakers, takes great care beforehand. He is one of the few humorous speakers who tell really good stories, his Negro dialect character sketches—for they are really more than mere anecdotes—being genuine works of art.

I have always thought that the universal American habit among public speakers of telling stories was due to our national self-consciousness, which compels our speakers to fall back on props. Nothing is more effective in a talk than a good story in the right place, and nothing is more disheartening than a bad story in the wrong place. Beginners in oratory should avoid telling stories until they are able to do so without depending upon them. Novices are apt to think that if they can open with some bright saying or anecdote they will have gone a long way toward success. The truth is almost always otherwise.

If a talker begins well, unless he keeps up to this level throughout, the effect is bad. But if he begins haltingly and then slowly gets better as he goes along, the audience rises immediately to his thought and this restores the confidence necessary for him to sustain himself. It is very difficult to explain this growing confidence. It can never be relied upon in advance. Also, audiences differ so much in their atmosphere that what will "go over" big with one audience will be received coldly by another. I once spoke impromptu to a New York audience that was in a gay mood, and although my talk was inconsequential and delivered on the spur of the moment, it caught them and was such a success that I determined to repeat it on a later occasion in the country. Just before I began, however, an elderly gentleman came forward and said: "I heard you in New York last week, and like you so much that here I am again." I was so disconcerted that I made a complete failure, and for weeks after could not think of that evening without a sense of horror.

Any person of ordinary intelligence and education may become a good speaker.

Charles Dickens was a great talker, and owing to his fine dramatic ability in addition, his reading from his own books was an event in anyone's life who heard him. When he visited this country in 1842, a great banquet was tendered to him, and Washington Irving was asked to preside. Irving, who was no speaker, looked forward with dread to the evening and kept saying, "I shall certainly break down." Forster, Dickens' biographer, thus describes what occurred:

"Mr. Irving rose; and the deafening and long continued applause by no means lessened his apprehension. He began in his pleasant voice; got through two or three sentences pretty easily, but in the next hesitated; and after one or two attempts to go on, gave it up, with a graceful allusion to the tournament and the troop of knights all armed and eager for the fray; and ended with the toast, Charles Dickens, the guest of the Nation. 'There,' he said, as he resumed his seat amid applause as great as had greeted his rising, 'There! I told you I should break down, and I've done it!' "

When Matthew Arnold visited this country in 1886, he made a poor impression and after his first lecture had to be coached. The dean of one of our most prominent universities told me that they engaged Matthew Arnold to lecture at the university. Before he began his lecture he insisted upon being paid in cash; he would not accept a check and they had to scurry around and get the money.

When Mrs. Herbert (Margot) Asquith came to this country a few years ago, her first lecture was in Carnegie Hall, New York. The curtain rose and Mrs. Asquith was discovered sitting in a chair at a table. She began telling a story about a horse that had thrown her. Her voice wasn't good, and someone cried "louder." A little later a woman in the gallery leaned over and said in a loud voice that she was going home. Mrs. Asquith replied from the stage that she didn't blame her. I heard her a few weeks later, however, and she was very much better. She held a manuscript in her hand and referred to it con-

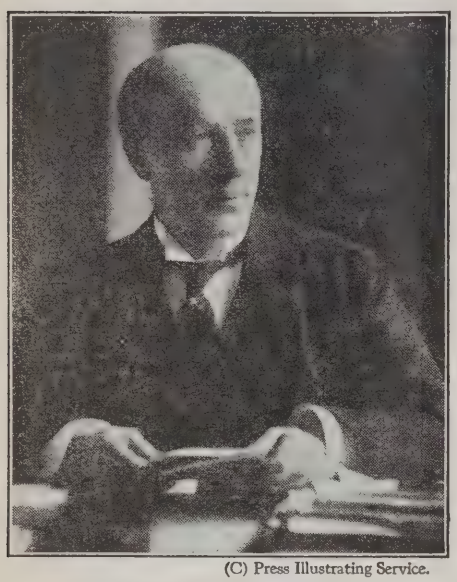
Gold or Paper—Which Is Better?

How Wall Street Wiles Affect Bank of England Bullion



(C) Press Illustrating Service.
REGINALD M'KENNA,
Who has been elected chairman of the London City and Midland Bank.

By MAURICE MANNING

This is the second and concluding article on the subject of the Gold Standard.

WALL Street controls the banks of New York, the banks of New York dominate the banks of the whole country through Paul Warburg's Federal Reserve Board, while the agriculture and the manufacturing industries of the country are dependent on the local banks.

A "Currency Expert" rises up in London at this juncture to explain the popular idea that a "return to the gold standard" means a resumption of the use of gold sovereigns and half-sovereigns is all wrong. All this gold coin was called in at the outset of the war in 1914, and a restored gold standard has no necessary connection with its reissue to take the place of the government paper currency which has proved so satisfactory and popular. All that such restoration means, he says, is that we should be ready to pay our foreign indebtedness as it normally occurs in the course of commerce in hard gold —a thing England has not done since 1914. It means that any foreign firm in any part of the world who has an admitted claim on any British firm in Great Britain, whether it takes the form of a bond, or a bill of acceptance, could collect it through the usual channels, and, in the ultimate resort, in the form of gold; or that any one buying British currency could exchange it anywhere in the world for gold. Since 1914, such a creditor could not do this, because the law then forbade the export of British gold, which lay, as it lies now, to the tune of 120-odd millions sterling, locked up in English bank vaults.

The gold standard can be restored quite effectually without affecting the internal currency of Britain, and if the people prefer the use of the Treasury notes they can do so. The public simply holds and uses the paper money while the banks keep the gold!

It is said, however, that the banks intend to make the abolition of the Treasury notes part of the new scheme. This for several reasons: First, these notes offer too convincing an object lesson of the fact that a gold or gold-based currency is as unnecessary as it is expensive and that it is peculiarly subject to monopoly manipulation. Second, properly regulated paper currency menaces the banks' monopoly of the mechanism of exchange. Third, there is put out an idea that the banks really want to unload the gold in their vaults, because holding gold is an expensive process, for which the public instead of the banks will pay if the gold can be put into circulation. Gold basis or no gold basis for the currency issued by the government, no question arises as to the "gold reserve" of the Bank of England, or of the standing of the Bank of England notes issued against it. This generally accepted form of currency long preceded the war, continued during the war and has survived it. If the Bank can substitute its circulating notes for the present Treasury notes, its "Earnings" will be multiplied several times.

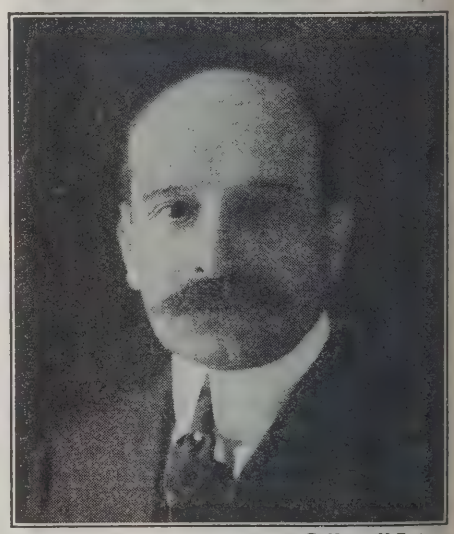
One serious objection to the imposition of a gold instead of a paper currency on the people of England at this time is the cost to the taxpayers of any such transaction. The Treasury notes now in circulation amount to £281,000,000, while the gold in the banks amounts to £123,000,000. To restore the gold currency, it would be necessary to buy abroad—that is, in the United States—£155,000,000 of gold bullion. That means the taxpayer would have to pay something like ten million pounds a year for the privilege of exchanging his Treasury notes for sovereigns in no way more valuable.

Certain by-products of the raising of the bank rate are attracting distinct attention. There is a government floating debt of nearly £800,000,000. With the rise in the Bank of England's rate, the rate of interest on this debt must also be raised one per cent—at a cost to the nation of eight million pounds. This is hardly a good showing for the Chancellor of the Exchequer to whom the nation is turning at this time for relief from crushing public burdens of taxation.

Another thing, as the joint-stock and private banks generally lend money at a rate of one per cent higher than that asked by the Bank of England, the tax on British industry increases accordingly. British industry is borrowing from the joint-stock banks about one thousand million pounds a year. One per cent advance on this amount means a fine to the business community of an extra ten million pounds ($50,000,000) yearly. As a writer in the *Daily Express* puts it, the bank rate advance "costs the nation eighteen million a year as the price of being dragged at the tail of American finance."

Much of the attack on the action of the Bank is really leveled at Winston Churchill, the Chancellor of the Exchequer, who has many enemies in all parties. His assertion that the Bank's action was purely a matter of its own domestic policy with which he had nothing to do and could not properly interfere is questioned. It is said that the governor and company of the Bank of England, being a body elected by no one and responsible to no one, the real master of the Bank, and so of the rates of interest in England, is the Chancellor of the Exchequer who has under his hand $800,000,000 of floating debt on which he has power to fix the rates of interest, so fixing the rate for all loans. Besides, the Chancellor controls a managed currency, so that he can inflate or deflate the volume of money and with it the values of securities as he chooses.

This is plainly *ex parte* pleading. It leaves out of account the power of



(C) Harris & Ewing
PAUL WARBURG.

the lender not the borrower to fix the rate of interest, even when government is the borrower. And it ignores the fact that the real master and dictator in the world's loan markets today is the House of Rothschild, of which the Bank of England is simply an appanage.

Housing authorities throughout the country complain that the rise in the bank rate will have the effect of increas-

ing the rent of houses which are built while the present rate is maintained, as many small builders carry on largely with borrowed money. One housing expert estimates that the increased charge for money will be equivalent to an increase of 25 per cent in the labor cost and will involve a corresponding increase in the rentals of houses, so crossing the narrow margin of profit that makes the building of small houses for the workers possible.

In a debate on the rent restriction bill in the House of Commons, Mr. Wheatley, minister of health in the late Labor government, declared that the increase in the bank rate meant an increase of about £3 a year in the rents of small houses. He put the increased costs occasioned by one per cent dearer money as equivalent to an increase of 50 per cent in the wages of builders.

Reginald M'Kenna, chairman of the Midland Bank and a former Chancellor of the Exchequer, seems to wobble a bit. Addressing the commercial committee of the House of Commons recently, he dealt with the pros and cons of the question of the restoration of the gold standard and showed that he has not been entirely in agreement with the action of the Bank of England; but he expressed the belief that on balance gold will come into Britain without any obligation on Britain's part to attract it by high money rates.

This belief he based on the assertion that America will be a willing seller rather than a willing buyer of gold and that the output of the metal is more than sufficient to meet all the world's demands. Every purchase of this gold by the Bank of England, he said, will lead to *an expansion of credit.* "But," Mr. M'Kenna went on, "the effect of our past policy in attempting to force the appreciation of our currency, whether by restricting credit or by charging higher rates for money than are current in the United States, or by discountenancing the issue of foreign loans on our market, has been to create a situation which may have a serious reaction when we first get back to gold." He declared himself of the opinion that these were only matters of temporary importance and that "reversion to the gold standard will eventually be attended by an influx of gold and an improvement in trade."

But Mr. M'Kenna, like Mr. Montagu Collet Norman, favors a reversion to the gold standard with a string to it. The gold must be kept in the banks and the raw material of money in which the banks deal must, on the Federal Reserve plan, be controlled while increased in volume to a tremendous extent at the will of the banks. The "gold basis," in fact, is simply to figure as the fictitious measure of a fictitious unit of value while the banks are to buy and sell the mercantile credits supplied by the borrowers! "If with the reversion to the gold standard," Mr. M'Kenna concluded, "the gold sovereign were allowed to pass into circulation, it would be disastrous to our trade prospects." Plainly, credit has displaced *cash* as the world's medium of exchange!

Bankers and economists generally in England are agreed that the restoration of the gold standard in the world can only be achieved by England, and that England, in this matter, is absolutely dependent on the assistance of the United States, which means the action of the Federal Reserve Board, now indisputably the most powerful financial organization in the world.

What is the attitude of the Coolidge Administration on this point? In an address at the farewell dinner given to him by the Pilgrims on the eve of his return to America to take up the duties of Secretary of State, Frank B. Kellogg said:

> "I look forward with hope to the day when there will be a free gold market in England and in all Europe. In answer to a distinguished London banker who recently asked me what we were going to do with our gold, I answered, 'Bring the pound sterling to a gold basis and restore the currencies of Europe and the gold question will settle itself.'"

The Responsibility of Being Led

(*Continued from page 4*)

youth of our country, and the care of maternity are all directed by bureaus at Washington, we shall have arrived at the condition concerning which our great historian, John Fiske, warned us in his "Critical Period of American History":

"If the day should ever arrive (which God forbid) when the people of the different parts of our country should allow their local affairs to be administered from Washington—on that day the progressive political career of the American people will have come to an end, and the hopes that have been built upon it for the future happiness and prosperity of mankind will be wrecked forever."

Bureaucracy is, besides, the most expensive form of government. Under it taxes can be and are raised indefinitely and this, too, will tend to increase ill-will and hatred toward our government.

A bureau, once formed, seems to be immortal. Its principal aim is to perpetuate itself. As President Coolidge has pertinently said: "It is a difficult task to separate people from the Federal service." A less dignified commentator says: "It is easier for 10 camels, 25 elephants, and 16 giraffes, all marching abreast, to pass through the eye of a needle than for a Federal officeholder to give up his job." Should not American women, then, be a little less ready to follow their leaders in indorsing measures which would enormously and permanently increase the size, cost, and menace of bureaucracy?

I have said to various members of the League of Women Voters: "Do you really want to change our American form of government into a bureaucracy, after the object lessons which Germany and Russia have given us of the evils of that form of government?" Some of them do not know enough of government to understand what I mean, but others have said indignantly: "Of course not. I don't believe in these bureaucratic measures." "Then," I say, "do you think it is honest to allow your leaders to count you as indorsing them, and to hold you as a threat before Congressmen as one of the 12,000,000 whom they represent?" I have never yet found one who had an answer to this question.

For our own self-respect, we women should rejoice in every evidence that not all organized women can be led like sheep, but that some do their own thinking.

During the campaign in Massachusetts for and against the Child Labor Amendment, a debate was held at the Y. W. C. A. rooms in one of the large cities. Before an audience of more than 150 women, speakers stated the arguments for and against the amendment. At the close of the debate the presiding officer, herself an advocate of the amendment, said: "Now we will take a vote on the question. All those in favor please raise their hands." To her great amazement, evidently, only a dozen hands were raised. Without concealing her annoyance she said sharply: "Vote! Vote! Why don't you vote?" Thus urged a few more hands were slowly raised, but not enough to please her. "Well, then," she said, "*I'll* vote!" Raising her hand high, she kept it up while still urging her hearers to "vote." At last, when the situation was rapidly becoming ludicrous, she counted the raised hands, which numbered 23. Then she called for the negative votes, and when she saw their overwhelming majority, she said crossly: "It's no use counting them." It probably took some courage for these women to vote against the indorsement of their association, and against the attempted coercion of their president, but they stood by their convictions and did it.

As women begin to understand more clearly the real nature of the legislation which the women's lobby at Washington is demanding, many of them are rebelling against such leadership. There has been a veritable "Declaration of Independence" on the part of certain club women of New Hampshire, which is truly refreshing. In New Hampshire, as in other states, women have been

divided into two camps over the Child Labor Amendment. The legislative chairman of the New Hampshire Federation of Clubs happens to be a member of the New Hampshire legislature, and also a bitter partisan for the amendment. The impression was given, either intentionally or unintentionally, that she represented the State Federation in advocating the measure, and she constantly gave out to the press extraordinary propaganda. One of her statements was that 89,000 children were working in the cotton mills in Georgia. Statistics show that the Georgia mills employ only 45,000 workers, including men, women, and children! Her statements, many of them easily disproved, reacted to the discredit of the State Federation and protests were voiced by club members.

The Citizens' Committee which opposed the amendment in New Hampshire included in its membership some well-known club women who refused to allow the public to be misled as to their views on the subject. They issued two leaflets in protest. The first said: "The Women's Committee is bringing pressure to bear on state legislatures and the general public for ratification. They claim a backing of twelve million women. Whence comes the authority for this claim? We women at home know that little if any effort has ever been made to ascertain our convictions on the subject. But we women, the rank and file of the membership, alone hold the authority for such backing. We have not given it. In New Hampshire we cannot find that any state organization has taken action in favor of the amendment. In view of these facts, the claims of the Women's Committee are absurd if not actually dishonest."

The second leaflet takes up the local issue in vigorous fashion. It says:

"Has the Legislative Committee of the New Hampshire Federation of Women's Clubs authority to state that 12,000 club women of N. H. endorse ratification of the 20th Amendment?

NO

"The question of ratification has never been presented at a Federation meeting. Neither has there been any general referendum on the question among the 12,000 club women.

"The only official indorsement of the 20th Amendment, in the name of the Federation, has been by vote of the Executive Board, at a meeting in November, 1924. The Executive Board consists of 28 members (5 members constituting a quorum). This vote of indorsement was in nature of a recommendation only; it had no authority to commit the 12,000 club women of the State to this legislative measure. The method of obtaining such authority for influence with the Legislature is fully provided for.

"At the annual meeting of the Federation in Milford, May, 1923, the duly elected delegates of the federated clubs voted as follows:

"That all legislation pertaining to those matters which have engaged the attention of the N. H. State Federation be presented at the Presidents' Conference to be held early in January the year of the biennial session of the Legislature.

"Endorsement of any measure at this meeting shall direct the future action of the Legislative Committee of the N. H. State Federation."

(Secretary's Record)

"In an editorial in the December Federation Bulletin, each club president was reminded of this ruling and requested to conduct a full discussion of legislative measures (including the Amendment).

"A vote of endorsement of the club will instruct the officials who attend the Presidents' Conference to vote for them (i. e. legislative measures) as Federation measures."

(Federation Bulletin, December, 1924, p. 6.)

"On January 28, 1925, the Presidents' Conference was held in Concord.

THE EXPECTED VOTE WAS NOT TAKEN

"There was, however, evidence of decided opposition to the Amendment on the part of club presidents in attendance.

"According to the Federation ruling above quoted an endorsement at the Presidents' Conference directs the (*Concluded on page 23*)

What Does Our Army Do When Not Fighting?

(*Continued from page 8*)

Although the Republic of San Domingo and Haiti are not United States possessions, the Army has supervision and control of the customs' receivership, involving the annual expenditure of more than $22,000,000. The history of the Philippines, Cuba, Porto Rico, and Panama is the story of the conflict between civilized forces and those of reaction and decadence. That the civilized forces have emerged victorious is largely due to the intelligent administration and constructive talent of our Army.

Gas warfare is a development of the late war. The Chemical Warfare Service is not only experimenting to develop the use of gas for war purposes, but is endeavoring to make its discoveries of great commercial and medical value. Mustard gas is being employed experimentally with great hope that it may prove a valuable retardant in the treatment of tuberculosis. Because the employes of gas factories during the war appeared to be immune from the ravages of influenza, it is expected that a gas treatment will be developed as a cure to that disease. One of the greatest problems of sanitation is that of effective and safe fumigation. Tear gas, with a concentration of only one-eighth the strength which would injure human life, has been found by the Chemical Warfare Service to furnish effective fumigation. This branch of the service is also coöperating with the Department of Agriculture and the Air Service, in an effort to exterminate the boll weevil and other insects which annually destroy millions of dollars' worth of property. The Chemical Warfare Service is coöperating with the Navy Department in search of a compound that will prevent the collection of barnacles on ship bottoms; experiments are being conducted to prevent the destructive action of the teredo and limnoria on piling and other wooden construction in sea water.

One of the most important functions of the War Department is the improvement of waterways for the interstate and foreign commerce in the United States and her possessions. Since the inauguration of this work in 1824, the initial cost of the improvements, with their maintenance and operation, exceeds more than $1,000,000,000. Nearly three-quarters of this amount has been expended on the improvement of thirty of our principal ports.

Frequently, we hear the complaint that our Army costs too much money. In a year, we spend for candy and chewing gum three times the cost of our Army; our tobacco bill is four times as great; theaters, cabarets, and similar amusements cost us three times as much. If we followed the average policy of the world, we would have a standing Army of one million men, with a proportionate increase in cost.

The expense of maintaining our Army should be looked upon as the premium we pay for insurance against war, and the threats of war. When we consider the protection the Army affords this country and its possessions; how as pioneer it expedited the early exploitation of our great natural resources; its important rôle in the development of some of our essential industries; and its contributions to science and the health of the nation—then we must realize that the benefits derived fully justify the cost.

Toil and Trouble at Washington

Some Pickings From the Political Pot, Palatable and Otherwise

By M'KEE BARCLAY

THE political pot has ceased to bubble.

The Senators and Congressmen have scattered to the far-away home bailiwicks, the Republican elephant dozes at Washington and the leaderless Democratic donkey almost hopelessly waits for the call of "His Master's Voice." Since the passing of Woodrow Wilson no man has arisen from the *hoi polloi* or from the ranks of the lesser leaders whose personality or whose policies could give the assurance of attracting the sort of following that would make its chief stand out from his fellows. The Kilkenny fight staged in Madison Square Garden started so many private feuds that the Democratic party has a plethora of factional captains but no real leaders. The much-talked-of "Conference of Leaders" would at this time mean only the gathering together of hatchet-carrying and gun-toting factionists. The healing balm of elapsed time has not yet done its work. There are at the present no compelling incentives to action by the demoralized leaders of the feudists. No immediate rewards are in sight. The paralysis that resulted from the stroke of last November must more completely disappear before it is advisable to make an attempt at peace pipe smoking.

The politicians of the Democratic party should understand that no project to *manufacture* harmony will succeed. Any effort to concoct the synthetic sort will be wasted.

The business world is wondering just what tax-reducing agencies will be set in motion between now and next December when our national lawmakers assemble again.

No one denies that Mr. Coolidge has an able adviser in the person of his Secretary of the Treasury, but Mr. Mellon's influence for good as the maker of Treasury policies has several handicaps attached to it. Unfortunately for him, great publicity has been given the charge, made by the Federal Trade Commission and backed by his fellow Cabinet member, Attorney-General Stone, that his Aluminum Company of America has been guilty of iniquitous practices in restraint of trade. This and other accusations have prevented Mr. Mellon from standing as a purely disinterested adjuster of taxes. Whatever Mr. Coolidge attempts to do to relieve the tax situation must, to be successful, have the backing of a united public opinion. The President would probably be better off had he a man of ordinary attainments and moderate wealth as titular head of the Treasury, with the great Pittsburgh expert standing by as unofficial adviser.

We are now becalmed in the political doldrums, latitude unknown, longitude uncertain. The barometer shows no signs of weather disturbances in the way of election typhoons or congressional session thunderstorms.

As these quiet *ad interim* days glide smoothly by, with no turbulent and unsettled election conditions for Business to rail at, we should be in a position to congratulate ourselves on the gratifying progress which the nation is making in its way along the "readjustment" route to prosperity. But just now there are little evidences of occasional uneasiness among careful business men at the frequency of the optimistic statements of business conditions by financial leaders and captains of industry which are finding their way into print. Those who have had to buy with increasing care and tighten up on overhead are beginning to become slightly suspicious of the over-cheery prognostications of general prosperity. While they are not trying to tune in on the song of the crêpe-hanger they do not enjoy the creepy sensation produced by the shrill whistling of the fellow who is passing a graveyard. Some of them are hoping that Congress will meet early in the autumn for a readjustment of taxes and that this or something else, as yet undefined, will do the work that persistent propaganda has failed to do.

Who has the President's ear?

"Ear, Ear, Who's Got the Ear?" seems to be the popular indoor game in Washington just now. Everybody knows that Senator Butler has had the Coolidge ear since 'way back in days of yore; Mr. Stearns, the President's fatherly adviser, has also had the President's ear; if we may believe the newspapers, Mr. Hoover has his ear, and in days past Mr. Mellon was credited with being its custodian.

However carelessly the distribution of ears may have been handled, the most significant feature of the matter is that when the time comes for pondering over presidential policies the ear into which Sponsor Butler talks listens best. While Mr. Hoover seems to concern himself only with matters that affect Herbert Hoover, Mr. Butler is consumed with an all-enveloping zeal for the welfare of Mr. Coolidge, the President, while Mr. Stearns is only concerned with the comfort and well-being of Coolidge, the Man. While Hoover has been raking men, bureaus, commissions, and departments into his maw, Butler has not been letting the clover grow under his feet. Hoover goes at his machine-building job shod with thick-soled, hobnailed brogans and when he essays to tiptoe, as he does at times, he is about as noiseless as a wooden-legged man dancing a jig on a tin roof. Butler wears shoes with sponge-rubber soles. He confines himself to the business of warwicking and mentoring—with results of dubious advantage to the mentored.

Caesar had his Brutus, McKinley his Hanna and Coolidge *may* profit by their example.

No one who knows Messrs. Mellon, Hoover, and Butler doubts for a moment that whatever of liberal declaration or action has emanated from the White House (Concluded on page 30)

The Leaderless Party: "I don't hear a thing but silence."

America's Unpaid Debt to France

Obligation Assumed After French Pirates Had Robbed American Ships

By WILLIAM ATHERTON DU PUY

"FRENCH Spoliations Claims" is little more than a phrase in the average mind, but to Calvin Coolidge, Warren G. Harding, Woodrow Wilson, William Howard Taft, and the United States Court of Claims it stands for debts that the government has owed for 125 years but which it still fails to pay. President Coolidge reminded the recent Congress of this debt in his first message to it and asked that it provide for the payment of these claims. It has gone into history without action to that end.

The persons to whom the money is due are the great-grandchildren and great-great-grandchildren of American citizens whose ships were unlawfully seized by French privateers during that four years of near-war, 1796-1800, which existed between this country and France. The French admitted the obligation, but it was assumed by the United States as part of the bargain of settlement between the two nations. Half of it was paid after a delay of a hundred years. The rest still stands.

The story of these spoliations, a chapter in American history that is so embarrassing that it is usually avoided, is a strange one, quite difficult to understand. It is the story of an infant nation that had not yet found itself, dazed by the struggle for independence through which it had just passed, floundering in a maze of difficulties, threatened by the great powers of the earth, torn by factionism at home, humiliated. It is the story of acts on its part that seem indefensible, yet acts but for which the United States would today, in all probability, be bounded on the west by the Ohio and Mississippi rivers.

The Struggles of an Infant Nation

The United States wrote her first treaty with any nation in 1778, two years after the Declaration of Independence. The treaty was with France and gained the support of that nation in the war for independence. In return, the United States pledged to support France in any future war she might have with Great Britain, to defend her possessions on this side of the Atlantic. She agreed to make no similar treaty with any other nation.

Yet, in 1794, under pressure that she seemed not able to resist, she signed a similar treaty with the other party to the triangle, Great Britain. Britain would have come down on her from the north if she had not. She would have been in great danger of having her western territory taken from her.

In 1796, after the French had chopped off the head of Louis XVI, and France, like America, had become a republic, she precipitated a war with England. She expected the United States to come to her support, but that country failed to act. She expected her specifically to defend the French possessions in the West Indies but she made no move to do so. France broke off relations. Then she sent out her privateers, instructed them to seize all American merchantmen, on whatever pretext they chose. These privateers were already preying on English shipping. With the addition of American ships the hunting became rich. Privateering became rare sport for French adventurers.

French Seized Many American Ships

For four years the French took American ships where they found them. They placed technical charges against them, charges that had no standing in prize courts. They were charged with having touched at British ports, a thing which, under international law, they had a perfect right to do. They were charged with having violated some French-made regulation of which they had never heard, with having defective crew, with any sort of trumped-up offense. They were taken into French ports, the majority of them to the Island of Guadeloupe, out there beyond Porto Rico, which was privateer headquarters. The judges usually shared in the spoils. The vessels and cargoes were condemned and sold.

In those four years 1,500 ships were seized. Despite this, American merchants kept sending them out. The government protested. The French hid behind technicalities. They flaunted the broken treaty. Congress acted. It authorized the arming of American merchantmen, retaliation by the ships of the Navy. Then, in 1798, it repudiated the treaty it had not kept.

Owners did arm their ships. A typical result may be cited in the case of the ship *Rose*, out of Newburyport, Massachusetts. She sailed, March, 1799, under Captain William Chase, with a crew of 22 men. She carried a cargo of fish, hardware, gin, and dry goods worth $100,000. Likewise she had on deck eight carriage guns. At sea she encountered a French privateer of 14 guns and 125 men. A fight ensued in which the American gave a good account of herself, severely damaged the hull of the adversary, killed 25 men, and wounded as many more, while suffering a loss of but 2 dead and 15 wounded. The privateer finally boarded her, however, and, by force of numbers, overcame her, appropriated the ship and threw the crew into a French prison.

Case of the Rose of Newburyport

Many such engagements resulted, but the American merchantman was rarely of sufficient strength to defend itself against the privateer whose business was not commerce but spoliation. The merchantman which resisted, also, had no recourse to the courts. No merchantman which resisted is among the claimants of the present day. The French, under international law, did have the right to search for contraband. They had no right, however, to interfere with a peaceful journey like that of the ship *Amazon*, for instance, sailing from Baltimore to Spain, with a cargo of merchandise, which was captured and taken into Bordeaux.

Much more shocking was the encounter of the schooner *Nautilus*, in the territorial waters of the Dutch Island of Curaçoa, off the north coast of South America. She was armed and resisted a privateer that flew the skull and crossbones, but was forced to surrender. The captors came aboard, cutlasses in hand, killed the captain, his first and second mates and two seamen, seizing the ship and cargo. It was carried into the Dutch port but the officials there referred its agents to Guadeloupe, the French center of privateer activity.

United States Did Not Declare War

So bold were the French privateers that they lay off American coasts waiting for their prey. They even came into American waters. One of them had the audacity to sail up the Delaware River and seize an American ship almost at the docks of Philadelphia.

In the face of all these outrages the United States failed to declare war against France. Perhaps the consciousness of her broken treaty stayed such action. This seeming timidity, however, was not reflected on the part of the developing merchant marine. Ships were built faster than they were lost and the merchant marine grew steadily. This was the beginning of the era of America's greatest prowess at sea. It was but a little more than a decade later that the young nation went to war with Great Britain for outrages on her ships that in no way compared with those that had been perpetrated by the French.

In 1798 Congress authorized the President to instruct the commanders of public armed vessels to capture any French armed vessels they encountered. He was authorized to commission private armed vessels and give them the same authority. Yet even this was not

construed as war. No declaration of war was promulgated.

Here enters Commodore Truxton and the U. S. S. *Constellation*, most historic ship of her time. She had been but recently commissioned. Early in 1799 she was sent into the very stronghold of the French privateers, for a cruise in West Indian waters. Off Porto Rico, one February morning, she met, not a mere privateer, but the French warship *L'Insurgente*. Despite the fact that no recognized war existed between these two nations, these ships of their respective navies no sooner sighted each other than they began to clear for action.

Frenchmen Suffer Heavy Loss

The vessels were of about equal armament, but the Frenchman had 400 men as against 300 on the American. The record of the battle seems to indicate that the American outmaneuvered her adversary and that her guns were better served. She succeeded in passing her, back and forth, and raking her with a deadly fire. The Frenchman suffered a loss of 29 killed and 40 wounded while the American lost but two killed and three wounded. The Frenchman then surrendered to the American.

It was nearly a year later that the *Constellation*, again cruising in West Indian waters, encountered the French frigate *La Vengeance*, with 52 guns and 350 men, the American then carrying 50 guns and 310 men. The French vessel tried to take flight but the *Constellation*, having much speed, overhauled her. Truxton closed in, ordering his men not to fire until they were within pistol shot and to discharge their broadsides into the hull of the enemy. *La Vengeance* played a different game. She sought not to win but to escape. Her shells were so fired as to cut the rigging of her rival to pieces. The battle continued throughout the early tropical night and up to midnight. By that time every gun on the French vessel was silenced. She had been hit by 186 round shot and had 50 killed and 110 wounded. The *Constellation*, on the contrary, had but 4 killed and 25 wounded. Her rigging was so disabled, however, that the Frenchman was able to escape in the darkness.

This Was Not a Perfect War

And yet, despite all this fighting between ships of the rival navies, these baby republics never officially declared themselves at war. Years later a lawsuit, which questioned whether the period of French Spoliations was a war period, was carried to the Supreme Court.

The Supreme Court ruled that, while certain acts of war had been authorized by the government, this was not a "perfect war." It was, however, a "partial war." So, while it is customary to state that France and the United States have always been at peace, while histories are prone to belittle this early difference, there was active fighting for some four years.

During all the time that the spoliations had been going on there had been negotiations between the two countries. The United States had protested. France had maintained that there were reasons for the seizures, that she would make reparation where there was shown to be no justification. Many of the cases did actually come up in French courts and were decided in favor of the American shipowners.

Finally, in 1800, a settlement was reached between the two countries. Under the terms of that settlement France agreed to release the United States from her obligations under that baby treaty of 1778, and, in recompense, the United States agreed to assume responsibility for the claims that American citizens might have against France for unlawful seizure of vessels.

Having by treaty assumed this payment, the Government of the United States took no further action for 85 years. Then, in 1885 Congress passed an act authorizing its own Court of Claims to "examine and determine the validity and amount of all the claims . . . together with their present ownership."

Still the Years Drag on

This the court did. It passed on all claims that held in law and with relation to which proof could be established. Four appropriations were made between 1890 and 1905 for the payment of about $4,000,000 of these claims. There remains unpaid about $3,500,000. The Court of Claims long ago passed a unanimous finding on these claims. Congress waited 25 years and asked the same court, then presided over by new judges, to review the former findings. Again the court unanimously approved. But the years drag on and Congress fails to make the necessary appropriations.

Such is the record of the obligation that the government assumed, after many embarrassments, 125 years ago, which it has always admitted, but which it does not meet.

The Responsibility of Being Led

(*Concluded from page 20*)

action of the Legislative Committee; in the absence of such endorsement, the Legislative Committee has no authority under the Constitution of the Federation, to pledge 12,000 members in favor of any legislation, even with the approval of the Executive Board.

"This statement is made in the interests of fair play to the members of the Legislature, and of fair play to the 12,000 club women of N. H. who are entitled, through instructed representatives, to express their majority opinion, and thus to govern the activities of the Legislative Committee of the N. H. Federation of Women's Clubs."

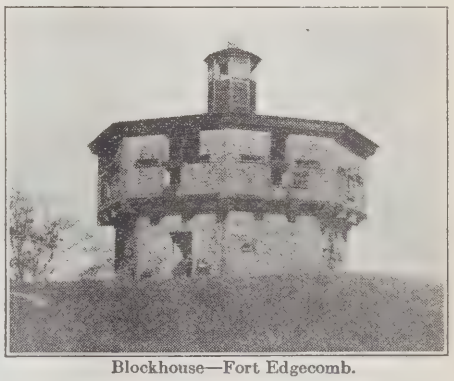
These women realize *the responsibility of being led;* they refuse to be led in what they believe to be the wrong direction, and, what makes them a real power, they hold those who assume to speak for them strictly to account for their leadership.

It is to the growth of this spirit among organized women that we must look for a check on the attempt by their radical leaders to undermine the principles on which our great Republic is founded.

Old Fort Edgecomb

FORT Edgecomb is one of eight old forts purchased from the United States Government by the State of Maine. The historical and sentimental value of their ruined blockhouses and grass-grown ramparts cannot be overestimated. Particularly is this true of old Fort Edgecomb on the Damariscotta River in southern Lincoln County, Maine.

Moses Davis deeded the site of the fort to the United States Government June 13, 1808. Here a fort was built for the protection of the Maine coast. Here were built extensive earthworks and a magazine of brick and stone. The Edgecomb blockhouse is a heavy, square-timbered structure of two stories with a basement. The first story, twenty-seven feet wide, is pierced for musketry, commanding all approaches. Octagonal in shape, it still stands, showing to visitors the methods of construction of that day'



Blockhouse—Fort Edgecomb.

the thickness of the walls, the wooden peg construction, the size of the hinges bolted to the massive doors, and the loopholes. The second story is thirty feet in width, twelve-foot posted and pierced with heavy portholes like the gun deck of a man-of-war, having an overhang of about two feet, the whole being surmounted with a wooden tower, outlook or watch-box, with an extensive view of the river, harbor and surrounding country.

Land of Enchantment

Algeria Grows in Interest With Succeeding Visits

By HAL WALKER

EACH time I return to Algiers as the entering port of Algeria the thrill returns. As the African continent rises out of the blue Mediterranean, one sees the high peaks of the Atlas, miles out at sea, and then the dazzling white of Algiers itself as the steamer slowly makes her way to anchorage behind the breakwater. The call of the unknown, of ancient civilizations too little known to most of us, is as strong in me as it was the day I saw Fujiyama on the horizon many years ago on the first trip to Japan.

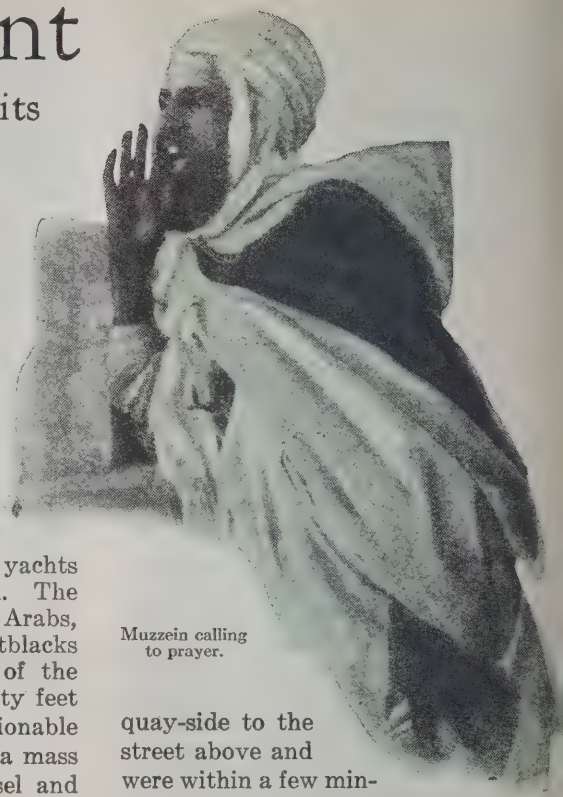
Japan, however, and the coast cities of China, could easily be termed provincial in comparison with Algiers. In Algiers there is a greater degree of picturesqueness both in the city itself and among its inhabitants than in any city of the Far East. The juxtaposition of an Arab and a French civilization in Algiers has no counterpart in any other city in the world, while in the hinterland this contrast is more marked than in any other section of the globe, not even omitting Damascus, that wonder city of Syria.

Three of us—a famous artist of Boston, an American art student of Paris, and I—stood at the rail of the steamer as Algiers for the first time unfolded before their eyes. They had come over from Marseilles for a week of painting something new, and I was there just to breathe again the never-to-be-forgotten aroma (stench the unimaginative call it) of the East. Somehow that smell of the East, impossible to describe adequately in words, once in the nostrils of the world wanderer, he is never quite satisfied until he smells it again and he will travel many a league and even undergo hardships to find it.

This smell was wafted to us on the deck of the liner as she made her way to dock through anchored vessels of many nationalities lying in the harbor and through scooting yachts out for a Sunday afternoon sail. The quays were lined with waiting Arabs, stevedores, hotel runners, bootblacks and newsies, while the railing of the Boulevard de la Republique, fifty feet above the bay and the fashionable promenade for all Algiers, held a mass of humanity watching the vessel and her passengers.

Customs examination in Algiers is a mere formality. Arab porters come aboard as soon at the gangplank is out, shoulder your baggage and take it to the customs shed where it is seldom opened, the guardians contenting themselves with asking if you carry any tobacco or alcohol. With an answer in the negative, a chalk mark is made on the baggage and you are free to go to your hotel, either downtown or on the heights of Mustapha Superior.

Taking a porter each, the three of us went to one of the elevators which save the walk of many steps from the quay-side to the street above and were within a few minutes installed in an up-to-date hotel. The notable difference in this hotel from those of the Continent and America is that its floors are all of cool tiles, spotlessly clean, instead of bare wood or carpets.



Muzzein calling to prayer.

Then out for a wandering walk down to the Place de Gouvernement where the East and West meet, and through it to Arab town along narrower streets lined with coffee shops where silent Arabs sit cross-legged on benches around the walls sipping their coffee from small cups, playing cards or listening to the music of native instruments. At the end of the wandering it is time for dinner and we hunt a native restaurant for cous-couss, the native dish, which resembles nothing so much as the famed Valenciana of the Spaniards but without much of its heat supplied by peppers, both red and green.

Next to Marseilles, Algiers is the busiest port under the French flag in number of vessels entering and clearing. It must be admitted, however, that much of this shipping calls merely for coal, as the port, sticking out as it does into the Mediterranean, is on almost a direct line from Gibraltar to Port Said and so gets the coaling of vessels bound to and from the Orient from Europe and the United States. The French in building Algiers combined the French architecture with the Moorish so that the modern city has a touch of the old as well. The Arab section of the city hundreds of years old, has not been changed since it was inhabited mostly by those pirates who terrorized the Mediterranean coasts and into whose activities the Unites States Navy looked with dispatch on one memorable occasion.

The Arab population of Algiers

Touggourt, the market place.

numbers 203,000 persons and is said to represent 40,000 tribes, most of whom trace their origin to the days long before the Christian Era. The Algiers of the Arabs is built, tier upon tier, of dazzling white houses on the western side of the bay and facing the east, Mecca, as do all Moslem cities. Bootblacks, regular "street Arabs" we call them at home, swarm in the downtown section of Algiers and importune customers, if not for a shine then for a brush.

The architectural and civic beauty of Algiers is greatly enhanced by the rich verdure of the mountains. This gives a beautiful background against which the dazzling white of the city, triangular in shape, gleams like a gem. Over all towers the Moorish citadel or kasbah, more than 400 feet above the sea.

As mentioned previously, Algiers is divided into two parts. The lower part, the modern city, has been built by the French and in no way differs from a well-appointed European city. It has wide, well-shaded streets, spacious squares with statues and parks, and five municipal buildings. The city is lighted by gas, and water is supplied by four aqueducts, built in the beginning of the seventeenth century.

In marked contrast to this modern Algiers is the old Moorish city, which remains in all essentials as it was in the reign of the Turkish deys. The streets are narrow and crooked and often impassable for vehicles. The whitewashed stone houses present bare walls to the street, but their interiors bear the marks of splendor and beauty characteristic of Moorish architecture. The flat roofs of these houses in the evenings become centers of gayety and are sometimes used for social functions.

The quaint charm and picturesqueness of this section is accentuated by the motley crowds found on its streets. Here elegantly dressed Frenchman, splendidly arrayed Moor and scantily clad native from the interior mingle in a great pageant.

The citadel or kasbah was begun in 1516, and it served as the palace of the deys until the French conquest. At present it is used as the French barracks and it has lost many of its historical features.

Whereas before the French occupation there were 100 mosques, only four are at present in use. In the modern city, however, there are several splendid churches.

Algiers is supposed to have been founded A. D. 944, and fell into the hands of the French, July 5, 1830.

Algiers itself, however, is only the gateway to Algeria, but it is all of the country the passing tourist sees when his steamer stays only a day in port. It is the hinterland which is so rich, from the mountain tribes to those of the desert, most appalling of which are the glass-eaters to be found in Biskra.

There is a general belief that the French are not successful as colonial administrators—that they govern too much for the sake of the native inhabitants and the glory of France, and not enough for the financial advantage of the mother country. Algeria proves the contrary to this hypothesis for, since the French troops landed at Sidi-Ferruch in 1830, a fertile country, which had, under Arab rule, or misrule, lapsed for centuries from cultivation into swamp and jungle has been reclaimed to cultivation, huge farms equipped, vineyards planted. Vast wheat fields are under cultivation and Algeria with each passing year is rapidly becoming the granary of Europe which place the country held in the days of Ancient Rome. The wheat crop of Algeria last year supplied the greater part of France's imports and kept her from buying abroad at ruinous rates of exchange.

Arab chivalry.

Railroads and motor roads have opened up the country—the motor roads are held to be as excellent as the famed roads which connected outlying parts with the centers of the Roman Empire. Some of the engineering feats of the French in the Atlas Mountains are nothing short of marvelous, and the roads are built to last. So good are these roads throughout Algeria that a motorist can travel almost anywhere without worry and amid scenes not to be duplicated in any part of the world.

Naturally the relics of ancient Roman civilization are the most interesting features of the country. There are many small towns along the coast of Roman origin. Tipsa, west of Algiers, was founded as a Roman colony in A. D. 40, then became a city which embraced Christianity in the fourth century. Nearby is Cherchell, formerly Julia Ceserea, and dozens of other small places of Roman origin.

It is eastward and then southward from Algiers that the most famous ruins of Roman cities are to be found, and all may be reached by motor. Of these Timgad is the most overpowering. Founded by Trajan as Thamugadi in A. D. 100, sacked by the Vandals in 439 and finally destroyed by the Berbers in the seventh century, Timgad, because of its wonderful monuments in ruined temples and buildings, is styled the African Pompeii.

Only a short distance from Timgad on the road to Batna is Lambeza built over an old Roman city which equaled Timgad in importance. This city was occupied by the Third Legion and traces of the Roman camp can be seen in the excavation work already done.

One of the most picturesque cities in all Algeria, and it must be remembered in visualizing this colony that it is as large as all France, having a length east and west of 620 miles and a depth north and south from the sea to the desert of 250 miles, is Constantine, the Cirta of old. Constantine is a natural fortress located at a bend of the River Rummel which borders it on three sides. During countless centuries the Rummel has hollowed for itself a gorge of great beauty, although it may not have the overpowering sense for the beholder as does the Grand Canyon in the United States.

The sides of this gorge around Constantine are nearly perpendicular and at the time of its conquest its inhabitants enjoyed saying that they, who could spit on the wings of crows in their flight, had no fear of any assault. According to tradition, the Bey of Constantine used to have thrown into the river from the top of the precipice such wives as he no longer desired. The unhappy victim was tied in a sack, placed on a plank extending over the ravine and a jerk of the plank, as a springboard, threw the body into the ravine where it struck 600 feet below.

The first view of the desert from the gorge of El Kantara has nothing to equal it in the world, according to travelers who have seen almost everything, and then beyond lies Biskra, the Pearl of the Desert, made famous by Robert Hichens in "The Garden of Allah."

Uncle Sam Moves to His Own Music

(*Continued from page 2*)

rected, and staged exclusively by Americans, it was attended by Americans from forty of the forty-eight states. I do not say this with any idea of boasting, but merely as the most recent example of the reception accorded an American opera, particularly when produced elsewhere than in New York.

"In my opinion, the Metropolitan Opera Company should produce at least one American opera every year. It is untrue to say that such operas cannot be obtained, and if the management of the Metropolitan could or would see the handwriting on the wall, it would begin such productions immediately and continue them. It must be remembered, however, in considering the development of an American national music, that time is required to produce a large musical work such as an opera, an operatic cantata, or the orchestration for a chorus. At least two years, and often three, are needed to produce the music and book of a three-act opera. I have been working for two years on 'The Witch of Salem,' another American opera, and with this, my other compositions and my concerts, though I spend long days at the piano, my full time has been occupied. I have found abundant themes for my music in pioneer, Indian, and Negro tales. Though these tales are largely evolved from the folklore of early Americans, red men and black men, I have not found it necessary to use their folk songs, or their folklore, except as a basis for the development of ideas. It is difficult to make this connection between the sources of musical themes and the music itself quite clear, but it is in this manner that American national music is being formed.

"What we are developing today is a composite American music, drawn from and acknowledging all American sources, yet blending the products of each of these sources so well that the result gives us intimations of all of them, but identifies no single one. When you hear certain music you say, 'That is French,' 'That is Italian,' 'That is German,' and so on through all the national schools of music. Up to now we never have been able to say truly that any music is American. Syncopation, jazz, certainly is not American music, though it has been touted as an American production by those aliens who created it, yet it has a place in American musical history, and parts of it are useful in the molding of American music.

"But we are moving away from such false standards and beginning to make a music—somewhat as the red man 'made medicine' to insure his good fortune in battle or the chase—which reflects the characteristics of American history and of America's development. Later will come, and already there are glimpses of it, the reflection of the industrial and commercial life of this country, for we are today pioneering in commerce and industry no less brilliantly, no less wonderfully, than we pioneered in New World history, settlement, agriculture, and transportation. Thus, industry and commerce, American in every phase, are equally fitting as the subjects for American music. Our American composers are surely awaking to this truth, just as they have waked to the sources of American music in American history."

Finale of "The Sunset Trail," one of Cadman's operas.

The composer leaned over to the keyboard and played a few bars from his "To a Comedian," a light composition which expresses life in Hollywood—"a phase of the lighter side of life," he said. This led him to the interesting expression that "it is not necessary to have national music to have good music. We can have in this great country local music within national music, sectional themes, worked out by composers familiar with them. Themes of the North, the South, the East, the West, just as in early England they had sectional ballads, topical songs from every part of the British Isles, all of which were truly British, yet which never were welded into what might be called a national music.

"If American composers and musicians strive consciously and consistently to express themselves, as Americans, they will express the spirit of the United States. Just as it is impossible to 'create' a music center or an art center, unless that center naturally grows by the coming together of musicians and artists minded to make it grow, so a national music must grow, it cannot be forced as one would force a strawberry or a watermelon in January in a hothouse. National music must be inspired music; American music must be the product of Americanism, of love for the United States, adherence to its ideas and ideals, and knowledge of its past, filled with confidence in its future. Composers, and, to some degree, librettists, must write as they feel, if their music is to endure, or if it is to express anything worthy of expression. An American music cannot be produced to order, like a piece of jazz or a 'penny-dreadful' story, written last night to be sold today, to be played or read today, and then lost forever.

"But, to revert to the condition of American opera: Operatic history in the United States is being changed entirely from what it has been since—let us say as a roughly accurate date—the Civil War. In five years more we shall have several first-class opera companies presenting American operas both in our larger cities and on the road. This year 'Al Gala,' by an Ohio composer, is being brought out with success. In Europe, opera companies do not expect more than five per cent of the operas produced to live. So we should not expect all American operas to be successful. Hundreds of operas are given in Milan, for example, yet less than five per cent of them are even moderately successful. But the foreigners who have been in control of American musical productions, when they rarely did produce an American work, immediately shouted, 'See, it is no good,' and, with this as an excuse, declared that the American people did not want American music, operatic or otherwise. Now all this is changing, and the American people have come to realize that, to find the good American operas, a large number of American operas must be produced, just as a large number of European works are produced each year, of which less than one in twenty ever is heard of again.

"We are coming to (*Concluded on page 28*)

Where Are Israel's Lost Tribes?

(*Concluded from page 15*)

rabbis are to be excepted from this fear. I mean not the Jewish lecturers or teachers or preachers merely but those entitled to conduct the services of the synagogue, a privilege confined strictly to the Levites. These are not allowed to engage in commercial business. They are really a tribe apart from the Jews.

Who Are the Jews?

"This pivotal question of Who are the Jews? was stressed recently during a remarkable speech in the House of Commons by Lieutenant Colonel Williams. He said, among other things:

"'My case rests upon this—that the Jews outside Palestine are not a Palestinian race . . . the boasted purity of the descent of the Jews is a myth . . . historically and generally, all the evidence goes to show that the Jews outside Palestine are not the descendants of people who ever came out of Palestine. Are the Jews a race exiled from Palestine? If they are not, I submit that the whole case for Zionism falls to the ground . . . Being convinced that the Jews are the descendants of proselytes, when you come to examine the position of Jews in the world you find that *nine-tenths* of them outside Palestine are in Russia and Central Europe. You naturally ask how they came there. Again history gives an indication. It is a known historical fact that there was a very large empire in Southern Russia, the Empire of Khazar, which was converted wholly to Judaism. The Emperor of the Khazar, the grandees, and the various large masses of the population were converted to Judaism. The Khazar Empire stretched through Bulgaria to the Caspian, from the Black Sea right up into Russia. I will give a small extract from a Jewish encyclopedia on this point: *"It was probably about that time that the Emperor of the Khazar and his grandees, together with a large number of his heathen people, embraced the Jewish religion."* '

"Returning to evidences of our descent from Israel in early Britain," resumed Mr. Goard, "it is interesting to note that King Alfred's Code, which for many years was known to all the people, began with the command: 'Ye shall not oppress the stranger nor the newcomer within thy gates.' And it is the ancient law of Israel that remains the basis of British and American Law and Jurisprudence, despite the efforts through centuries to displace it by the Roman Law. Christ abolished the *ceremonial* law and its animal sacrifices, but he confirmed the *national* law and declared that he came to fulfill it in every jot and tittle; every dotting of the *i* and every crossing of the *t*. The carrying into effect at this time of the famous law of the seventh year when all debts were forgiven would alone do much to restore normal conditions and prosperous trade in Europe and America. Students of the policy of the Puritan Commonwealth in New England will remember that their laws were founded on the laws of Moses. Indeed, on sailing for America the Puritans declared that they purposed 'extending the borders of Zion.'

"There is room on the planet for the rule and dominion of the Company of Nations called Israel, as foretold in the prophecies of the Bible. There is room for the rule and dominion of the Commonwealth of Nations called the British Empire and for the American Union. But there is not room enough for both Israel and Anglo-Saxondom, if these are two separate conceptions. It must be one or the other. Simple corroboration of the truth that the Anglo-Saxon-Celtic peoples are one with the Nation of Israel is furnished by laying a map of the domains of the Prophetical Israel over a map of the actual landed domain of the British Empire and the United States of America. It will be found that they are coterminous. In the light of modern Bible scholarship, of history and ethnology, there is no resisting the conviction that we of the British and American states constitute a nation created by God, as told in the fifteenth chapter of Exodus and were there given a constitution and laws which it is up to us to uphold and obey and carry into practice. Before that can be perfectly done we shall have to pass through a last great struggle; to stand at Armageddon and do battle for the Lord."

"Then you do not feel that the League of Nations or the International Court of Arbitration will be able to avert another big war?" I asked.

"The League of Nations is a gathering of idle talkers," answered Mr. Goard promptly. "Its whole character is divisive rather than unifying. There is no coherent principle uniting the fifty-five 'nations' comprising that body. It is held together by no common interest or understanding and it is bound to give birth to many misunderstandings. It reckons without its host in reckoning without God's Plan for his people. Besides, evidences of preparation for Armageddon multiply daily. The Red army controlled by the Jewish Junta at Moscow is the strongest army in the world today. Agents of the Soviet Executive are buying horses in Canada, Texas, and other parts of the world and they are buying and building airplanes. What is more, in view of the fact that the next war will undoubtedly be a bacterial war, that is, a war waged mainly by the dissemination of the bacteria of deadly diseases scattered among both combatants and noncombatants by means of explosive bombs dropped from airplanes, the Bolshevists are enlisting in their service a strong force of bacteriologists from the laboratories of Germany and Austria. I know personally of several leading men in universities in the United States and Canada who have been approached by these Moscow agents with tremendously tempting offers, so far as money is concerned. To their honor, be it said that these offers were turned down flatly.

Armageddon Already Under Way

"As to when the struggle will begin and its duration, one must be chary about venturing exact dates. In a sense, Armageddon is already under way, in-so-far as the ramifications of the International Plot outlined in the Protocols are concerned. Some of the best interpreters of biblical prophecy put the date of the visible beginning of Armageddon as near as 1928. They think it will probably last for seven years, unless the time is mercifully shortened. This hope rests largely on the extent to which Britain and America rally to the banner of the Lord during the next year or so. There are now about one million persons throughout the world who are adherents to the British-Israel cause. The International Banking Ring and its power is solidly organized and steadily, as well as stealthily, active on the other side. But right is on our side and right makes might!"

The Shearers and the Shorn

Talleyrand's philosophy is said to have been summed up as follows: Society is divided into two classes—the shearers and the shorn. Wise men join the former and avoid being caught with the latter."

Senator Shipstead, of Minnesota, in a comprehensive article which appears in THE DEARBORN INDEPENDENT next week, tells how such shearing is done in the field of commerce.

The principal shearing places are the Chicago wheat pit and the New York Stock Exchange.

The fleecing of the "lambs" by the bulls and the bears has become a reproach to the nation, and may become a national disgrace.

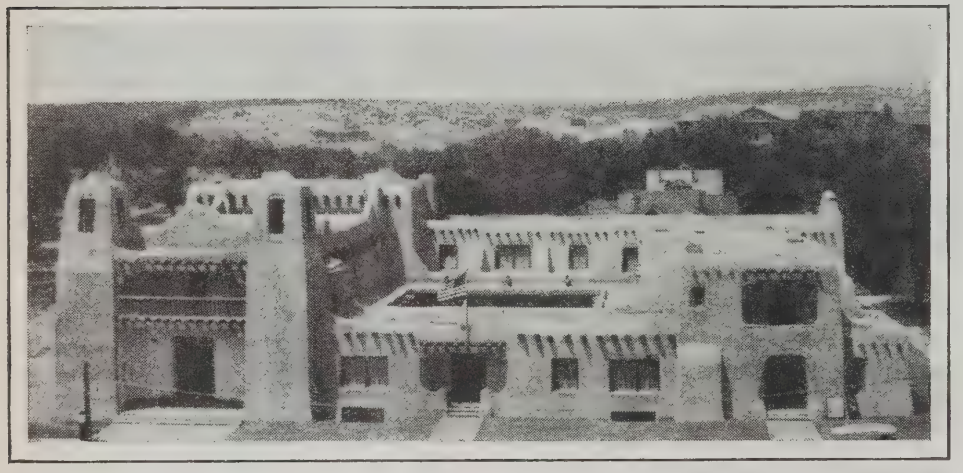
The True "American" Architecture

NEW MEXICO is called a land of mud houses. It is. This is one of them, called "The Temple of St. Francis and the Martyrs," and considered the gem of the Santa Fe-Pueblo type of architecture. It is also the State Museum's most recent addition, housing, especially, the finest paintings of the world-famous Taos and Santa Fe artists' colonies.

I have called this the true "American" architecture. This is why: Of all architectural styles and types developed in America this is the only one not based upon some European or Asiatic model. The origin of this style is to be found in the terraced pueblos of the Indians and their prehistoric ancestors, the cliff dwellers. Its development has been through the Franciscan missions built by the Pueblo Indians at the instruction of the early Spanish Friars. This specimen has for its façades replicas of various old missions, those showing prominently being replicas of San Felipe and of Acoma.

The materials are native clay with hewn beams, unpainted, and hand-carved portals and corbels. The beauty of this type of building lies especially in its fluent, graceful lines and in its absence of exact balance and sharp corners. It is also fascinating to watch the changing play of lights and shadows on its beams and abutments. There is a patio or inner court, and the left wing is the auditorium of the School of American Research. It is an exact replica of an ancient Franciscan mission church room.

There are dozens of residences, business houses, curio shops, garages, and so on, in Santa Fe built in this style. Even the city's best hotel and the Federal post office building are both Santa Fe-Pueblo—or, to be exact, true "American" in their architectural construction.



Uncle Sam Moves to His Own Music

(*Concluded from page 26*)

realize, too, that a musical work, whether it be merely a song, or an entire operatic score, cannot be done on paper. It must be produced, it must be given a hearing, presented by competent, well-selected singers, surrounded by the best and most appropriate methods of production. These things are being demanded for American musical works, and, as they are obtained, American musical works are proving the equals of any produced anywhere in the world. The Chicago Opera Company is taking the lead in presenting both American works and American artists. At least 60 per cent of this company is American, as compared with 10 per cent in the Metropolitan Opera Company, controlled as it is by foreigners. The Chicago Opera Company gives three American conductors an opportunity every year. Frankly, I expect the Chicago Opera Company to put over the first really big American operatic success within the next few years.

"America today is not the product of the fusing of foreign ideals, nationalities, religions, politics, or other alien factors; it is the survival of early Americanism despite these foreign influences. If we are to develop to its fullest extent an American national music, we must apply to it the original dauntless, indestructible spirit of America, voiced through the compositions of men and women thoroughly imbued with that spirit, and uninfluenced by the themes or methods of other countries. We must make our music as American as the Stars and Stripes, as true as the Declaration of Independence, and as enduring as the Constitution. We have sources for such music as profound and as thrilling as those of any other land; we have the composers capable of translating our history and our national development into music, and we are beginning to obtain presentation of the productions of these artists—a school of music constructed on American foundations, for the American people."

The Record of a May Day

(*Concluded from page 13*)

Nature. Tragedy! again it comes in sight, and now for a certainty I see its personification humped up against the huge roots of a red oak tree with rifle cocked, and eyes firmly fixed on the top of a branching white oak tree, one hundred yards away. I move on toward this human being who has his eyes fixed on the nest of a red-shouldered hawk. The mother comes to her nest, while the man with the gun doubts. He fears the young are still in the eggs and he dislikes to waste ammunition. He wishes one shot to kill the mother and young!

I asked him why. The hawk carried away a fowl or two each year from his barnyard. "They are vicious birds," he muttered. "All of 'em deserve death."

"How many fowls do you kill each season?" I ventured to inquire.

"Oh, a hundred or so, I guess."

"Who is seeking your scalp for such tragedies?" I asked half-smiling, hoping to bring him into a sympathetic relation with the mother hawk. He dropped his head, let the hammer down on the gun and said:

"The birds themselves might do it, if they could understand, but you know that man is a superior being and master of all he sees."

I was standing near the banks of the Chickamauga, a stream that looked so peaceful this May day that if I did not know history, I would not suspect that thousands of Indians had met death on its banks, and who became so enraged at the United States Government in its younger days that they made a number of formal declarations of war against it. If I did not have the printed historical facts I could not learn from this placid stream this May day that along its sides the Blue and the Gray had once been mowed down by musket and cannon.

"You see," he went on, "I might kill more fowls each year but this creek furnishes me a number of fish in the course of a year."

The man moved on toward his home, leaving the mother hawk and her young unharmed.

It was time for me to return to the city.

The sun was bidding farewell to the day, and in the gathering twilight the creatures of fur and feather were retiring to their resting places.

Can You Think on Your Feet?

(*Concluded from page 17*)

stantly, occasionally getting mixed. She told a number of stories that were very old.

It is but fair to state, that during the past few years English lecturers on tours in this country have vastly improved in their oratory. Hugh Walpole and John Drinkwater are among the best. John Swinnerton I did not care for so much.

The effect of oratory is very much overestimated, but there have been, of course, historical occasions where it has been very great—for instance, some of Webster's great speeches on the Constitution. Patrick Henry's speech in which occurred the words, "Give me Liberty or give me death!" did not have the effect attributed to them in the schoolbooks. Lincoln's Gettysburg Address fell flat at the time; not until later was it estimated rightly as being one of the world's greatest oratorical masterpieces.

When LaFollette Was Undone

A speech that undoubtedly caused the undoing of a presidential candidate was that delivered by Robert LaFollette at a meeting of the Publishers Association at the Bellevue-Stratford Hotel, Philadelphia, on the evening of February 2, 1912. I was present at that affair. Mr. LaFollette had made a long journey to get there, and his daughter was quite ill. His speech, as I recall it, lasted two hours and twenty minutes. He read from manuscript, and appeared to read the same thing over and over again. He did not confine himself to the manuscript. His audience consisted of a body of the most intelligent men in the country. He had been preceded by distinguished speakers, one of them Woodrow Wilson. One by one the listeners departed, until when he finished there was only a remnant of the former audience. This was one of the few instances in my recollection where a man's fortunes were altered by his public utterance.

Have Something to Say and Say It

The most potent kind of oratory is that which comes under the head of *the appeal to common sense*. Representatives of this oratory who stand out in my recollection are Charles W. Eliot, of Harvard, and General Leonard Wood. President Eliot talked in the simplest manner, his words carrying conviction. General Wood was homelier in his expressions and told stories to illustrate his points. This so-called common-sense method is, of course, the highest kind of oratory, which at bottom can be expressed by the formula, *Have something to say and then say it.* Neither of these speakers had the kind of humor which is so effective in some forms of oratory, and which at the same time is so difficult to describe. William Jennings Bryan has humor of this sort; it is not the humor of men like Mark Twain and Simeon Ford; it is done in apt phrases applied to a particular situation. It is really stage business, in that it consists in visualizing some object in the minds of the audience. This is precisely what Bryan did in his famous speech in Chicago where he brought in the Cross of Gold. Bryan thus uses the commonest objects or at least those objects which are familiar and is thus able to get over his idea. This method is the foundation of humorous oratory, only in the latter the speaker proceeds to give a string of visualizations, the listener being convulsed by the contrast between objects. For instance, Simeon Ford's talk, "At a Turkish Bath," contains these phrases:

"I flung myself with an affectation of easy grace upon a marble divan, but immediately arose therefrom with a vivid blush and a large blister. I then sat upon a seething chair until I came to a boil, when I rose up and endeavored to alleviate my sufferings by restlessly pacing the room. A few towels were scattered about, and as the nimble chamois leaps from crag to crag, so I leaped from towel to towel in my efforts to keep my feet off the red-hot floor." Elsewhere he mentions the fact in referring to a brush and comb, that the comb was chained to the wall but the brush was allowed to roam at will.

Stephen Leacock Really a Great Humorist

Almost all of the humorous speakers use their own personalities as a kind of foil, but for a beginner this is very dangerous; a man must first have a personality.

Stephen Leacock, who is really a great humorist, is also a most effective humorous speaker, but is very uneven. I once heard him deliver a humorous speech on whiskers, which he dilated upon, ringing the changes, so to speak, on them at great length.

I thought his talk very dull, but afterward when I reflected upon it, the humor of it grew. It is not always possible to judge the effect of a humorous talk on an audience. I have been frequently conscious of great failure, only, years later, to have something I said referred to as having been remembered from that particular evening. I once had an engagement to lecture at a remote university, it being understood beforehand that I was to select my own subject. I did not arrive until just before the lecture. The president of the university greeted me by remarking that he had just got up out of a sick bed and was going right back after I got through. We compared fatal diseases for a few moments before the lecture began. He then advanced to the front of the platform, and said in a sepulchral voice:

"Our lecturers are chosen more for their reputations as men than for their speaking ability. I have been talking with the speaker of the evening, and although I see by this"—he thereupon waved a newspaper clipping in his hand—"he is the author of some thousands of jokes, he impresses me as being very serious. I cannot believe that all of these jokes are good, but maybe some of them are." It was a very melancholy affair, and I was glad to sneak away later, secretly hoping in my wicked heart that that tactful gentleman would crawl back into bed and stick there until the undertaker came.

The Man With the Flowing Whiskers

If you live in any kind of a home town that you can call your own, you are likely to be called upon at any time to preside at some banquet. This requires a special sort of ability. It consists essentially of knowing just when to stop. I recall once living in a certain town to which there came a magnificent man with flowing side whiskers, who had a wonderful flow of language and who was immediately asked to preside at all the functions that took place. He was a perfect toastmaster; his voice, loud and resonant, completely filling all the spaces. Everything he said about everyone was exactly right. Yet, after he had been with us a year, he became a kind of village pest. He did it all too well. This recalls an occasion where I presided at a dinner given to Woodrow Wilson. I made a terrible introductory speech, stammered out a few words and sat down, greatly discomfited. A year later a man called on me and asked me to preside at another meeting in the vicinity.

"No, thank you," I answered, still shuddering. I then told him my experience at the Wilson meeting. "Yes," he replied, "I was there and liked what you did. You were so brief."

C. Dana Gibson as a Speaker

The best presiding officer I know in this country is Charles Dana Gibson, whom I have known for so many years that I cannot now recall when our friendship began. When Gibson first began he was very diffident, but in the course of a year or so he got all over this, and it was always a delight for anyone privileged to hear him. He was, during the war, at the head of the artists' committee, and he kept these gentlemen full of enthusiasm for their poster work. Gibson is a natural *raconteur*. He never resorts to recalled stories—in fact, as often as I have heard him, I never knew him

to tell one—but relies always upon his own inimitable sense of humor. He has charm, a kind of boyish intimacy which immediately puts everyone at his ease. At a dinner where he presides, he is never at loss. In the beginning—where there are a number of speakers to come—he will intimate beforehand not only who the speakers are but what is in store, thus awakening the curiosity of the audience so that when the speaker is finally announced the way has been prepared for him. This is very nice psychology, for what the audience expects makes a great difference. To show my meaning, an incident was told to me by W. A. Rogers, the cartoonist. During the latter part of the war he was asked to speak to some returned soldier boys. He was somewhat nervous about his ability to make an effective talk, until it was suggested that he meet the boys first individually. He did this, becoming personally acquainted with each one. When he got up to make his talk, the fact that he knew them all and they knew him made it quite easy.

When M. P. Wilder Visited Our Town

No matter what the speech is, definite preparation must precede it, and this preparation must be complete, that is to say, no detail is too trivial to overlook.

I recall quite vividly the visit years ago of Marshall P. Wilder to our town. Wilder was a very amusing hunchback. He had a bright face, a keen sense of humor of a sort, and he was fairly well educated. He came to the church, and the committee that engaged him was particularly anxious that he should say nothing which would be considered either indelicate or irreverent, as this was in those days when there were indelicacies. Wilder promised to comply. His talk was divided into two sections. During the first section he told things which were highly dignified and remote. At the conclusion the chairman of the committee was plainly worried.

"This thing doesn't seem to be going just right," he said to Wilder.

Wilder suggested that they would better let him loose. The second section was a riot. He made a great reputation as a humorous talker, and the fact that he was a hunchback distinctly helped him. Lincoln was at first very awkward, and when during his campaign for the presidency he came on to New York to talk he wore a new suit and was obviously ill at ease. But it was what he said that counted.

It is generally agreed among successful speakers that stage fright is always a good sign; it almost invariably precedes effective speaking, where speakers have had any ordinary experience. Where men speak constantly day after day and say the same things, as in a campaign, naturally stage fright disappears. What it really means is a sense of inferiority which attacks a speaker and puts him on the low level. It is from this low level that he comes up when he begins to speak and this gives him a gathering confidence.

The best authorities agree on the whole, that memorizing a speech beforehand is not only unnecessary, but may easily be a handicap. But the subject must be thoroughly thought out, every word visualized, and whole phrases memorized, even if they are not used in the heat of speaking. The best method seems to be to write out beforehand, at great length, all that is in the speaker's mind on the subject. After this is done, it should then be read over and over, and, if necessary, rewritten. This process completed, the manuscript should be thrown away and the main points of the discourse thoroughly fixed in the mind.

The most experienced speakers then generally make a skeleton of the entire speech, by the use of key words. If the subject has been thoroughly thought out beforehand, key words are all that are necessary to recall the thread. Lord Stanhope, who was one of England's greatest orators, gave as instances "his only written preparation for two of his most remarkable harangues." He had undoubtedly, however, thoroughly committed to memory what he wanted to say. He made a speech in 1803 on the renewal of the war, and his notes consisted of a series of key words like Elba, Etruria, Louisiana, Black Sea, Piedmont, Switzerland, cases which may arise, Portugal, press, system of Foreign connection, and so on.

This was the speech of which Fox said that, "If Demosthenes had been present he must have admired and might have envied."

Two Things Are Necessary

To become a first-class speaker it is, of course, necessary not only to know a great deal, but to have a well-assorted vocabulary, and in addition to have special talent which in itself is quite indefinable. But any person of ordinary education and intelligence, no matter how poorly he thinks of his own personality, can become a good enough speaker for practical purposes if he is willing to give up his time. Allowing for the necessary practice, only two things are absolutely necessary. The first is the voice, which must carry, and the second is the ability to think on one's feet. When I first began speaking my voice was very poor and I despaired of making it any better. A friend of mine who was a good public speaker told me to speak to the last row in the hall, and usually to select some man in it and talk to him. I found this was a great help, but my voice was weak and the effort to keep it up to a proper pitch was too much for me, so that I failed completely. I then began practicing by myself by reading aloud and going off in the woods and talking to the trees. Eventually I took voice lessons which I found were an enormous help. It must be remembered that it is the ability to throw the voice, and the right pitch, that count much more than the volume. But, unless a man or woman has a natural speaking voice, some voice training will be found necessary.

The Genesis of Good Oratory

As for thinking on one's feet, that is all contained in the preparation. I defy anyone to think out any subject thoroughly and not be able to talk about it. But still, there is a little trick that one learns in thinking on one's feet which I have found very valuable, and that is the ability to keep one thought ahead. I can illustrate this best by common rule in driving an automobile. In traffic, we not only look at the car immediately ahead of us, but the car ahead of that one. Our own movements in managing our own car are automatic, but by preserving this rule of looking ahead two cars, we can control our car and keep out of accidents. It is much like this in speaking The thought you are now holding and speaking, and which the audience is getting even as you speak it, is under complete control. But if, at this instant, you have a kind of double sense, and are looking ahead and know what the next two thoughts are—why this is all that thinking on one's feet means.

It seems difficult, but it is very easy when one has learned the trick. You will find that in ordinary talk, where, perfectly at ease, you are driving home some thought to a friend, you do this automatically. As soon as you acquire the habit of doing it before an audience, your control over yourself has begun. After that, your progress and development as an orator will depend on your general mental equipment.

Trouble at Washington

(*Concluded from page 21*)

developed in spite of and not because of the influence of the three advisers. The Secretary of the Treasury has shown no itch to become a political organizer. He has confined himself pretty sharply to the absorbing financial problems that go with his job. While this automatically takes him out of the Hoover-Butler class he nevertheless adds to the sum total of the pro-monopoly and purely materialistic influences about the President. He himself is the principal owner of one of the tightest and most far-reaching monopolies in existence. No argument will be needed to show that Mr. Coolidge will have to run counter to the wishes and advice of this powerful trio if he proposes to extend any olive branches to those liberals who hold that there is such a thing as *Bad* Business which needs watching and regulating.

Home, Sweet Home

(*Concluded from page 5*)

for some of us to keep in the straight and narrow path of simplicity. Many small homes are restless and worried looking because we endeavor to incorporate in one small structure all the little details and fancies we admire. We see roofs like Jacob's coat of many colors, and laid to resemble nothing so much as ocean waves. We see houses built of brick, half-timber, stucco, siding and shingles, all skillfully blended into one dazzling combination of materials and color that certainly must cause the Puritan fathers to roll over on their faces. But even these weird creations help in educating our taste—in showing us what to avoid. We are learning that even in a shingled roof ostentation may lead us away from the harmony, rest and repose we should earnestly strive to build into our homes.

There are no "latest spring styles" in domestic architecture. That which is built without undue ostentation, without "stunts," and with a thoughtful and judicious use of materials and a measure of common sense and good taste, will always be pleasant to the eye and will be easy for both our neighbors and ourselves to live with for all our days.

Mrs. John D. Sherman, president of the General Federation of Women's Clubs, says: "Ownership of homes should be preached enthusiastically over the whole country in the interests of better children and better America." And we would add that any one who builds a home has the greatest opportunity for the expression of all that is best and most worth preserving in our present civilization. Indeed, the building of a home is the greatest romance and the greatest adventure we may enjoy. It stimulates the best that is in us into expression. No matter how clever an architect we may employ, the principal obligation lies in our own hands, because an architect only gives expression in a concrete and material way, to that which exists in the spirit of the people.

When we find a great public interest in religious or spiritual affairs, then we find architects and builders building great cathedrals; when we find industry operating on a high standard of service, we find a glorified industrial architecture; and so, when we see, as we do today, a great nation making heroic strides toward "Home, Sweet Home," we find the architects and builders responding with the finest homes and more of them than the world has ever seen before.

"I Read *in the* Papers"

I read in the papers that in Los Angeles the spring crop of Boobs and Lollops is bigger than ever. Messrs. Hibbs and Hennessey—Harry and Tom, as they are called by their affectionate victims —having talked of

(1) a $100,000,000 deal for control of the Bank of Italy

(2) the construction of a $50,000,000 corn products factory at San Diego

(3) a $6,000,000,000 rail merger

had to form 'em into a line, they came on so thick and fast. The earnest and industrious pair had taken in a scant $300,000 from motion picture directors and employes, county clerics and what are laughingly called business men, when the authorities stepped in and spoiled the fun. It is now discovered they had already taken in $1,000,000 in Cleveland. They are held for $150,000 bail, but the contributors to the fund are still at large. The summer, judging by the spring, promises to be the biggest yet. Already those left out of the deal are phoning for reservations on the next. Do your summer lolloping in Los Angeles.

I read in the papers that the State of Maryland, a political unit that is not so big as some western counties, has been persecuting hundreds of homeward bound northbound automobile tourists from Florida. Scores of bewildered people slept in their cars while endeavoring to satisfy the vindicators of the dignity of the State of Maryland. Fines had to be paid and Maryland tags bought or the travelers had to wait until tags could be received from home states. It is this sort of thing that is keeping Europe in a state of hatred and poverty. Hordes of customs authorities and boundary guards who should be at productive labor are harrying honest people who merely want to make legitimate journeys across frontiers. Both the Maryland and European politicians can find volumes of laws to justify their antics; but common sense is lacking.

I read in the papers that the non-reigning Manchu Emperor, learning that plans for his extinction were on foot, fled from Pekin to Tientsin in a singular manner for the Son of Heaven. Attired in a brown tweed suit, and entirely alone, he boarded the night train and sat wedged between two common soldiers who would have instantly arrested their traveling companion had they known his identity. The Emperor described himself on the train as a student at the American Boxer Indemnity College. It was his first railway journey. Louis Phillipe started in this inglorious style of quitting the royal job. He clapped a derby hat on the anointed head, climbed in an ordinary cab and told the driver to take "Mr. Smith" to the station.

I read in the papers that the Channel Islands, Jersey and Guernsey, the homes of the famous dairy cattle, have agreed to consider the request that the islands make a contribution to the general government of England. At present the happy islands only pay local government expenses and escape the frightful income taxes of the rest of England. An English citizen can avoid income taxes by taking up residence in one of these islands. If Nantucket and Catalina islands enjoyed the same freedom from Federal income taxation as Jersey and Guernsey there would not be standing room for the prosperous colonists from the mainland.

I read in the papers that the Boston & Albany Railway has just put into service fifty steel coaches that carry one hundred passengers and weigh but one thousand pounds for each passenger. Standard steel cars weigh from fifty to one hundred per cent more per passenger. Several years ago all of the old school railway executives were making faces at anyone who dared to suggest that cars were too heavy and that the engines were hauling more junk than necessary weight. Under the pressure of economic necessity the same carping executives are now doing what they sought to discredit others for proposing.

I read in the papers that Count Herman Keyserling conducts his school of philosophy after the manner of the old philosophers of Athens. The Count's first books, translated for the American market, come a pair in a box, priced at ten dollars. Surely this is asking a bit too much of barbarians, however high their respect for knowledge, intelligence, wisdom.

While the iron is hot—a good many books, by no means of the enduring type, either in contents or binding, are put on the market in America at two dollars and a half. That is too much. Often these books are by our own writers, and often these writers are comparatively unknown. The publishers are anxious to get a wide reading for these books, supposedly. Yet they cannot see their way clear to marketing them at, say, a dollar and a half—which is, one would wager, a reasonable price. Who would become acquainted with America's literary trend must pay high toll.

A Sojourn With the Butterflies

Picturing a World of Vapery Draperies and Rainbow Colorings

By E. R. GAMMAGE

WEARY and listless with the cares and grind of the dirty, noisy city, I sauntered forth to lose myself.

Out into the fields I turned, not knowing or caring much where my wandering might lead, when, lo, something tiny and beautiful brushed me on the shoulder and darted yonder. Was it a challenge, I pondered? If so, then I would rally to its call and join in its onward flight. But make haste, or I would lose the glorious prospects that were mine to unfold!

Before me in rich profusion, scattered ever and anon, were God's own colorings! Flowers with velvety petals and deep, intoxicating odors! Springing up in bare and hidden places, yet gracing earth with their unfeigned gayety. Winking and nodding, smiling and laughing, they tumbled one over the other in earnest competition to reflect the most joy. O celestial bliss that earthly woes can ne'er reveal!

And this was to be my Palestine, and I the honored guest!

But behold, my hostess! Oh, the dreamy, filmy creature! And her friends gathered here and there and everywhere to give to me a gala day! Such costumes! Such vapory draperies! Such rainbow colorings! And the spidery lacings of their bodices! And how they disported themselves with that graciousness of the rising sun! And the lightning of their movements! And the ever-present consciousness—the life of Life! Their life! Dwelling here so beautiful among the beautiful!

One by one, was I bidden their acquaintance.

First, there was my hostess!

"Papilio Zolicaon"—America's largest butterfly!

Then quickly followed many of Papilio's most intimate friends. As I recall their various names they were surely very different from those of my friends back home.

"Danais Strigosa" (upper) and Danais Plexippus (lower) were the next to be introduced. They were regular riots of color! In fact, the most gorgeously colored of all American butterflies!

"Melitaea Charcedon" (upper two) and "Melitaea Sierra" (lower two) were also richly colored, but of a smaller variety.

"Argynnis Callippe," also elegantly adorned with colors and another small species of butterfly.

"Neophasia Menapia" (lower two) and "Neophasia Telooi" (upper two) were lovely, distinctive looking creatures who live in Arizona and were very difficult of acquaintance because of their unusualness and rareness. The male is pure white with black markings, while the female is brick-red and orange with black markings. They are given here more for comparison, and for the benefit of those who have never known this beautiful insect.

"Callidryas Eubule" is a symbol of wondrous purity in her immaculate whiteness.

"Pieris Sisymbri" (upper two) and "Pieris Protodice" (lower two) were another rare and select variety of my beautiful butterfly friends.

"Anthocharis Cethura" (upper two) and "Anthocharis Deserti" (lower two) were very petite and dainty little creatures.

"Terias Nicippe" was an adorable little male with his queen-wife.

"Colias Eurytheme"—a native child of California!

After roaming about in this dainty exquisiteness I was awarded the supreme honor of being permitted to carry home with me a lovely picture of each of my butterfly friends. But because they are such wonders of color, it was very difficult to get a setting in black and white which would do them justice; however, this was accomplished by using ray filters, which enabled me to obtain remarkable photographs. These have all been carefully numbered and named for your convenience.

During my conversation with them, they often referred to their closely allied cousin, the "moth." In fact, so closely are they related that they should be considered of the same family.

If one were so fortunate as to claim an intimate association with them, as I have had, he will find that the fine dust that clings to his fingers after handling them, when examined under the microscope, consists of minute scales. This is the sort of scales with which the wings are covered, and this coincidence gives them the name of the "scaly-winged" Lepidoptera.

As dusk lazily descended and the moths began preparing their toilet for their evening's gay festivities, I learned that it is very unjust to suppose that the moths are all plain and somber in color, while only the butterflies are brilliant. I found, quite to the contrary, that many moths are lavishly adorned with color, and are, also, some of the largest of the order. The moth flies mostly at night, of course, and has antennae of various forms. Their wings are seldom elevated when in repose.

Butterflies, or "day flies"—as they are sometimes called because of their preference for natural light—have antennae knobbed at the ends and they fold their wings vertically over their backs when at rest.

If one could become sufficiently heartless to kill these beautiful creatures they would make an attractive cabinet. A collection could be started with very little trouble. The requirements are a net spread over a hoop attached to a cane or pole, killing fluid, such as chloroform or benzine, a board for spreading the wings until they are dried, and a tight-covered box in which the specimens may be permanently kept.

As is well known, the ancestors of these lovely things are the caterpillar and various other larvae forms. The eggs are laid by full-grown insects, but from them is hatched worm-like larvae instead of insects. After feeding and moulting, the larvae, in turn, form cocoons or cases about themselves, from which they emerge as butterflies or moths, as the case may be.

And now in the afterglow of that unique friendship, again and again the vision returns flooding out all thought but that strange analogy—the *ugly, loathsome worm* transformed into such triumphant splendor! Was ever victory so resplendent?

Then piercing and unalterable down the ages comes that positive challenge:

Gen. 1:26. And God said, Let us make man in our image, after our likeness: and let them have dominion over the fish of the sea, and over the fowl of the air, and over the cattle, and over all the earth, and over every creeping thing that creepeth upon the earth.

Oh, *when*, I implore, will frail mortal burst asunder his earthly chains and step forth crowned with that glorious inheritance?

Left—Upper two species, *Neophasia telooi;* lower, *Neophasia menapia. Neophasia telooi* comes from Arizona. The male is pure white with black markings, the females brick-red and orange with black markings. Right—Upper, *Danais strigosa;* lower, *Danais plexippus.* Center, left—Upper two, *Melitaea charcedon;* lower, *Melitaea sierra.* Circle—*Papilio zolicaon.* Center, right—*Argynnis callippe.* Oval, left—*Callidryas eubule.* Center—Upper two, *Pieris sisymbri;* lower, *Pieris protodice.* Oval, right—*Colias eurytheme.*

THE LIBRARY OF THE
UNIV. OF ILLINOIS
URBANA ILL

NATIONAL SERVICE is not restricted to men in office. Much of the valuable service rendered the nation, aside from purely executive decision, has been rendered by men out of office. There is a sense in which a man out of office is freer to get at the truth than the man in office. If anything is being "put over" on the American people it is being done under cover of darkness, and the darkness is nothing but lack of knowledge, which is lack of Facts. The only light needed to drive conspirators against the people into oblivion is the light of Facts. Merely to have a thing *known*, to have the method *exposed*, to have the *Fact itself exploited*, is to accomplish what courts and investigations and threats could hardly do. The exploiters of the people fear the Facts. Facts would put the public in control of the situation. The main shortage is a shortage, not so much of necessities, but of Facts.

HIS FIGHTING DAYS ARE O'ER, BUT MEMORIES REMAIN.

CHRONICLER OF THE NEGLECTED TRUTH

BRIEFLY TOLD

In a closed room or near the ground the speed of ball lightning averages about two yards a second.

The Southern States imported only 13 pounds of butter in 1924.

Hen feathers were grown on a rooster fed a diet containing thyroid extract by the genetics department of the University of Wisconsin.

There are between 100,000 and 125,000 habitual vagrants in the United States who are able to work but refuse to do so.

The oldest Chinese newspaper was printed on yellow silk.

Early English newspapers were most frequently named Mercury with some qualifying appelation.

In Chinese waters, junks or boats are parked in double rows with an alley of water between them in much the same way we park cars in America.

Many wild ducks die of lead poisoning from swallowing shots of lead dug up from the bottom of lakes and streams.

Fish fed on raw meat, after the fiftieth day of their existence, gain considerably faster than fish fed on cooked meat.

The umbrella was known in China as early as 1100 B. C.

The first recorded idea of the typewriter is set forth in an English patent of 1714.

A mission church in Broken Hill, Rhodesia, is plastered with red clay from the abandoned homes of white ants.

Dentistry was known to the ancients of British Honduras where a skeleton was found showing five upper teeth inlaid with circular fillings of iron pyrites.

A new glass of organic origin, which is said to permit the passage of ultra-violet rays, has been perfected by two Austrian scientists.

There are at least twenty-three government bureaus and commissions in Washington which do not come under the head of the ten regular departments.

The oldest Norwegian singing association in America is the Normanna Sangerkor, founded on June 1, 1869, at La Crosse, Wisconsin.

Cha-ma-lung-mo, meaning "the place where it is so high that even a bird goes blind when he gets there," is the Tibetan name for Mt. Everest, the highest mountain in the world.

Animal products furnish 40 per cent of the human food consumed in the United States.

The population of Europe, during the past 125 years, has increased from 200 million to more than 450 million.

The white race possesses 70 per cent of the cultivated land of the world, although it comprises only 40 per cent of the world's population.

Twenty years ago it took nearly ten yards of gingham to make a woman a dress, whereas she now manages to be thoroughly in fashion on three and one-half yards.

The northernmost point of wheat production in North America is found at Fort Yukon (latitude 66° 20′), Alaska.

Bee stings have been recommended as a control in cases of doubtful death because bee stings determine a skin reaction upon living people.

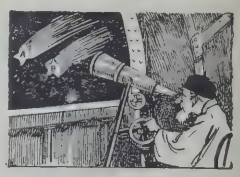
Each step taken at a 28,000-foot level on mountains is equal to the exertion required for a 100-yard dash at sea level.

An area, 100 by 250 miles, in Texas, supports 400,000,000 prairie dogs that eat enough to maintain 1,500,000 head of cattle.

In the making of an ordinary shoe today, there are 174 machine operations, performed upon 154 different machines, and 36 hand operations, altogether 210 processes.

Originally the word Buccaneer meant one who dried and smoked meat on a "boucan." A boucan was a hurdle made of sticks on which strips of beef newly salted were smoked in the West Indies by whites who were, for the most part, pirates.

Comet seekers of the skies have discovered two new comets which they have named 1925a and 1925b.



Both Whistler, the American etcher and artist, and Poe the poet, were dropped from the military academy at West Point.

Two native baseball teams at Buenos Aires have been organized.

Salt placed on snow forms a salt solution with a lower freezing point than snow, causing the snow to melt.

In ancient Rome it was unlawful for women, or indeed, for young men below the age of thirty, to drink wine, except at sacrifices.

After being exempt from "all taxes and assessments whatsoever" since 1767, land near Blackfriars Bridge in London, that was originally reclaimed to aid navigation, is now being valued for rating.

Originally the raffle stood for any event in which the winner was chosen by chance.

Charles Carroll, the last surviving signer of the Declaration of Independence, nearly a century ago, laid the stone that marked the beginning of the Baltimore and Ohio, America's first railroad.

Dogs in Great Britain have no right on the road. Horses, pigs and fowls have road rights on the public highway.

Cat-call has nothing to do with cats but is the call for the cat (catastrophe or conclusion) of a Greek drama.

Change of Address

1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

Presented in This Issue:

Mr. Ford's Page discusses the title habit, and the false glamour that is created by the indiscriminate use of high-sounding designations. (p. 11)

Nearly every successful writer of fiction selects a prototype from which he draws his principal characters. "Cappy" Ricks, the shrewd old shipowner of the Pacific seaboard, is one of the most delightful of these. Pierce Cumings gives us the story of the man who inspired the novel. (p. 5)

Each year a large number of "lambs" are shorn in the marts of speculation. The "shearing" is done in the course of the marketing of agricultural commodities. Senator Shipstead, of Minnesota, has made a study of this matter and gives us his conclusions. (p. 2)

How the upper classes in Central America are actually "homeless" is the story told by Thomas F. Lee, an authority on Latin America and its people. (p. 24)

Just how Japan feels toward America, after the differences of opinion that have taken place between the two nations, forms the subject of an enlightening article by William E. Barton, the distinguished biographer of Abraham Lincoln. (p. 6)

Boys and girls of America are doing good work in reforestation. (p. 20)

Max Bentley gives us a thrilling contribution in the story of "The Still-Hunt," in which man, the panther, and the doe are the principal actors. (p. 12)

The Count of St. Germain is the "Romantic Rascal" of whom Charles J. Finger writes this week. It is a story of the days before George Washington was born, and it introduces much interesting history which the history books have neglected. (p. 16)

In our childhood's years we sang: "Little drops of water, little grains of sand, make the mighty ocean and the beauteous land," but the land would not be beauteous at all were it not for the drops of water. (p. 15)

The story of the Greely Arctic expedition is an epic of heroic struggle and achievement. Brigadier General Brainard, one of the two survivors of the expedition, gives us his experiences. (p. 18)

The popular conception of how famous athletes make their records is completely shattered by what G. C. Allen tells us. (p. 22)

The great majority of people accept the calendar, like lots of other things, as a matter of course; but it took thousands of years to bring the calendar to its present shape and perfection. (p. 8)

Much romance will be found in the relation of what our forefathers had to put up with in the old coaching days. (p. 31)

HENRIK SHIPSTEAD,
U. S. Senator for Minnesota.

The Shearers and the Shorn,

Or Lambs That Find the Wind Untempered

By HENRIK SHIPSTEAD
U. S. Senator for Minnesota

TALLEYRAND, the reputed founder of modern European diplomacy and political intrigue, is said to have boiled down his philosophy, in substance, to the following: "Society is divided into two classes—the shearers and the shorn. Wise men join the former and avoid being caught with the latter!"

The ranks of American statesmen, even of the present time—if we may judge by the Talleyrand standard of political efficiency—are not without "wise men." In the field of commerce and finance, however, we behold the epitome of the Talleyrand philosophy carried out on a magnificent scale, as we watch the flying shears of the Chicago wheat pit and New York Stock Exchange engaged in their springtime industry of "fleecing the lambs."

Spring the Season For Shearing

Spring seems to be the scientifically appropriate and popular season for shearing the flock in the marts of speculation—at least, that is notably the case in the marketing of agricultural commodities, such as wheat. Consult recent history—the wheat market of 1925, of 1922, and of 1921. After the bulk of the wheat leaves the farm, during the autumn months, the price begins to soar. The "bull" movement reaches its peak somewhere between the end of January and the first of March. Then the "wise men" of high finance take their profits, the market collapses, the "public" shoulders the wreck, and we have the "fleecing of the lambs."

During the past four years, the country has gone through that shearing process three seasons, as follows:

Market Year	*Peak Price Month*		*Low-Price Shearing Time*	
1925	January 28,	$2.06	April 3,	$1.36
1922	March	$1.72	July	$1.05
1921	February	$2.02½	April	$1.23½

Intrinsically, or in accord with the law of supply and demand, the wheat was more valuable in the spring, when the price was at the lowest ebb, than in the peak-price winter months. Both the carrying costs and the diminished supply should normally have added to the value. But what has the question of cost or value to do with the gambling game of the bulls and bears?

Here we have it, in three years out of four, the market price on the grain exchanges drops an average of 70 cents a bushel in the brief period of 60 or 90 days. The volume of the loss no man can compute. If the loss were confined to the actual wheat handled, the shrinkage on the American wheat crop would amount to hundreds of millions of dollars *per annum*. But the gambling is by no means restricted to actual wheat. For every bushel of actual wheat, there may be scores of bushels represented by "futures."

What Happened on the "Black Friday"

On "Black Friday," March 13, last, Chicago alone sold 149,000,000 bushels of wheat "*futures*." During the week ending March 14, Chicago sold 527,000,000 bushels of wheat "*futures*"—or, double the "world visible supply." In the month of February, the Chicago sales of wheat "*futures*" reached 1,581,000,000 bushels—or, one-half the entire world production in the Northern and Southern hemispheres during the crop-year 1924-25. Indeed, the Chicago sale of "futures" has no parallel unless it is the post-war inflation of rubles, francs, and marks. The ultimate result of this American "future" inflation finds a parallel again in European rubles, francs, and marks—as witness the inevitable collapse and the shearing of the victims.

The defenders of this national gambling game tell the farmer: "You do not suffer by the transaction, because when the market collapses only 15 to 20 per cent of the crop is in farm hands." That is true, both as to the peak-price month and the date of the collapse; and yet the wheat-raiser suffers irreparable damage in three ways:

1. The up-and-down market cuts down the normal mill consumption by making the milling, baking, and other cereal industries a dangerous hazard; while the artificial "bull" price reduces final consumption.

2. The inflated "bull" market inspires overproduction of wheat in every wheat section of the globe. The Department of Agriculture estimates that the effect of the recent "bull corner" is to increase the wheat acreage of the spring wheat section 14 per cent for the crop now being sown.

3. Market inflation and collapse makes the wheat-raising industry a hazardous gamble in itself. The main staff of life for 112,000,000 persons becomes a counter in a gambling game, and the producers have about as much chance for honest marketing of their crop as the followers of *rouge-et-noir* at Monte Carlo have for an honest fortune.

One of the most unpleasant features of the situation is that the government itself—whether with the mistaken notion of helping the farmer, or for political reasons of its own—too often is a party to developing the inflated price bubble, which is the inevitable cause of the ultimate collapse. Early last season, the Department of Agriculture aided the "bull propaganda" by estimating the American crop as *below normal* and less than 700,000,000 bushels; whereas, we had a bumper crop of 872,000,000 bushels.

When the Wheat Soared

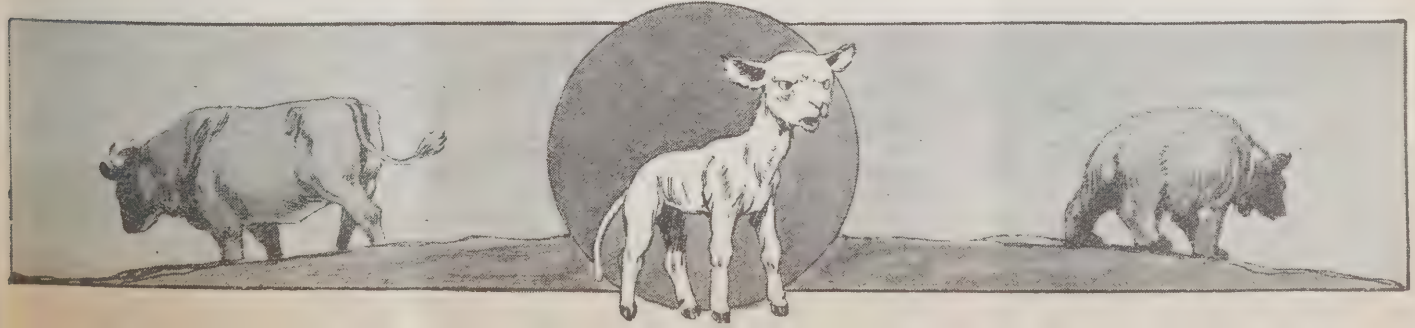
Then the "world scarcity" theory was heralded far and wide. Now it appears that the world crop of around 3,100,000,000 bushels, though less than the record crop of 1923, is above the average crop since the World War and above the normal world requirement for consumption. The British estimate of exportable surplus and requirements—now generally accepted as shown by the market—for the crop year ending July 1 is as follows:

Surplus of exporting countries, 824,000,000 bushels

Requirements of importing countries, 784,000,000 bushels

Thus the collapse of a fictitious and artifically inflated "bull" market brings with it a world-wide advertisement that our government official estimates are discounted and discredited in the markets of the world. Moreover

THE BUBBLE BLOWERS



our Department of Agriculture, charged by Federal statute with the administration of the Grain Futures Act, is in the position of aiding the false "bull" movement in grain "futures" which is the cause of the financial collapse and all of its attendant evils—including the effects upon the price of bread to 25,000,000 families, the disastrous effect upon milling and other cereal industries, the hazard to the wheat-growing industry, and the commercial and financial failures following in the train of a broken-down market.

The wheat skyrocket started from its Chicago foundation early in the late political campaign at $1.03, soared to around $2.06 at the end of January, kept up its high flight for about 30 days to $2.02 on March 3, and finally fell to earth below $1.40 by April 3. That was the route of the "May future." The "July future" which is timed to catch the incoming winter wheat crop ranged 10 cents or more lower still; while the "September option," staged to meet the autumn spring wheat crop, is around 15 cents below "May." The average farm price will naturally net about 15 cents below the Chicago "future"; so the growers of the largely increased 1925 acreage may look forward to a farm price between $1 and $1.25. As this is not a political campaign year, they must not expect rainbow "prosperity."

The companion "prosperity" show to that staged in the Chicago wheat pit was the stock market "picture" thrown on the New York screen. The Chicago "bull" show had the Department of Agriculture for advance agent. The New York Stock Exchange dramatic exhibition was fortunate in securing the able and inspiring coöperation of the Treasury and Federal Reserve Board.

The Federal Reserve System

The Federal Reserve System, as originally conceived, was intended to check the tide of the country's bank reserves to Wall Street for stock speculation. For years the bank reserves of the entire nation would flood into Wall Street, and when the stock market boom eventually collapsed, as balloons and bubbles do, the country had a "panic"; and even a school-teacher out in the Far West could not draw her small savings from the local bank, for the bank reserves were in the stock-gambling wreckage.

So, twelve years ago, Congress established the Twelve-District Reserve System to prevent the Wall Street bank reserve concentration. More than that, a check was placed on Stock Exchange gambling by establishing a high rate on "call loans." The average "call rate" on stock exchange loans for five years prior to the autumn of 1924 was 6 per cent.

What was the "call rate" for the 1924-25 "prosperity" picture? The lid was taken off by the Federal Reserve Board, and the "call rate" cut down to 2 per cent. "Call" loans got an interest rate, *not only less than half the current commercial rate* on gilt-edged paper, *but half that named by Secretary Mellon on his new issues of Government bonds!*

Besides the 2 per cent "call rate," the Stock Exchange speculators were inspired by a tide of loanable funds—released by the kindly offices of the Treasury and Federal Reserve Board. Financial editors estimated that at least $1,000,000,000 of the loanable funds was due to governmental beneficence. But the total of Stock Market loans, estimated by officials of the "Street," is placed at more than $2,000,000,000.

This tide of Stock Market loans, at the low "call" rate of 2 per cent to 3 per cent, was the yeast of the "prosperity" boom. In the short period of 90 days the level of leading stocks was lifted 25 points and added $6,000,000,000 to their "picture" valuation.

The public is familiar—perhaps unhappily too familiar—with the history of that melodramatic scenario. In a brief article one can only touch a few high spots. Let us see what happened, for example, to the leading iron and steel shares.

STOCK MARKET PERIOD OF "PROSPERITY" INFLATION

Company	*Amount of Listed Stock on N. Y. Exchange*	*Price Gain Over 1924 "Low"*	*Amount of Paper Inflation*
U. S. Steel	$508,495,200	35 pts.	$175,000,000
Bethlehem Steel	180,151,000	15¾	28,350,000
American Car and Foundry	30,000,000	78	23,400,000
American Can	41,233,000	89	36,720,000

The common stock listed on the exchange for these four iron and tin companies aggregates approximately $760,000,000. The aggregate inflation of value for the January-March high point above the 1924 "low" is $263,000,000, or an average "prosperity" margin of about 35 per cent of par value.

Then what happened? It was not until February that the public got the full data of the calendar year production. During the four months beginning with the November election down to February, the press had been flooded with "prosperity" news issued not only from the "Street" but from government departments. It had been taken for granted that the industrial production for the full calendar year 1924 was the basis of the stock market boom.

Swindled by "Bull" Propaganda

Then came the February "Survey of Current Business" by the U. S. Department of Commerce and the calendar year summary by industrial journals. Official industrial facts now loomed up behind the camouflage. This is what the amazed investors in iron and steel stocks then saw—as an industrial basis of production for the skyrocketing of their shares:

Iron and Steel Production	*Calendar Year 1924 Tonnage*	*Previous Year Tonnage*	*Shrinkage 1924*
Iron ore, tons	42,452,000	59,200,000	16,748,000
Pig iron, tons	31,088,000	40,039,000	8,951,000
Steel ingots, tons	36,645,000	43,486,000	6,841,000

The investor had been swindled by "bull" propaganda in the case of industrial stocks, as in the case of grain. The whole thing was camouflage.

However, the hopeful investor—at least, the "public," that is, the "lambs"—hung on yet awhile, thinking that when the U. S. Steel Corporation annual report came out there would certainly come forth some encouragement.

Finally, in March came the "Steel" annual report; and when the screen had been removed, this is what the startled investors in "Steel" common saw:

U. S. STEEL CORPORATION PRODUCTION AND EARNINGS

	1924 Decrease per cent
Iron ore mined, tons	20
Blast furnace product	24
Steel ingot product	19
Finished steel product	20
Steel rail product	15
Average number employes	20
Net earnings	18

The "Steel" report was the final icy blast that blew away the "prosperity" bubble. Thereafter, the New York Stock Exchange boom followed the collapse of its companion show in the Chicago wheat pit. They were twin shams worthy of Barnum's palmy days, but without the Barnum frankness and humor.

What Happened to the Stock Market

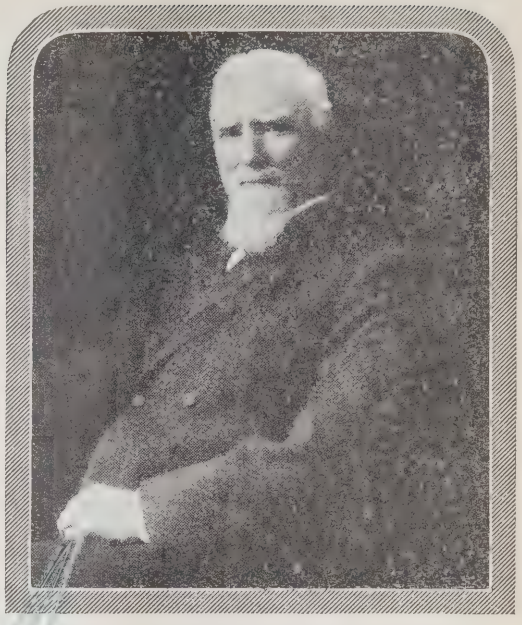
What happened to that "prosperity" stock market? No one likes to look at that shrinking and collapsing picture. Bursting bubbles are not much to look at. Who cares for the detail of such things as these: American Woolen dropping from 64 to 36; Baldwin Locomotive falling 36 points in 30 days; Chicago, Minneapolis & St. Paul Railway dropping from 16 down to 5 and a receivership; General Electric, an industrial leader, falling 92 points in six weeks; and even the conservative Steel Corporation losing 15 points on its half-billion of listed common.

This is the world's leading nation—a republic of 112,000,000 citizens, endowed, in the main, with freedom, common sense, and common honesty. This is the world's leading nation in industrial production, and at present so advanced in banking power as to be heralded as the creditor nation of the world. It is to be hoped that the time may come—under a free and intelligent ballot and under a free and some time independent press—when such a national sham as that which we have just witnessed in the Chicago wheat pit and New York Stock Exchange shall not prosper under the government and become a national disgrace.

The Real 'Cappy' Ricks

Captain Robert Dollar, Original of Kyne's Genial Hero

By PIERCE CUMINGS



CAPTAIN ROBERT DOLLAR.

A FEW years ago an American startled the calm tranquillity of Chinese officialdom with the announcement, "I am going to operate a line of steamers up the Yangtze River to Chungking."

Now the Yangtze-kiang is no ordinary river, nor was this an ordinary statement. It took the officials some time to regain their composure, but when they did they merely shrugged their shoulders in the placid Oriental fashion.

"Why," they said in effect and in unison, "it can't be done."

And so indeed it seemed.

Chungking is on the very "Roof of the World," in the heart of the Dragon Kingdom, fourteen hundred miles inland from Shanghai. For ages primitive Chinese junks in their tedious, haphazard manner had traveled certain parts of the great waterway, but for steamers, and under the American flag—oh, impossible!

There were miles of treacherous rapids to negotiate, deep gorges and cañons, sharp twists and turns. There was Ichang Gorge, a sheer cliff hewed in solid rock fifteen miles long; there was Yao Tsan Ho, a long stretch of dangerous rapids; there were the Gorges of the Yellow Flower and the Brass Gong.

There was Washan Gorge, twenty-two miles in length, with its towering, threatening cliffs rising sometimes to a height of five thousand feet, and shutting out the sun.

And there were the bandits!

"It can't be done," the Wise Men of the East reiterated.

But the American did it.

He designed and built special steamers to battle through the rapids. He brought brave men, and skilled, from his own country to man the ships.

When the steamers were first fired upon by the bandits he had the pilot houses incased in armor, and he mounted guns on the forward decks. And the ships continued to sail!

That American was Robert Dollar.

Not very long ago, as time is rated, he was a penniless chore boy, a cook in a shanty, a roustabout logger. Today he is hailed as probably the greatest figure in shipping that the United States has produced in the century.

He was a failure at twenty-eight. And yet a few months back he amazed traders of all the world by starting a line of ships around the globe that operates on railroad schedule, fourteen days apart—an accomplishment unheard of before in all the history of commerce.

Where others have dreamed of worlds to conquer Robert Dollar has conquered them; where others have prophesied he has produced; where others have hesitated he has plunged in and won. The storms of the sea have not stopped him, nor have the obstacles on land.

Does all this sound like fiction? Possibly it does, and with reason, for Robert Dollar is known to thousands of Americans not as the flesh-and-blood sailor of ships and master of men, but as "Cappy" Ricks, the genial, hard-headed, astute hero of Peter B. Kyne's popular stories.

From the abundant wealth of Robert Dollar's life has been drawn much of the material for these famous tales of the sea. The names have been changed in their translation into fiction, and some of the circumstances, but the yarns told as fiction are no more interesting, no more engrossing than the incidents in Robert Dollar's life on which they are founded.

The Dollar ships weave their way ceaselessly over the seven seas. In Boston Harbor they are familiar sights, or in Penang, which is on the tip of Malay, in Marseilles, or in Port Said.

Robert Dollar would be better known to the men of his own country were it not for his own modest disposition. The blatant publicity-seeking methods of certain other prominent men in this country are extremely distasteful to him.

But to the people of other nations, to the men, say, of China or of Scotland or of Siam, he is not only recognized as the able business man that he is, but he is honored as one of the greatest of all Americans.

"Robert Dollar," said one authority on the Orient recently, "is regarded by high Chinese officials as the godfather of their country. He probably has more influence there than any other American who ever lived, possibly than any other Occidental. He is largely instrumental, through his own personal efforts, for the wide spread of Christianity in China in recent years."

Not long ago Captain and Mrs. Dollar celebrated their fiftieth wedding anniversary. Hundreds upon hundreds of messages and gifts poured in from all parts of the world, from monarchs and from peasants, from prime ministers and from storekeepers, from leaders and from laborers, all of whom call Robert Dollar "friend."

Captain Dollar is extremely reticent about giving advice. He has no cut-and-dried formula for success. He is not one to say: "Do as I have done and you will be great!"

But he would be thoroughly justified should he ever feel tempted o say this, and those who are about to start on the highroad of life might do well to follow certain rules he has laid down for his own conduct.

Captain Dollar does not smoke, nor do those close to him. He does not use intoxicating liquor. All his life he has been a hard worker. He has cut for himself tremendous tasks, and he has done them.

He has conserved his strength by using it. Now, when he is more than eighty years old, he is still possessed of a powerful physique and he has more stamina and endurance than many men half his age.

He is an inveter- (Continued on page 28)

How Japan Feels Toward America

Anxious to Secure the Good Will of This Country and Deserve It

By WILLIAM E. BARTON

William E. Barton, the distinguished biographer of Abraham Lincoln, is making personal observation of public opinion around the world. In this article he gives his impressions of Japanese opinion.

IT HAS often been remarked by European writers on America's foreign policy that while the United States has pursued a very conservative method in her dealings with European nations, she has opened a method almost wholly the reverse in dealing with affairs in Asiatic countries bordering on the Pacific. Washington's farewell address has never restrained the great American Republic in its dealings with trans-Pacific peoples. The United States liberated Cuba, and set her up in business for herself. In the same war, she liberated the Philippines, and kept them. Of course, the two situations are not parallel, but it is hardly thinkable that the United States would have taken over Madeira or Malta as she took over the Philippines.

Delivering a Letter to the Shogun

The classic illustration of America's assertion of her paramount interest in the Pacific is, of course, her dealings with Japan. On July 8, 1853, Commodore Matthew Calbraith Perry anchored his four United States warships in Uraga Bay and delivered to the Shogun a letter from President Fillmore intimating, as politely as a Western nation knew how to intimate by means of warships well armed, that the United States would like to open commercial and diplomatic relations with the then hermit empire of Japan. This resulted in the famous treaty of Kanagawa, the first treaty which Japan made with any outside nation looking toward commercial and diplomatic relations. This treaty was not signed until the following year, and its negotiation was preceded by an interchange of presents.

Among the presents of the United States, made to the Government of Japan, was a half-size locomotive, tender and car, with a track leading from a convenient point on the shore up near Yokohama toward the palace. I once heard a description of this little railway train by an officer who accompanied the expedition, and he said that the front of the engine had the form of a dragon, and that the smoke and steam exhaust was through the dragon's mouth. When the Japanese saw this monster coming up from the beach with Americans riding in the car, they were in a state of mind that will not require description.

Among the presents, as reported by Admiral Perry in Volume I, page 357, of his official account, there was also a telegraph, with three miles of wire. He also listed a good number of books and official reports of the United States, with maps and telescope. He mentions also a barrel of whisky, five Hall's rifles, three Maynard's muskets, twelve cavalry swords and an assortment of agricultural implements. There were certain cases of wine and champagne. There were fine broadcloths and brocades and an assortment of perfumery.

He also lists among the presents made by the President of the United States to the Shogun of Japan, "Three ten-cent boxes of fine tea." If ever owls were carried to Athens or coals to Newcastle, it would appear to have been in the boxes of tea given not only to the Shogun, but to other high officials of Japan. I cite the volume and page above so that any one who is curious may look it up in the original report.

All of which is by way of saying that the United States, intent on preserving the Open Door policy in the East, pushed that door open in the beginning, and set a firm foot across the threshold as soon as Japan furtively opened a crack to discover who was there and what in the Orient was wanted.

Everybody knows that Japan has looked to America as her nearest and best friend; that she is one of our best customers and we are her very best, and that in tradition and history Japan and the United States have much to unite them. Also every one knows that relations have become somewhat strained of late. President Wilson came to a direct issue with the representatives of Japan at Versailles over the Shantung matter, and was compelled to assert his faith that Japan would keep her agreement and get out of Shantung in fifteen years, which promise the American people were not inclined to believe, and which Wilson was reluctant to accept in lieu of frank abandonment, but which Japan appears to be keeping in good faith with a margin to her credit. And everybody knows of the Japanese Exclusion Act, grafted upon the emigration law, reluctantly signed by President Coolidge.

Probing the Opinion of Japan

That this exclusion law profoundly shocked the Japanese people is undoubted, and there has been much talk to the effect that American tourists are insulted in Japan, and that Japan is ready to retaliate and even to find an excuse for war in consequence. Although my visit was a short and hurried one, it took me to the great centers —religious, political and commercial— Yokohama, Tokio, Nikko, Kobe, Osaka, Kyoto, and Nara, and in every one of these places I found some opportunity to discuss matters with Japanese people and with Americans resident in Japan. I talked with high representatives of the Japanese Government, with Honorable E. A. Bancroft, with the Ambassador of the United States, with American business men and missionaries, and with Japanese business and professional men, many of them educated in American universities. I had no means of conversing with the laboring men, but I encountered thousands of them as I passed through the streets, and had more or less restricted conversation with guides, chauffeurs, and ricksha men. I also have been during these few days a diligent reader of Japanese newspapers, and I have accompanied groups of ladies to the shops and stores. This experience is the basis of such information as has come to me, and I give it for whatever it is worth.

Friendly But Bewildered

First, I am satisfied that this group of people, very small, of course, in proportion to the whole population, but representative of the life of the cities if not of the nation, all cherish a deep feeling of friendship for the people of the United States. I attended a reception given to the people of our ship by the Japan Woman's Peace Association, tendered in the home of Baron Okura at Tokio. The women who, in addition to Mrs. Okura, acted as our hostesses were some of them Japanese and some American. I attended in the same city the annual banquet of the Rotary Club, held in the Banker's Club. Let no man suppose that in Japan the members of Rotary slap each other on the back and call each other by nicknames or sing "Old MacDonald Had a Farm" or "I'm a Little Prairie Flower." It is a most serious and dignified body, trying painfully hard to be a trifle frivolous for our sake. At my right sat a baron of high distinction and at my left the head of one of the largest business concerns in Japan, and across the table was the American Ambassador.

In Osaka I attended a banquet of church leaders. I think three Americans were present besides myself, the rest being Japanese preachers and laymen. Among the latter were two editors and a number of prominent business and professional men. I suppose that the church in which this banquet was served may have cost $150,000,

and it was about as complete a plant for all kinds of religious and educational and social work as can be found in an American city. I ate more slippery things that night than I have ever eaten at any one meal—raw fish, and fishes' eyes, and bamboo sprouts and boiled mushrooms and many things I did not recognize. I began with chopsticks, but after the meal was about one-third finished, a fork and spoon were surreptitiously slipped to me, a delicate intimation that I was not getting on very well with the sticks. It was no ordinary meal, and the men who sat with me were no ordinary men.

Now, all these people, and all these groups of people and other and experienced groups of American teachers and professors in the Doshisha and in Kobe College and other schools, tell me that, whatever may be said in the yellow press of Japan, the Japanese people have the friendliest feeling toward America, but that they are somewhat bewildered by the exclusion law, and exceedingly sensitive at what seems to them a blow from the hand of a friend.

But when I attempted something in the way of explanation, as once or twice I did, I was courteously but promptly reminded that this was unnecessary. The men to whom I talked knew perfectly well that the so-called "gentlemen's agreement" was not a treaty, and that the United States had good right to control its own immigration policy, and that Congress does not control the Legislature of California nor the President interfere in the courts. They understood as well as I did the distinction between the local and the national aspects of the matter. What hurt them was the feeling that they had been discriminated against as supposed inferiors.

A Clever Way to Give an Affront

I found a few Americans who told me of having heard discourteous words or having suffered discourtesy at the hands of some officials soon after the exclusion act was passed. One American who has been in Japan for about two years told me of a number of such instances, all of them having occurred immediately after the exclusion bill and some of them his own experiences. I have no doubt he told me the truth. One missionary told of a polite insult which he received at the time. He entered a street car, and a Japanese gentleman of repute rose and offered him his seat, saying, "You are an American; I give you my seat." This missionary said that this act of irony was intended as an insult, and was so understood by the people in the car. But he had the good sense not to resent it; and, indeed, it was a very clever way of offering an affront and no one admired the skill of its administration more than did the missionary.

But if there were any such acts immediately after the exclusion bill, they were not violent, in any case of which I heard, and they did not last long. At the present time, Japan is doing her utmost to show courtesy to every American who visits the island empire. Some of my friends in America told me it would hardly be safe for an American to visit Japan. Nothing could be further from the truth. I am confident that never has Japan been more determined to seek the good will of the United States than just now.

I visited one of the common schools, a large one. The children were expecting an American deputation. They had flags, all of them made by the children themselves. Half of them were the Stars and Stripes and half of them were the flag of Japan with its red sun on a field of white. The children waved them and intertwined them as they sang to us. They could not speak our language, but they sang songs that we could not fail to understand.

As we passed along the streets, the workmen on the highways and the people who stood aside for us, and who greeted us from their doorways, all showed us courtesy, and none of them were seen to turn after we had passed to sneer at our appearance, though some of the Japanese women were visibly amused at some of the headgear of the American women, and no wonder.

Why Foreigners Own No Land in Japan

Some reader will say, "These affairs were staged for the benefit of American visitors, and the Japanese may have been dissembling their real feelings for commercial reasons."

Some of the events were staged, as the banquets and formal receptions and school exhibitions, but that does not prove them insincere. But the hearty salutations of the common people as we passed them, and the smiling greetings of women and children, were not staged, and could not all of them have been insincere. I think none of them were hypocritical.

I write this the day of my departure, while there is still pending a bill introduced in the Imperial Diet a few days ago making it possible for foreigners to own land in Japan. Men who are in position to judge, tell me that the bill is likely to pass. If so, it will have become a law by the time this is printed. If the bill passes, it will begin a new era for American investors in business and philanthropic work. If not, it will be of interest to relate what is the present situation. (The Japanese Embassy at Washington advises that the Imperial Diet passed the law permitting foreigners to own land in Japan.—Ed.)

The unit of land in Japanese measurements is the *tsubo*, being a square of six feet, containing an area of thirty-six square feet. All Japanese land measurements are in *tsubos*. Land under the old law could be owned in fee simple by the Japanese but not by foreigners. As the law has been, an American could not buy the land for his factory. He would have to lease it for a period perhaps of 999 years, and have it held in the name of a *zaidan*, or quasi-corporation. The buildings of the Y.M.C.A. in Japanese cities, and the hospitals and colleges of American origin were all so held. The *zaidan*, or juridical persons, had to meet once a year, on a definite day, and at a stated hour and minute, and report to the government as so meeting.

This answered very well for a corporation, but the American resident in Japan, the secretary of the Y.M.C.A., the manager of the plant, the surgeon at the hospital, and the teacher in the school, who would like to own their own homes, could not do so. There was much discussion of the proposed new law, and I think an editorial which appeared recently in the Osaka *Mainichi* is fairly typical of the feeling that has been expressed to me. The editorial was placed in my hand by its writer, Naoshi Kato, assistant editor-in-chief, and principal editorial writer in the *Mainichi*, which also is issued in a Japanese edition as the *Nichi-Nichi*. It is a paper owned, edited, and controlled entirely by Japanese. Mr. Kato said to me in conversation that his editorial, as he believed, expressed the judgment of the paper's constituency in saying:

> "We are in full accord with the fundamental spirit of the present bill, not only because it is most timely so to alter a law promulgated over 50 years ago as to meet the demand of the new age, but because there is no possible harm whatsoever in allowing foreigners to own Japanese land and absolutely no danger of our land's being occupied by foreign landowners, due chiefly to the fact that the value of land in our Empire is by far the highest priced in the whole world.

Japan Desires Confidence of United States

> "Supposing that many foreigners and their corporations buy our land, such an event must be welcomed by us Japanese, because of the consequent investment of more foreign capital in this country. The full ownership of land will surely stimulate foreign business men to reside longer and put up permanent enterprises in the land.
>
> "It is our earnest wish that this magnanimous law be enacted as soon as possible, and be so applied as to show the world the true spirit of Japan, who so ardently claims indiscriminative treatment of all peoples irrespective of race, creed, or birth."

There is a militaristic party and a yellow-journal group in Japan as in the United States. Japan is harder hit by the earthquake than the world knows, and is poorer in purse and soberer in judgment than she was at the end of the World War. She greatly desires the confidence of the United States, and I think is earnestly desirous of deserving it.

How We Got Our Present Calendar

Babylon and Egypt Began the Job and Julius Caesar and Pope Gregory Finished It

By LOUIS C. KARPINSKI

THE close contact of modern man with civilization of the past is really made every day and every hour with the clock and with the calendar. Why do we have twenty-four hours in the day, and whence come the sixty minutes in an hour, and the seven days of the week? The answers to these questions carry us back to Babylon of old, to Egypt, and to Greece, and to Rome.

Whenever you tell the time of day you pay an unconscious tribute to the Babylonians who divided the day into twelve double-hours and the hour into sixty minutes. Whenever you give the day of the week you connect again with Babylon. When you give the month of the year you touch the hand of Julius and Augustus Caesar whose names are reflected in July and August. The year itself connects with Christ and the civilization of Palestine. In this way the hand of time points not only forward but also backward.

The sun is the most striking object which the heavens offer to the gaze of earth dwellers. The time from sun to sun—whether from sunrise to sunrise with the Arabs or from sunset to sunset with the Hebrews or from high noon of the astronomers to high noon is the most natural division of time, the solar day. How far back into the history of primitive man this day appears is not a matter of record. Certain refinements in the day could not be made by the early primitive men, requiring too great care in observation over a long period of time.

The sidereal or star day is the unit of time of the astronomers. This is the time from the passage of some star across the meridian to the next passage of the same star. However, as the earth moves about the sun, an apparent movement of the sun takes place as viewed from the earth. The result is that when 365 solar days have passed the earth has completed about 366 complete revolutions about its axis. Again the earth does not move with the same speed at every point in its path about the sun, moving faster when nearer the sun, and also the path of the earth in its elliptical orbit about the sun is inclined to the plane of the Equator. These peculiarities cause trouble when you begin to inquire too closely into the length of the solar day by which we live our lives.

Undoubtedly the moon next claimed the attention of primitive man and the period of its passage about the earth is termed a month. The time between two successive full moons, the so-called synodical period, is 29 days, 12 hours, 44 minutes, 2.8 seconds. Quite certainly the seasons, particularly summer and winter, made a vivid impression upon primitive man, particularly when suffering from a combination of hunger and cold. The necessity of planning for food, to plant and care for grains, undoubtedly made the savage take note of days and seasons and finally to form some sort of calendar.

Rustic calendar of the Romans.

In Babylon and in Egypt the sky is much clearer than it is here. In consequence the stars and the planets are much more brilliant. Then, too, the primitive people spent much time, "abiding by their flocks by night" and out in the open spaces. The passage of the earth about the sun, with the varying position of the sun in the heavens, combined with the four seasons, impressed the year upon man. Unfortunately for the calendar the earth takes 365 days, 5 hours, 41 minutes, and 46 seconds (365.24220 days) to complete its course about the sun, and these extra hours and minutes and seconds have caused endless calculations and computations from the time of Julius Caesar to the present. Neither with the month nor with the day does the year harmonize and this has given astronomers a great deal of business.

The Egyptians first enjoyed a single year of twelve months or twelve-moons, but the seasons becoming dislocated the Egyptians introduced five extra holidays at the end of the year. Christmas vacation probably dates from this Egyptian custom, but not certainly. Christmas itself appears first in the first Christian Calendar, that by Pope Liberius, made in A. D. 354. However, in 228 B. C., the Egyptian knowledge of the heavenly bodies had progressed to a leap year and to the Egyptians the ladies owe a special vote of thanks. Julius Caesar, with the aid of an Egyptian named Sosigenes, placed leap year on the map in Europe, and our modern calendar definitely begins with the Julian Calendar of Caesar.

Our months come to us largely from Rome. Particularly in the words September, October, November, and December, we have the Latin words for seven, eight, nine, and ten or *septem*, *octo*, *novem*, and *decem*. In the old Roman calendar the months began with March, making these months the seventh to the tenth. Originally July was Quintilis but Julius Caesar honored the month (or himself) by renaming the month July. The Romans numbered the days backward from the beginning of the next month; December 25 would be the seventh before the Kalends of January (our New Year). The word *calendar* comes from Kalends.

Caesar rearranged the calendar in 45 B. C., with every other month having thirty days:

> January 31, February 29, March 31, April 30, May 31, June 30, July 31, Sextilis 30, September 31, October 30, November 31, December 30.

When Augustus Caesar became sufficiently powerful he persuaded the senate to change Sextilis to August and not to have a short month, less than that of Julius, and also to have the luck of odd numbers August took another day from February. Probably at this time, in order not to have a succession of long months, September and November (*Concluded on page 23*)

Australian State Shipping Failure

THE recent decision of the Australian Government to invite tenders for the purchase of the Commonwealth Shipping Line as a going concern is a matter of special interest to the American people. The experiences of Australia and the United States in regard to this experiment in nationalization are very similar. Both enterprises originated during the war, and both are designed to meet an unprecedented condition.

In the summer of 1917 shipping became a tremendous concern to the Allies, and Australia's peculiarly isolated position demanded that she should provide for her own needs. Now shipbuilding is not an industry that can be created overnight, but the Australian authorities determined that it should be established as quickly as possible.

The war came to an end before any results were forthcoming, but the work was carried steadily forward, and the first Australian-built ship, the *Delunga*, was launched in 1919. Two years later, the Federal Minister of works and railways made a statement to the effect that the Commonwealth Government Line was then operating forty-seven vessels. He further declared that every effort would be made to carry on the shipbuilding industry, which he insisted was "essential to the trade and commerce and producing interests of the Commonwealth." In spite of this, the enterprise was a financial failure from the start. When the Australian shipping board made its decision to sell, no fewer than twenty-one of the remaining thirty-two vessels under the board's control were laid up in idleness, while the remainder were merely incurring losses.

The report attributes the failure of the line to high running costs as compared with competing lines; to labor troubles, and to the unsuitability of the character of the tonnage. No doubt all these were contributing factors, but the decisive cause of failure in Australia, as in America, seems to have been one that is inherent in nationalization. In the shipping industry, perhaps, more than in any other, individual enterprise and cumulative experience play a decisive part. The way of the sea is one that cannot be mastered overnight. Although there was a strong desire in Australia to maintain its Merchantile Marine for patriotic reasons, there is now a growing consensus of opinion that the government is right in its determination to cut the loss of some eleven million pounds, which the enterprise has involved, and to transfer the ships to private owners.

Watchman, What of the Night?

ONE of the most important questions of the hour is—What is really happening in Japan? The sudden extension of manhood suffrage to a people almost entirely unaccustomed to any exercise of political power has created a situation well-nigh unprecedented in history.

Writing from Tokio to a representative of this paper, quite recently, a well-known authority on the Far East puts the matter in a nutshell. "The air is full," he says, "of new political projects, organizations, clubs, factions, castles, and bubbles. It is something like the preparation for the rush upon some new territory to be opened by a government for free settlement upon the firing of a gun. In this case the gun will be the signature of the Prince Regent." Intellectual Japan, he insists, regards the new measure as tantamount to "distributing rifles, razors and bombs as playthings among lunatics and children."

The fact is, of course, that intellectual Japan is reaping the whirlwind of a tragic paternalism. When the country began to recover from the disaster of September, 1923, it was to emerge into a new and bewildered life. For a time, the old intellectuals still held the reins; for a time the propaganda of optimism desperately fostered by the government had its effect, but gradually the deferred hope made the heart sick, and the Japanese peasant and artisan became an easy prey to a "liberty" crying press. The result is manhood suffrage and a condition of uncertainty, the like of which has hardly ever obtained among a great people before. The momentous question—What of the Night in Japan?—the future alone can answer.

Crime and the Daily Press

A WELL-KNOWN daily journal declares itself unable to become excited over the perennial dispute as to the proper place for crime stories in a newspaper. It quotes, as best expressing its viewpoint in the matter, the remark of a New York columnist: "A well-known sociologist says the newspapers print too much crime news. The criminals agree with him."

This, we think, is typical. By treating the question as though it were one of substance, instead of form, the average daily can always manage a plausible "answer" and avoid at the same time coming to grips with the problem at all.

Assuredly crime stories have a place in the daily news. Just as certainly they should be given the space, emphasis and detailed exposition their importance to society deserves. This is precisely what a number of newspapers fail to do. They not only emphasize a crime story disproportionately; they emphasize details which have properly no place in the story at all; and over and above this, they place tragic and romantic halos and auras round the persons and scenes concerned.

Usually the persons concerned are not noticeably more tragic or romantic than the rest of us. Many of them are poorly organized, some of them brutish, most of them downright dumb. As for the scenes—were the atmospheric and light effects introduced by the news writer removed, the ordinary observer would see them as phases of an unhappy, despairing struggle on the part of persons with mental strabismus to get wealth without working for it.

More newspapers could see this if the journalistic world were less favorable to the logic of Pecksniff and the temperament of Bertha Clay.

On the Fall of Civilizations

A RECENT *Atlantic Monthly* article warns us of an impending peril. It's the same peril that has been impending since 1905 or so. Our civilization is in danger. Why? Because we are coming culturally to the same condition that Rome came to, before she dived off with a low but heartfelt sob into a glorious oblivion.

The way of it is this. Even as Rome, we are increasing our margin of leisure by letting our slaves work for us. Our slaves are not human but mechanical. However, that makes no difference: we have the leisure. The question is, what for? For movies, jazz, and other feverish activities. Thus we are disintegrating rapidly. Soon we shall be material for history. Soon we shall be merely inspiration for the Marlowes, Jonsons and Shakespeares of the future. Depressing thought!

What is the remedy? For no prophet ever lets a nation go to its destined doom without intensifying its despair by pointing out what might have been, provided things were what they were not, which seems hardly possible.

The remedy lies in our beginning at once to show the nation what to do with the leisure it does not at present know what to do with. "Come with me," we must say to the fellow amusing himself by braining his family, "escape from boredom in a game of pachisi; here are the macaroons, there the tea." "Follow us," to the lad drowsily slugging the passing citizenry for their cash, "we shall blow bubbles, scanning the while the pleasantries of Agnes Repplier." And so on, through the devotees of less stupid pastimes, until the nation is all occupied with taking correspondence harmonica lessons, coloring photographs and collecting stamps.

Rome fell, our prophets tell us, because she became fat and soft. She became fat and soft because she let others do her work for her. Thus were the social body's muscles vitiated. Are they being so weakened here, now?

Which of Them Knows Least?

MR. CLARENCE DARROW offers to face Mr. William Jennings Bryan on the theory of Evolution, the battle to occur in Tennessee. It is in such exhibitions that one may learn what is wrong with Evolution and why both proponents and opponents can produce such good reasons for their separate stands. For if there is anything that has harmed the theory known as Evolution, it is that every country school-teacher in the land has attempted to teach it from scrappy textbooks; and if there is anything that has harmed the position of the anti-Evolutionists it is their assumption that thinking can be prevented by law.

In the battle of Darrow vs. Bryan there will be a flood of evidence on both sides, but as in the Leopold-Loeb case, it will narrow down to a battle of the "experts."

Losses in the World of Art

SINCE the beginning of 1925 Americans have had cause to mourn the death of two great artists, George Bellows, who died on January 8, and John Singer Sargent, on April 16. But in the midst of our regret that they have died, there exists a heartfelt thankfulness that they have lived. For many of us the image that usually appeared to our inward eye when we heard the words "artist" or "poet" was the figure of a long-haired, Windsor tie-d, effeminate, indolent person, whom men regarded as insufferable, and even the ladies didn't admire, although, apparently, they felt that there might be some occult and superior virtue in, now and then, giving some evidence of having a taste for that sort of person and his works.

It is to all of us who had such experiences in our search for acquaintanceship with artists and poets that the knowledge of Sargent and Bellows came like a clear breeze from the great ocean. They looked like workers, hard, earnest workers, with their hands and with their brains. They have left with us, in the case of Sargent, the frieze of the "Prophets" in the Boston Public Library, numbers of exquisite watercolors, and many penetrating portraits; in the case of George Bellows, a man scarcely forty years old, portraits, sparkling landscapes, and somber, strong lithographs.

MR. FORD'S PAGE

A MAN is just what he makes himself and no title can make him anything else; but there is a glamour about a title which gives a man a false value. There was once an English operatic satirist who wrote about a king who in a fit of excessive benevolence wished all his subjects to be his equals. So he distributed all kinds of titles with a lavish hand, with the result that "Bishops in their shovel hats were plentiful as tabby cats, while viscounts sat at every door and dukes were three a penny."

There is a danger that if certain titles go on multiplying at the present rate an untitled person will soon become a rarity and the absence of any handle to his name a distinction. Americans are amused at the extensive crop of counts, grand dukes, and princelings that Europe has been able to furnish through many centuries of history. We laugh at the huge quantities of medals, ribbons, and other "decorations" worn by these alleged supermen; but do we ever think of the vast collection of "colonels," "professors," and "presidents" which exists in this country—colonels who never commanded a regiment or smelled gunpowder, professors who never saw the inside of a college or occupied a university chair, presidents who never presided over anything.

There seems to be no sense of perspective in such matters, no idea that colonels should command something, that leaders should lead, that teachers should teach. Many of those who seek or who assume such titles forget that they fool themselves more than they do their friends.

In this mad desire for superiority there are many who try to borrow reflected glory from someone who has long since passed away. They will tell you that their forefathers came over with somebody who is supposed to have made history. Perhaps, if the records of some of these alleged ancestors were fully known, there would be an end of the desire to stress this descent too much. After all, what does it matter whether ancestors were saints or sinners, great or insignificant, it is the man of the moment who does things that counts. It is not the past we are living; we live in the present, preparing for the future.

A man is known by the service he performs, not by the title which he assumes. Titles do not beget greater efficiency in employes or increase their value to the corporation by whom they are employed.

"THE rank is but the guinea's stamp, the Man's the gowd for a' that," are words written long ago by a poet who was also a philosopher. Precious metal is not improved in its quality by the impress of the mint, any more than a man is made more useful by giving him a title. On the other hand, a count or a duke may make a very good navvy or sweeper, none the less efficient because he bears a title. In these days of dynastic upheavals some of them are doing such work, and doing it well.

This craze for appearing big by using a title is widespread. A man puts up a shack and collects within it a few groceries. Instead of calling it a grocery store, as his father or grandfather would have done, he calls it a provision company or something of that sort, of which he elects himself the "president." His assistant is the "manager," and the office boy is the "secretary." He gets imposing letterheads printed, and strangers are given the impression that here is a firm of considerable standing. It is not an uncommon thing nowadays for one man to assume the title of "company." He is, of course, the "president" as well as everything else.

These titles, whether military, scholastic, industrial, or professional, exercise a fascination difficult to explain. Even if a man legitimately assumes such designations it shows a lack of good taste to be continually flourishing them in the face of the public. But when he has not the shadow of a right to them the offense is greater.

There are sometimes in the same establishment a number of men performing almost the same kind of work, but who have got the title mania to such an extent that they are jealous of the least infringement of their supposed dignity.

There is a story told of George Washington. It may be as great a myth as that legend of the cherry tree, but it illustrates the point. When in command of the Revolutionary Army Washington was taking a stroll round the camp one day when he came upon a squad of soldiers, under a corporal, who were trying to hoist a heavy beam into position. The general, who was not in uniform, was unknown to the men.

The corporal was shouting orders while the men toiled and sweated at the rope. But it was rather too much for their strength and the beam hung in the air. "Why don't you lend a hand yourself?" said Washington to the petty officer. "Sir, I am a corporal," exclaimed the man indignantly. The general then seized the rope and the beam was soon in position. He turned to the big little man with the words: "Next time you require assistance, send for your commander-in-chief."

Distinctions of title lead to lack of coöperation and detract from efficiency. It does not make a sweeper handle his broom any better because he calls himself a cleansing commissioner, or a gardener more skillful in growing plants if he calls himself a horticulturist. A spade, although a horticultural implement, is first and foremost a spade.

The Still-Hunt

Man, the Panther and the Doe

By MAX BENTLEY

He stood for a contemplative moment.

A FICTIONAL element has been woven into the true account which follows of a hunt for panther by the Reynolds boys and the writer, on the X Ranch in Culberson and Jeff Davis counties of Texas. The movements of the animals prior to the dogs running upon the injured doe have been assumed, and likewise the conclusion of this drama of the lower world has been assumed; but justly assumed.

The character of the doe's wounds, the fact that she was bearing young, and the discovery, several days after the hunt, that her resting place had been discovered and her flesh devoured, suggested the following reconstruction, in fictional form, of an episode that was true, so far as the writer's own connection with it carried.

Dawn was a full hour away when the panther rose from his bed on the ledge halfway up the mountain. The cats are the lightest of sleepers, and through that short summer night the panther's instinct to watch and guard had not been relaxed for an instant, although no creature of the wilderness was safer than he, in the protecting gray-brown blend of the rocks with the gray-brown dusk of his own coat.

After another fashion of his kind he preened himself for the day. Very deliberately he stretched full length. Digging his claws into the shaly surface of the ledge he drew his legs together until his long body, arching beautifully upward, seemed to twang response from rippling muscles and hair-trigger nerves. He yawned prodigiously. There was the luxury of ease in his movements as, with curled paw, he rubbed his whiskers smartly. Then he advanced to the edge of his lair where, with nostrils twitching, he stood for a contemplative moment sounding the cold, thin, wind-washed air.

The light had not commenced to sift through. The black mantle of night still covered the wilderness world, and the depths of the cañon below seemed impenetrably dark; but the panther read their secrets. The pupils of his cold green eyes contracted to a slit, and, under their marvelous focus, the mantle fell apart to reveal every ridge and rock, every flower and fern, that seemed for his purpose to be worth more than a glance.

He saw about him a tumble of ridges and peaks, marking (though he knew it not) the disappearance of the Rocky Mountains on the Western Texas plain. Here and there they were nearly as high as the parent mountains, and clothed in a variety of trees and shrubs showing a curious mingling of the forest growths of East, West, North, and the dry Southwest. Southward, beyond his vision, was an intervening space of flat semi-desert land which he had but lately crossed, inclining in growth to shadeless cacti and other rigidly brittle plant life, with the Sierra Madres of Mexico rising in hazy outline and the Rio Grande curling around their feet.

The panther was a newcomer to the mountain country, and an unwilling visitor. If his wishes had been considered the cañons of the Davis range would not have resounded, the night before, to his half-challenging, half-querulous, calling. His preference was not for the mountain but for the level grassy sward beside living waters, or beneath the shelter of the deep forest. Only his instinct for sanctuary had driven him and his kind from pleasant retreats across the desert into a country of sparse rainfall and insufficient covering. His instinct had not been to migrate, but to flee. Now he was restive, suspicious, unable to adjust himself to the order of his interrupted life.

His toilet accomplished, he leaped from the ledge to a limb of a stately manzanita whose top came level with the floor of his lair, thence lightly to the ground. Soundlessly he made off, following a route of his own—unmarked and yet well recognized from frequent use—leading down the mountain to a spring. His impulse was to eat and drink. He had in mind the carcass of his last victim. Although he had feasted on it for some days there were succulent morsels not too ripe still clinging to the bones which he had dragged to a hollow near the spring and covered with dirt and leaves. A few days earlier the ranch ponies had come to that spring to drink, and among them a mare with a spindly colt at her heels. The panther had hastily sheltered himself in an oak tree; a brief minute's wait and the colt ambled beneath. A leap, a scissor-like rending of soft meat, and the cat's needs were well supplied for a week to come. The slaughter of the colt was the third act of its kind in a month, and it marked the panther himself for destruction at the hands of the Reynolds boys, owners of the ranch. Indeed, he had been unsuccessfully hunted for a week, up and down the cañon, and even now another hunt was forming at the ranch house some five miles away.

His route to the spring led past a sentinel elm guarding a wildwood tangle from which, yesterday, after a moveless wait of hours, he had catapulted himself upon a passing doe and then lost her through the untimely appearance of Will Reynolds' red hounds. The panther had barely saved himself. Hurling himself backward in a lightning bound he had gained his ambush and thence jumped to a ledge

safely above the dogs, from which—screeching and spitting and fanning the air with aimless sweeps of his claws—he had defied the calls for help. He might have torn them to ribbons, but his was the inherited cowardice of the felines which alone denied him kingship of the wilds. Although a determined and fearless hunter his veins ran water before the pursuit of man or dog. Once hemmed by them, he would have died miserably without a fight.

Passing the scene of yesterday's encounter with the doe, he stopped suddenly as the memory of it smote him. The hair rose along his back, his long tail twitched, and he shrank against a juniper bush while his nose made an appraisal of the place. His nervousness increased as he picked up the deer scent still clinging faintly in the tops of the short dewy grass. Abandoning the impulse to eat and drink at the spring he turned upward again, and by a new route cautiously returned to the safety of his ledge.

In that inky blackness only an eye trained to the wilderness might have singled the hiding doe. Not the faintest movement revealed her—no fatal glint in the soft brown eyes such as betrays the hiding places of cats. Her breathing was as light as the air itself, and her flanks rose and fell with a motion all but indistinguishable. Yesterday fear had dwelt in her eyes; today they were soft and questioning.

She was desperately hurt, but the agony of her fright had passed. She had no recollection of yesterday's peril; of the paralyzing shock of the panther's attack which had borne her down and defeated her mad attempts to rise; of the wild screeching accompanying the attack; of the air filled with raking claws that had sent blood spurting from her sides; of the sudden clamor of dogs at hand; of her own flight. She had run blindly, with loud blowings and an ungovernable terror in her heart. The dogs, had they not been diverted from pursuit by the cat, would have run her down quickly, for she carried a mangled hindquarter.

What had happened yesterday had passed from the doe's memory. There remained a bearing down within her—a living weight whose heartbeats kept time with her own. Only that and an awareness of thirst burning her throat not to assuage which, something told her, meant a lingering death to her and hers.

Though it was autumn, the brown doe was near her time. In a land such as is Texas, where the mourning dove goes mating in September, where the bear does not hibernate, it is not uncommon for the wild quadrupeds to bear young either in midsummer or midwinter. More than any other cause, a contrary climate will turn topsy-turvy the usually regular processes of nature.

Resting quietly in her shelter, the doe took note of the passage of the night. A sleepy chirrup overhead was followed by a flutter of wings as a flock of sparrows accommodated their tiny bodies to a wandering wind puff. A hawk took wing nearby and sailed heavily away. Along the path came a cottontail—another alien in the hills—hopping in leisurely fashion. The doe sensed the coming of morning. Her impulse was to rise, and she obeyed it. She came to her feet with an effort, stood for a moment on trembling legs, and presently moved off down the mountain, toward the spring.

The hunters, in two automobiles, turned off the main ranch road. With lights out they coasted down the hillside through the spectral darkness to the corral where waited the ponies. Will Reynolds, master of the hunt, took that precaution because (as he explained with a sly smile), to arrive noisily might alarm the ponies, and they, unused to lights, might bolt through the high but none-too-secure corral fence. They never had, but they might, and they were always threatening.

The mountain pony is the most phlegmatic of creatures. He steps into dangerous trails with a nonchalance that has been bred in him down a long line of trail-developed ancestors. He proves his trustworthiness in a hundred thrilling emergencies, but at the same time reserves the traditional privilege of a burst of temperament now and then, especially on being approached unexpectedly and at unseasonable hours. He is altogether harmless at such times,

Only an eye trained to the wilderness might have singled the hiding doe.

he is content to occupy the stage but briefly, and the master who indulges him has come to learn something of the horseflesh complex.

Roping the mounts that morning amounted to a rite. The Reynolds brothers, Will and Nathan, entered the corral. The next instant the air was full of whistling lariats, fast-revolving bodies, dust clouds and snorts. Peaceful Henry, for eighteen years a trusted saddle pony on that ranch, led the herd of equine prima donnas. Round and round the corral he dashed, snorting, bucking, with mane flying and tail stiffly behind him, dodging the ropes with a *sang froid* born of long experience. The footmen patiently followed him until, presently, a noose slid along Peaceful Henry's back. It was in nowise a catch, but honor was satisfied. The pony plowed to a stop with forefeet braced, tamely submitted to bridle and blanket and saddle, and, head down, followed his master to the gate. The other fugitives managed to get themselves caught, too, but without seeming to be surrendering too precipitately.

Single-file the party entered the head of the cañon. Will Reynolds led while Nathan, afoot, acted as trail finder and dog tender. The two hounds strained on their leashes, Little Red being inclined to advertise his youth and inexperience in a series of short and muffled barks, and subsiding to rebellious whines only under the fierce half-whispers of his master.

Light was now indistinctly breaking over the mountain. A saffron glow came faintly through the hanging mist, seeming to stain the air in transparent pink and orange tints. To unaccustomed ears not a sound arose to mar the solitude, yet the cañon thronged with life stirring to the day. The wild things of Nature only seemed to be sleeping—the progress of the hunters, cautious though they tried to make it, was spied on from bush and bough and bend, and word of their going preceded them.

Panther Spring the Only Waterhole

Panther Spring was the only waterhole in the cañon. Thither Will Reynolds was leading the way, but not a direct way. Though a seasoned hunter, putting proud store by his collection of mounted deer horns, he had that half-unintelligible but sincere love for the helpless folk that peopled the wilderness thereabout, and he chose a wandering route over steeply mounting trails, the recompense for whose rough going was, for him, the variety of fresh sights to be seen in the coming day; fleeting glimpses of the smaller four-footed things stealing from cover to cover and deeming themselves to be hunted; dewdrops glistening on the ends of piñon and juniper and cedar needles like pendants of jewels, and the feel of the fog on face and hands.

Thus, by a roundabout route, the hunters at length came to the top of the ridge at about the same time that the panther leaped from the manzanita to the safety of his rocky lair and the wounded doe responded to the burning in her throat by beginning her labored descent to the waterhole.

The Flight of the Sonora Doves

On the instant of their arrival, so nearly it seemed to be timed, the fog definitely broke. The curtain rolled away to reveal a dripping-wet concourse of trees over whose tops, rising and dipping and sounding their sweetly sad notes, volleyed a little flock of band-tailed Sonora doves. They were of a genus closely akin to the passenger pigeon which once shadowed the earth with his migration as he passed, in stupendous numbers, across the heavens in spring and autumn, and their tender calling—*koo-eet, koo-eet*—seemed to bear something of the lament of that vanished other species.

It was Big Red that picked up the trail. The dogs had been released on the mountain top and had sped away, casting about in ever-widening circles. Little Red announced himself noisily as usual, but Big Red made a beautiful picture as, with nose down and body extended, he hunted relentlessly and without voice. But finally, far down the mountain, came the singing deep-toned notes that brought the hunters clattering forth. It meant panther.

From now on it was hard and fast work. The hunters arrived before a tangle of juniper and oak and trumpet vine tendrils to find both dogs dashing in and out in a state of frenzy, so hot was the scent. Their frantic circles invariably ended at the foot of a sentinel elm into which the big dog was attempting to leap.

Nathan rushed in plying his quirt.

"Nothing here!" he shouted. "Go on, go on!"

Little Red picked up a trail and followed it madly down the mountain. The hunters did not see the dogs overrun the doe, but her labored flight and the catch were in plain view. Little Red made a clumsy stab at her trailing hindquarter, while Big Red leaped straight for the throat. She fell to her knees.

"It's a doe!" Will Reynolds called. He flung himself from his horse. A dozen leaps brought him to the struggle. A hasty kick sent Little Red yelping away, but to cool the big dog's ardor required sterner measures with the quirt. The dogs retreated, then returned to throw themselves at the hunters' feet, tongues dripping and eyes full of wonder. The flight of the doe died away to a faint crashing.

"That doe is hurt," said Will Reynolds. "We'll take her alive."

And so the pursuit was renewed. The hounds were again leashed and the party divided, Nathan and the dogs following the trail downward and Will and the main party taking a straight line. After a time came Will's voice, faintly, from around a shoulder in the cañon.

"I've got her!"

The fugitive had blundered into a trap—in trembling silhouette for all to see she stood on a dizzy brink of a ledge from which there was no escape save to plunge to death on the rocks thirty feet below. Will Reynolds lassoed her, cautiously drew her forward, then tripped her with an expert flirt of the rope. She fell heavily, and lay with heaving flanks, but turning her head from side to side in utter helplessness as her captors clambered down to release the noose.

Her day was plainly done. Besides the torn hindquarter there were cruel gashes along her body—the light brown of her coat was stained deep black. Will Reynolds bent down to examine her more closely.

"The panther got her. And *that's* not all," he said, startled. "There's a fawn, too. We'll have to kill her, boys."

When Tragedy Came to the Doe

Although to slay a doe at any season is an illegal act, dispatching this stricken creature was an act of simple mercy. Will Reynolds called for his rifle. The doe staggered to her feet.

The roar of the gun echoed from crag to crag. Anxiety, and questioning, faded forever from the deep brown eyes as the doe toppled stiffly from the ledge and crashed through the branches of a stately manzanita to the rocks below. The hunters covered the body with boughs and twigs and grass, and soberly departed. The day's sport was ruined.

As the timid wild things emerged from their coverts to resume their simple occupations, there was a stirring just above the ledge. A lean form appeared from a shelter of rocks and bushes—and the panther looked down upon the scene. He had seen it all, with tense body and softly lashing tail. The fierce light in his eyes was not of gratitude, but of hunger—it was no concern of his that the doe had been brought straight to his lair, that a bounty of sweet meat, only yesterday denied his own prowess, had been so suddenly laid before him by that most implacable of all his enemies, man. After a prudent wait he alighted upon the ledge, and then slipped nimbly down the face of the cliff to his feast. One contemptuous sweep of his paw, and the doe's frail covering was scattered to the winds.

The great crouching beast looked up challengingly. Far overhead, in the tide of the mid-morning heat, floated a vagrant pair of hawks. A blot down the cañon was the departing hunters and the dogs trailing listlessly behind. As the quietude closed down the panther sank his fangs into unresisting flesh.

Rain Is the Great Benefactor

An Element Without Which the Earth Would Be a Barren Desert

HARRIET GEITHMANN

IN ATHENS, in days of old, many an earnest prayer was offered up to Zeus: "Rain, rain, O dear Zeus, down on the plowed fields of the Athenians and on the plains."

In China, in days of old, when the Celestial Empire was at its height of glory, the august Emperor in behalf of his 400,000,000 children journeyed out to the Altar of Heaven, that magnificent marble tabernacle of Pekin, and offered up his august prayers to the benign gods of sun and rain and snow. In America, on Thanksgiving Day, the President of these United States offers up a prayer of thanksgiving to the Father of Light for a bountiful harvest, the gift of sun and rain and snow.

Rain, rain the benefactor, gentle, life-giving, rejuvenating rain of springtime, the tempestuous rain of summer, the refreshing rain of autumn and the deliberate rain of winter, thou art acknowledged to be the Eve of all physical life on the smiling face of the earth. "Sunshine is delicious; rain is refreshing; wind braces up; snow is exhilarating," said John Ruskin. "There is really no such thing as bad weather, only different kinds of good weather."

When the Clouds March Across the Sky

Go to Hawaii for liquid sunshine, a fine mist of rain shot through and through with golden sunlight, one of the joys of the Hawaiian climate. Go South or East for torrential showers drenching the earth with vehement energy and go to the Northwest for all varieties of rain, the benefactor. "The Sound region," said John Muir, "has a fine, fresh, clean climate well washed both winter and summer with copious rains and swept with winds and clouds that come from the mountains and the sea." One can have almost any kind of weather he chooses in any bonnie corner of Uncle Sam's 3,000,000 square miles of territory. Almost the entire country revels in rain and snow one-third of the year.

The majority of us have a blind way of taking our blessings for granted and among the greatest of these is rain. When the clouds march across the sky we gasp: "Is it going to rain?" and we dash out with our umbrellas fearful of trifling consequences and unmindful of dusty roads, parched fields, thirsty trees and plants, pleading farmers and weary travelers. We appreciate rain a thousandfold more after experiencing a drought, when the sky turns yellow, the rivers run dry to the sea, the streams shrink into nothing, the "sun sucks the earth's blood like a vampire," the ground under one's feet turns to dust and is slippery as an eel, the parched grass and trees shrivel up and turn white, the fields, no longer fertile, are desert-dry, the smoke from forest fires obscures the vision and the air scorches one's cheek morning, noon and night like the breath of a furnace. 'Tis then that one appreciates the first soft and delicious raindrops full of hope and promise for the future. They are music to the ear, heavenly perfume for the nostrils, joy to the eye, warm, life-giving, "sun-distilled, far-traveling, vapor-born" raindrops, healing, cleansing the air and the earth, refreshing humanity, sponging off leaves of grass, one's rose bushes, as well as Walt Whitman's "slumbering and liquid trees," the mighty cedars and giant firs. Trees are like sponges waiting to be divinely filled.

It is estimated that the whole earth would be covered with a blanket of snow twenty inches thick if all the water vapor floating about in the atmosphere were precipitated in the form of snow. Rain is the product of an ordinary cumulus cloud carried to a certain point of saturation, the condensed vapor of the atmosphere falling to the earth in drops, any one of which would be "as dangerous as a bullet," were it not for the resistance of the air. As the drifting, drenching clouds leave their breeding heights in the West and the Southwest,

All the Thirsty Throats of the Fields

they march forward to their destiny constantly recruiting young and lusty clouds from the atmosphere as they advance.

The earth never smiles with the same gladness or purrs with the same satisfaction when one uses the garden hose or the sprinkling can. All the mysterious "skyey influences," the happy benefaction, the electrical energy, the ozone and the ammonia are absent in such a sprinkling process. But let the dull gray clouds do the sprinkling and the earth opens up her pores that she may drink deeply of the bounty of Nature. All the thirsty throats of all the fields are eager to be quenched and all the tree toads and insects slide out to "wet their jackets." The gentle vernal showers with their quickening spirit, the gift of warm, tropical vapors, charged with the essence of spring, greens the grass, makes robins hark more intently for stirring worms and insects, and coaxes all Nature to don her loveliest frock and her winsome smile for the coming carnival. The spring rain is impulsive and capricious with many a jolly surprise up its sleeve, a dashing spur to action one minute and a leisurely pitter-patter, gentle as the quality of mercy, the next minute. No American poet has more ably expressed the joy of a spring shower than Robert Loveman in his "April Rain":

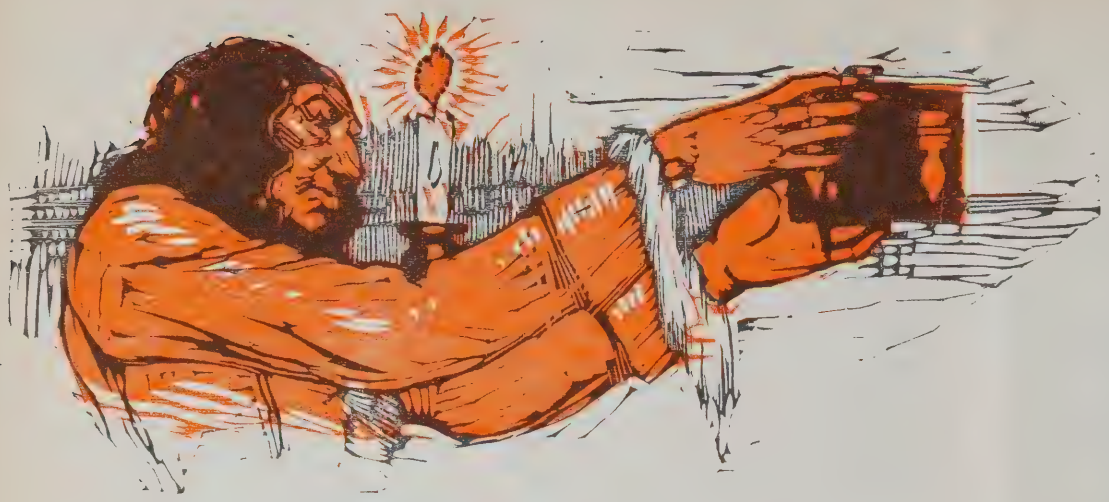
It is not raining rain for me,
It's raining daffodils;
In every dimpled drop I see
Wild flowers on the hills.
The clouds of gray engulf the day
And overwhelm the town;
It is not raining rain to me,
It's raining roses down.
It is not raining rain for me,
But fields of clover bloom,
Where any buccaneering bee
Can find a bed and room.
A health unto the happy,
A fig for him who frets!
It is not raining rain to me,
It's raining violets.

Rain as Necessary to Man as to Vegetation

The health of men and women and little children depends upon the life-giving, rejuvenating rain that causes the water to flow under the bridges the year round in the Pacific Northwest. It brings sweet relaxation, relieves intense action, eases taut muscles and tired nerves. A gentle gray sky is full of soothing influences and a good rain delivers those happy influences at the front door of humanity. The tension of all Nature relaxes. "Seven-tenths of man himself is water," said John Burroughs. "Seven-tenths of the human race rained down but yesterday. It is much more probable that Alexander will flow out of a bunghole than that any part of his remains will ever stop one. Our life is indeed a vapor, a breath, a little moisture condensed upon the pane." Rain is just as necessary to the mind of man as it is to vegetation.

What one among us does not cherish the weather saws and revel now and then in signs of the weather? If the smoke clings to the ground, noises become loud, windows and doors stick, the leaves of plants begin to freshen, the leaves of books begin to stick together, odors grow stronger, stones begin to sweat, fiddlestrings lengthen, swallows fly low, sheep lie around in the pasture and refuse to nibble, hogs grow restless and grunt, roosters flap their wings, hens flutter in the dust, bees cling to their hives, 'tis well to keep a weathered eye out for rain, the benefactor.

Even in the inspired Psalms of the Bible, the weather received honorable mention: "He causeth the vapors to ascend from the ends of the earth; He maketh lightnings for the rain; He bringeth the wind to come out of His treasuries."



Romantic Rascals—No. 3

The Count of St. Germain

By CHARLES J. FINGER

Author of "Highwaymen," "In Lawless Lands," "Bushrangers," "Tales From Silver Lands," etc.

Wood blocks cut by Paul Honoré

(Copyright, 1925, by Charles J. Finger)

NEARLY thirty years before George Washington was born, when Anne was England's queen and Louis XIV reigned in France, there was a Portuguese Jew who left his country and settled in Bordeaux, turning a couple of rooms in a dark and narrow street into a money exchange, and lending money at an astonishing rate of interest. In time a son was born to him, but what name was given to the child, or on what date he was born is not known, nor perhaps does it very much matter. What is important to know is that the child grew to be a sharp-witted boy, one full of low cunning, eager to hear and to read, one forever putting questions, and, above all, an inordinate and picturesque liar.

When the lad was nearly twelve years of age, the money mart in Bordeaux experienced a sudden activity due to the drifting into town of certain sailors, deserters from the Spanish ships destroyed by Admiral Byng in the Faro of Messina, and they brought with them treasure of which they could give no very straight account and so were willing to part with on easy terms. Seeing all that, the heart of the boy was aflame with desire, so one night he emptied his father's cash box, pocketed the proceeds and set off for Paris, where dukes, countesses and marquises rubbed shoulders with peasants and chimney sweeps in the narrow Rue de Quincampoix to buy and sell stock. For they were days of financial fever of a dangerous kind, days when, as it seemed, everyone in France might become rich without working, for the Scot, John Law, controller-general, had set everyone mad with his Mississippi Scheme, and the fabric of false credit and inflated money was tottering to a fall. And it seemed to the young financier that it would go hard with him did he find no means to make money when a mere cobbler could, and did, rent his stall for two hundred livres a day to a broker, or when a man could, and did, make a pretty penny by walking the streets with a board on his back, intended for use as a desk. Nor was the young Jew disappointed, for in Paris there were messages to carry, dishonest jobbers to serve, and many little secret commissions to execute for wealthy and careless folk who exercised no rigid or jealous scrutiny. And out of his many experiences grew a belief, daily strengthened and confirmed, that a rich harvest awaited the man who was not afraid to be *menteur a triple etage*, with a credulous and weak-minded public as audience.

One way and another, by pinching and fleecing, by squeezing those in low water and pressing others with a beggarly account of empty boxes, with now and then a doubtful adventure among those who handled base coin and flash notes, the young Jew climbed the financial ladder, until, having attained years, and a manner of easy assurance, he took his place in society as a pawnbroker.

Into his shop one day walked a man with a nervous, intelligent face; one, as it presently transpired, who had but recently been released from the Bastile, and he offered for sale a diamond ring. At once, with curious zeal, the young Jew started to assure his customer that he was altogether mistaken as to its value and that the seemingly precious stone was nothing more than a piece of glass, though, to be sure, he admitted, cleverly manipulated. But when the ex-prisoner found an opening at last to say something, he considerably astonished the pawnbroker by revealing a wealth of knowledge about diamonds, and it came out then that he was a lapidary by trade. So the money-lender cast aside primary impressions and disposed himself to question and to listen, his natural avarice prompting him to grasp the ideas as well as the gold and possessions of others.

What followed is a matter of history. Seated at a little table in the far corner of a wine shop, and being encouraged by cordials and dexterously questioned, the old lapidary told a strange tale of his acquaintance with Sieur Delisle, a fellow prisoner who had been allowed to escape, though as it turned out, the whole affair was nothing more than a trap cleverly set, for no sooner was he on his way than concealed guards shot at him, and, being helpless, his body was searched for the famous philosopher's stone.

At that the pawnbroker interrupted the tale. "Philosopher's stone, you say! What manner of stone is that? I know none of that name." There was a kind of avidity in his manner that did not escape the lapidary.

"It is not what one would call a precious jewel," the old man said. "Nor have I, to my certain knowledge, ever clapped eyes on one. Indeed, whether it be stone, or powder, I know not, but with it, it is said, lead may be turned to gold. Few know the secret. A man here, another there. Many's the time I have heard Sieur Delisle give the names of some. A certain Dr. Dee there was. And Pope John XXII. And Roger Bacon. And Alfarabi the Arabian."

The pawnbroker looked at the lapidary with immense eagerness. His eyes glittered like those of a dog seeing meat. Then he tried to assume an air of unconcern, though without much success. "Doubtless some trick," he said. His mask was transparent and the lapidary saw the dominant anxiety, for more than once he had seen the same light of greed in the eyes of men who had sought to question Delisle in the prison.

"As to that, I think that the gold was all that gold should be," answered the old prisoner. "Indeed, the good Bishop of Senés with his own hand wrote to King Louis that the genuineness of the gold could not be doubted and jewelers of Lyons and of Aix and of Paris testified in its favor."

Now the young Jew was a rogue rather than a fool, except you take it

that all rogues are fools, so he put other questions dexterously, and at last made his own all the queer occultism that had been the delusion of Delisle and it became clear, presently, that the old lapidary had swallowed the most incredible inanities and preposterous delusions about transmutation of metals, universal medicines, elixirs of life and all kinds of odd conceits. But for the pawnbroker there were other visions, and for the next twenty-four hours his mind was full of ideas of new worlds open for exploitation. It was no new notion to him that a rich harvest awaited the man who lied hard enough and long enough to a sensation-seeking public. He had learned that in Paris easily enough. So what could not be done by persistent advertising of the right kind in a gullible world? Could not life waters still be sold? Were there not old men who would part with gold and silver for the promise of rejuvenescence?

Thereafter, the young pawnbroker became a close reader of strange old books. By diligent searching he found out a certain Albert Aluys, the same who had once persuaded the Duke of Richelieu into a belief in his powers as alchemist, and he installed Aluys in his apartments. There was a period then of mystery, of goings and comings, of lights burning through the night, and at the end, the pawnbrokerage business was abandoned, the shop sold, Aluys disappeared from the sight of men and the young Jew left Paris, apparently having business of most urgent nature that called him elsewhere.

Shortly after, there appeared in Germany a strange man who was sometimes dressed in oriental costume, at other times in a sober brown cloak, a brown doublet, a lace collar and a plain hat, like a decent and respectable citizen. He was a man dignified in his bearing, very silent, with an air of great mystery about him. Presently it became known, through what seemed to be the indiscreet talk of his manservant, that he was a philosopher from the Far East. Then it was told about that he spoke every known language. Some said that he was the Wandering Jew. Others held to the belief that he was the son of an Arabian princess, and his Jewish cast of countenance tended to favor both theories. There were reports that he had the strange power of drawing pearls from the sea by his incantations. It was told, and believed, that he could interpret dreams. He was said to be skilled in Katoxtromancy or the art of divination by means of looking-glasses. More wonderful still, while he had the appearance of a man of thirty-five or so, his real age was probably more than five hundred years and he referred, in his conversation, to historical personages long since dead whom he had met. It seemed obvious that such a wonderful fellow must be under the protection of the seven planets, so many great doors were opened to him and his fame grew speedily and reached far, especially when it became known that he sometimes dispensed the water of life, by which old men swiftly grew younger. That story spread like wildfire, not only over Germany, but to France, to Paris, to Italy, and of all in the world who were anxious to see the philosopher, none was more keen than the powerful Maréchal de Belle-Isle.

"The gold was all that gold should be," said the old ex-prisoner.

And the desired meeting came soon. For one afternoon the Maréchal was in ill humor, weary and drowsy, tired of the country, tired of his neighbors, tired of hills and gardens and woods, and even tired of himself. All day the skies had been heavy gray, the hills a smoky purple, and the occasional gusts of wind came from such direction that great volumes of pungent smoke billowed out of the chimney and into the room. Then it began to rain, first a drizzle, later a steady downpour. To make matters worse the roads were well-nigh impassable so that he could not venture out, as he had intended, to play lansquenet with his crony, M. Arnauld. So the Maréchal faced an unhappy evening with himself and stood at the window, a melancholy man, finding nothing better to do than to drum on the glass with his finger tips and watch the raindrops course down the pane. Tiring of that, his eyes wandered to the garden, then beyond, resting idly to mark the rivulets and water pools in the road; then, suddenly, hope came. For at the very moment when one of his footmen lit the candles, he caught sight of a dark speck moving between two clumps of trees, and a concentrated look revealed it as a coach, but not the coach of M. Arnauld, who never traveled with four horses. Something else most strange he saw. For it seemed that in the coach were spots of light which at first he took to be a reflection on the wet coach body. But soon he marked the steadiness of the lights and the number of them. So Maréchal de Belle-Isle bade his servants make preparation for a guest, even though a stranger, then betook himself to his blue room, a place of gilt, and silver vases, and mirrors, and brightly shining ewers, and many dainty wonders, where he arranged himself in the rôle of contented country gentleman in epicurian ease, a copy of "Les Fables de La Fontaine" on a table at his elbow, a blaze of candles illuminating a sunlit landscape of Claude Lorraine that hung on the wall. Yet, for all his elaborate preparation, there was a sidelong glance through the window to see the fine gilt coach illuminated by candles in lanterns draw up at *(Continued on page 29)*

Greely Survivor's Story of Heroism

Says "Shenandoah" Might Succeed in Reaching Pole—An Arctic Epic

By S. R. WINTERS

"TODAY, there is no reason why the *Shenandoah*, famed dirigible of the United States Navy, should not make a flight to the North Pole without the slightest difficulty. From my knowledge of the Arctic region in the summer, an air voyage from Nome, Alaska, to the North Pole and return would be 50 per cent less hazardous than the voyage from New York to San Francisco by aircraft. However, the reaching of the North Pole should not be the object of such a trip but rather the purpose should be the exploration of the large, unknown area surrounding the highest point of the globe."

These words assume unusual significance because they were uttered by Brigadier General David L. Brainard, who for fourteen years maintained the record of having attained the point "farthest north," and is one of the two survivors of the famous Greely expedition of 1881 to 1884. Then, invasions of the polar regions were attended by great hazards and the announcements of such expeditions occasioned world-wide interest. Today, explorations of unknown lands are frequent and human life in taking these ventures is not jeopardized so greatly as in former days. Improved modes of travel, radio communication for keeping in touch with civilization, and better ways for transporting food and clothing have lessened the risks and hardships of adventure.

The ill-fated expedition made by Major General A. W. Greely, 43 years ago, for the purpose of making scientific observations, is an outstanding example of how a band of twenty-five explorers experienced indescribable horrors of starvation and cold that the spirit of discovery and venture might assert itself. This heroism also typifies the fortitude of the old school of army officers. Only seven of the original twenty-five members of this expedition survived, and today there are only two persons living to tell this tale of heroism. Brigadier General Brainard, whose address is the Army and Navy Club, Washington, D. C., in an exclusive interview for THE DEARBORN INDEPENDENT, enables this writer to present a first-hand description of the sacrifices of this expedition in search of knowledge of climatic conditions and information about unknown lands. General Brainard was one of three members of the party that traveled within 400 miles of the North Pole, the most northerly point at that time.

"The expedition was organized in 1880-1881," said General Brainard in beginning his thrilling account, "and was commanded by Lieutenant A. W. Greely (now Major General). We went north in July, 1881, with St. Johns, Newfoundland, as our final starting point. Upon the morning of departure we received advices from the Chief Signal Officer of the War Department, at Washington, that President James A. Garfield, who had been

BRIG. GEN. DAVID L. BRAINARD

assassinated, would live. Another report, which was received three years later, told of his death.

"We reached the place selected for winter quarters in Lady Franklin Bay, Grinnell Land, latitude 81 degrees 44 minutes, about the middle of August. The house in which we were to take abode was built in sections, a departure in those days. This structure was 60 feet long by 22 feet wide. It consisted of double walls, doors and windows, and had a lining of tar paper. It was considered a comfortable habitation for the winter of 1881 and the succeeding year.

"This house was named Fort Conger, in honor of Senator Conger of Michigan, who was largely responsible for enactment of a Congressional bill providing an appropriation of $25,000 for the expedition. This legislation specified that these funds were to be used for scientific observations and for explorations. Fort Conger was one of fourteen stations planned to be established by an Arctic Congress of Nations within the Arctic Circle. Greenwich time had then been adopted that these scientific observations could be made simultaneously, an obvious advantage in formulating laws pertaining to meteorology or weather conditions.

"Members of this expedition were engaged, during the winter of 1881, in establishing provision depots along the coast for conducting explorations the next spring. Sledges were also built and other equipment necessary for field service was constructed. The vessel *Proteus*, which brought the party to Lady Franklin Bay, returned to St. Johns, Newfoundland. Consequently, the only means of conveyance for leaving the Arctic regions were sledges and small boats.

"In the spring of 1881, our house was established on Lady Franklin Bay, Grinnell Land, an area named in honor of Henry Grinnell, who had financed two previous polar expeditions. We crossed from Grinnell Land to Greenland and early in the spring explored 100 miles of the Greenland coast. This was north of the highest point previously attained. Lieutenant Lockwood and myself, together with the Eskimo dog driver, made a journey to within 400 miles or less of the North Pole. This shattered the record which England had established and maintained for nearly three centuries.

"Frequently, I have been requested to write my impressions of when I attained the most northerly point known in those days. Of course, we sensed a feeling of satisfaction but we were too cold and hungry to permit of enjoyable thrills. Rations were nearly exhausted and we loathed the idea of eating dog meat. Consequently, one of the dogs was killed and its carcass fed to the other dogs, thus releasing additional food for human consumption. It was a coarse kind of pemmican and moldy—certainly not palatable." (I asked General Brainard if the party ate any dog meat when in the throes of starvation. He replied to the contrary, but stated that they had left the dogs behind and dog meat was not available when the pangs of hunger were gnawing their very lives.)

"The second year we attempted to reach a point even farther north," stated General Brainard, "but were turned back by open water and the party returned to the station at Fort Conger. However, not wishing to abandon the exploration, Lieutenant Greely sent Lieutenant Lockwood and myself to cross Grinnell Land. We reached a fiord which we named in honor of Lieutenant Greely, and also discovered on this trip that the summit of Grinnell Land was covered by an immense ice cap and that the water which flowed down from all sides into the valleys formed glaciers.

"During that year orders were issued that if no vessel reached us by the first of September the party should retreat along the coast to Littleton Island, 300 miles south of Fort Conger.

No vessel having come to our rescue by August 12, 1883, the explorers embarked on small boats, leaving sledges and dogs behind. We suffered great hardships, ultimately drifting into Buchanan Bay and made our way on ice floes to shore. Jens and Rice, the Eskimos with the party, were detailed overland to Cape Sabine where they received the news that the vessel *Proteus* had been crushed in the ice. This vessel, on which we had embarked on the expedition, had started as a relief ship in 1882. The crew, escaping from the ice floes that wrecked the *Proteus*, retreated to Upernivik, the most northerly Danish colony on the western coast of Grinnell Land. This ship also carried our mail, which was lost.

"The party then moved to the coast near Cape Sabine. Here a makeshift hut was constructed for use during the winter. It was 22 feet long by 18 feet wide, with walls of stone about four feet high, and with an improvised roof made by diverting our boat to this purpose. The oars served as rafters when placed from the edges of the boat to the edges of the wall, and the sails were spread over these rafters to complete the roof. Drifting snow almost hermetically sealed the party within this shelter.

"Forty days' provisions remained for the twenty-five men. Rations were curtailed to thirteen ounces daily and later this allowance was reduced to eight ounces. However, inhabitants of Arctic regions require three times as much food as persons living in temperate zones. Thus, curtailed rations meant great suffering. In fact, I do not know that there is any greater physical suffering in the world than that experienced in the early stages of starvation when the food available is barely sufficient to prolong rather than sustain life. The first death of this party from starvation occurred on January 18, 1885, and then deaths from this cause periodically took place until the rescuing crew arrived on June 22. Then only seven persons remained alive.

"During this period of the so-called 'starvation camp' we actually devoured sealskin clothing, boats and sleeping bags. Shrimps, designated by whale fishers as sea lice, were caught, and these minute things were stewed with the sealskin. It required 200 of them to weigh one ounce. By means of rakes made of barrel hoops, the ocean was raked for kelp and other forms of marine vegetation. This was used in making stews. During that winter several foxes were killed; in the spring a few birds were captured, and a bear and two or three seals were killed. This augmented the scanty food supply and it appeared that the then twelve remaining members of the party would survive. However, the principal hunter, Eskimo Jens, was drowned and thus there was little likelihood of obtaining any more seals. Other members of the crew were too weak to hunt.

"The other Eskimo had died in March, a month before Jens drowned. They were faithful to us to the last, doing what they were told to do, but at the same time having no conception of what it was all about. Jens, who was devoted to Sergeant Long, had refused to turn back in his narrow boat of skin some little while previous to his death, when Sergeant Long, adrift on an ice floe which had broken away, had been threatened with death.

" 'No,' he shouted to Long, who had told him to go back, 'I am your friend and if you go, I go too.' When the fatal accident befell the Eskimo, Sergeant Long was unable to reach him, and Jens, whose boat was thought to have been punctured on the ice, went down to a watery grave without an outcry. The supposition is that he made no sound for fear that Sergeant Long would attempt to rescue him, which effort would have been futile.

"The deaths of the members of the party were due to starvation with the single exception of Private Charles B. Henry, whose real name was Charles Henry Buck. He was executed for stealing rations. His thefts were first discovered one night when the cooks forgot to open the ventilator and we were nearly asphyxiated from fumes of the alcohol lamp. In the confusion, Henry had bolted three pounds of bacon, but the weakened condition of his stomach made it impossible for him to retain the meat. He was thus detected. Some of the men wanted to kill him then, but Lieutenant Greely ordered him made prisoner. No one spoke to him from that time on. Later after being put on parole, he began stealing again. Then Lieutenant Greely ordered that if he was caught again he must be executed. He was detected in the act of stealing the very next day.

"Sergeant Long, Sergeant Frederick and myself were the three selected to perform the duty of executioners, perhaps because we were the strongest. The original plans contemplated that a fourth man should load two of our guns with blank cartridges and the third gun with one ball. But all of our guns were of different caliber, which meant that the fourth person would know who was the executioner. No one of the three wanted to be classified as the executioner. Consequently, it was decided that one of the three should take the heaviest rifle, a Remington .45, and perform the execution, swearing the other two men to secrecy. This was done. The other two of the trio are dead, but I know that they never told. I shall never tell." I asked General Brainard what disposition was made of the body and he stated that it was cast into the sea.

The Greeley Expedition, 1881.

"During that winter of starvation," continued General Brainard, "we talked often of food. In fact, the discussion of imaginary menus constituted the major portion of our conversation. At that time Harvey's Restaurant, at Eleventh street and Pennsylvania avenue, Washington, D. C., was at its height of popularity. It was Harvey, I believe, who originated the idea of steaming oysters, and we would imagine that we were at this restaurant ordering this or that food for breakfast. A poor fellow would go over a great number of items of food, quite unconscious that in the aggregate it amounted to enough to feed ten men. Of course, we could hardly set a limit to the amount of food that we fancied would satisfy our appetites. Lieutenant Lockwood, I remember, entered in his journal that when he returned to Washington he had invited me to have certain dishes with him. When I did return—with Lieutenant Lockwood remaining behind, because he died in March, 1884—his father, General Lockwood, frequently served me with dishes referred to in the journal of his son.

"I forgot to mention that when the crew of the ice-wrecked *Proteus* retreated southward, they left on shore a small amount of food supplies. This was called a 'wreck cache'; things that they could not take with

Youth Helps to Save Our Forests

Many Thousands of Trees Planted by American Boys and Girls

By JAMES CLYDE GILBERT

WITHIN reach of great lumber-using centers like Pittsburgh, Detroit, and Chicago there are millions of acres of land which are producing nothing and which are of no use except for raising trees. The distance of our remaining forests from centers of population, such as the cities named, is what boosts prices through costs of transportation. Dwellers in the cities should know this and realize that the remedy lies in training the youth of the nation to conserve what forests we now have and to create more by planting.

Wild life cannot exist where the scorching rays of the summer sun burns the vegetation or where the fierce blasts of winter sweep over the waste spaces unchecked. The older generation of Americans devastated our forest lands and the damage must be repaired by the younger generation—the boys and girls of today.

Moosalamoo Lodge and two sleeping cabins built by the boys in area thinned out by them at Keewaydin Camp.

Unheralded and unsung there has been sown a seed that, if carefully nurtured and sustained, will grow into influence for good that will be far-reaching in its effects. I refer to the interest the Girl Scouts of America are taking in the reforestation of our waste places. When 497,000 determined young women take it into their heads to do something there is going to be something done.

To begin with, Mrs. Jane Deeter Rippin, the national director of the Girl Scouts of America, with a troop of Girl Scout assistants, planted thousands of tree seedlings over an old dump at Andree, the national Girl Scout camp at Briarcliff Manor, New York. It has been a back-breaking job, this business of uprooting the tin cans and other debris, but ten years hence Girl Scout Christmas trees will be selling in New York City, and fifty years hence there will be an upstanding forest of thousands of white and red pine, spruce and balsam trees to add to our country's dwindling timber supply.

It is not so much what is being done at Camp Andree—though that should receive every commendation—as it is the splendid example the troop there has set for the other troops throughout America. This is merely the beginning of a reforestation movement whereby the half-million Girl Scouts will help check the devastation of the nation's recreation grounds. It is also a patriotic duty, for in time of war the best timber is at once "drafted" for various uses. During the World War Great Britain depended on her own forests to a large extent for war needs, and the cream of the country's trees was garnered at that time. She did not forget the lesson, and is today rapidly planting vast areas to seedlings as a means of national defense.

It is not a matter of timber supply alone; but trees protect the land from erosion and hold vast quantities of water in storage, like a sponge, after rain and snow fall. Few persons realize that our water supply and the fertility of our farm lands depend on the existence of our forests. The Girl Scouts are being taught all these things, under the able leadership of Mrs. Rippin, and they realize that future generations must be protected.

Aside from the conservation of the forests for the nation's welfare in the future, reforestation of waste lands is a means whereby Girl Scout camps can be made self-supporting. The seedlings and transplants can be obtained at cost of production from the Conservation commissions of nearly all our timber-growing states. Money will begin coming in at the expiration of ten years when the thinnings are sold for Christmas trees.

At Camp Andree they are planting the trees six feet apart, making 1,210 trees to the acre. The Girl Scouts work in crews of two; one makes the holes with a mattock and the other follows up with the seedlings in a pail of soil and water. Great care must be exercised to prevent the roots from becoming dry as the tree will certainly die if the wind or sun dries the tiny fibrous rootlets.

After the trees are planted, little need be done for ten years, except to protect them from forest fires and grazing stock. In 1934 the seedlings now set out will require thinning. Then every other tree will be cut and sold without in any way doing harm to the forest already created. Or the thinning trees may be potted and sold as Christmas trees and later the children may replant the Christmas tree and use it several seasons, replanting it carefully from the tub. The trees left after thinning will have that much more sunlight and room to spread their crowns, but will not be open to the extent that they will grow "limby" and thus make knotty lumber of low value. Instead they will grow tall, slender, and straight, shedding their lower limbs, making clean saw logs, eighty or one hundred years from now.

One of the most important means of

Lake Dunmore, in the Green Mountains of Vermont, where 1,150 acres of woodland

ssuring a continued sentiment in upport of the forestry movement is he mobilization of the young people, nd perhaps the most consistently ctive organization in this direction is he Boy Scouts of America. With oodcraft and forestry, and other utdoor knowledge—a part of the cout's study for which he receives erit badges—this organization has lready accomplished a great deal.

In several states, the forstry and conservation offiials call freely upon the Boy Scouts for assistnce. The Conservation ommissioner of Masschusetts has declared hat he will grant to ny troop a permit to ake camp in a state orest, knowing that he camp will be left in ood order and all fires ut out. The Scouts ave made a name for hemselves in forest firehting, particularly during he war when they were reruited to patrol the trails in the ational forests, replacing the en who had gone to war. On one ccasion they located many black alnut trees needed by the govrnment for airplane construction.

In many states the Boy Scouts are rganized under the state fire warden as orest guides, having official recognition from the state. In New Jersey, Conecticut, or Pennsylvania, for example, is not uncommon to see a diminutive cout directing a gang of husky amteur fire-fighters. The Scouts have ut many miles of trail, making firehting easier. Living as much as they o in the forest, they study the various inds of trees, the diseases that affect hem, and acquire a special interest in hem. They wear their merit badges for fficiency in forestry with great pride nd they constitute an important otential force in carrying out a comrehensive national forest policy.

Mention has been made of the Boy Scouts as a means of enabling he reader to visualize the possibilities f the work of the Girl Scouts when very troop is organized as a forest guard. While it might be impractical for the girls to direct operations in a forest fire, in all other forest activities they would prove invaluable. They would instill in the children to come the love of the forest and the preservation of our recreation grounds.

Mrs. Jane Deeter Rippin, national director of the Girl Scouts of America, directs the planting of 3,000 trees at Camp Andree, Briarcliff Manor, New York.

Forestry instruction in the public schools is a field as yet only lightly touched as a means of creating a forestry sentiment among those who will feel the pinch of past forest depletion. In a handful of the states real action is being taken in this direction.

With the summer camp taking an increasingly important position as an adjunct to our educational system, and with more than 100,000 boys and girls spending most of the summer in the out-of-doors, practical forestry is becoming a recognized activity. The interest of the country in the forest problem has made this phase of camp work both popular and profitable, and has enlisted the coöperation of public officials and supporters of the forestry movement. Camp Mishike, at Winchester, Wisconsin, may have the distinction of performing the first real activity as a non-professional forestry summer camp. The theory on which the sponsors of this camp are proceeding is thus stated:

"Teaching the youngsters that Nature is neither a tool to be used nor an enemy to be conquered, but rather a friend to be cultivated, is the major objective in this first forestry camp for boys. Not to make foresters of the boys but to inspire in them an appreciation of the out-of-doors is the keynote of every camp activity."

The staff of the camp is made up of trained foresters, who know how to take care of themselves in the woods and teach their young charges the same reliance. Twelve thousand trees were set out in the camp nursery last spring and the goal is to restore on the camp's acreage the forest growth that once made that north country a woodland paradise. Reforestation on the forest property of 1,700 acres will permit the boys to learn the fundamentals of forestry in thinning out less valuable trees and aiding nature in natural regeneration.

At the Keewaydin Camps on Lake Dunmore in the Green Mountains of Vermont, boys in the Senior Wigwam "major in forestry." The camp recently acquired the entire western side of Moosalamoo Mountain, overlooking Lake Dunmore and the camp, within easy distance of the thirty thousand acres of the Middlebury College Preserve, and within sound of a big lumber mill.

The boys built a lodge and three outdoor sleeping cabins. With axes and brush hooks they cleared out the underbrush, swamped out roads, felled the least desirable trees, trimmed up the best ones, and made new views out on to the lake. Nature study, identification of trees, use and care of tools, tree felling, and control of fires went hand in hand with the other work.

A series of talks on forestry and conservation was given on occasional evenings around the outdoor fireplace by different members of the staff, according to their special fields of experience. White pine and Norway spruce were purchased and planted by the boys. None of the work was compulsory, but the boys worked with a will and absorbed a love and knowledge of the woods while working.

A civilization that is becoming more complex and exacting in its requirements carries within itself the seed of its own destruction. Our ancestors were forest or plains dwellers and the call of the wild comes down through the centuries. We must encourage every means undertaken by our youth to preserve and perpetuate our forests.

being brought under forestry management by the boys of Keewaydin Camps.

To Make a Record, Don't Worry

Athletes Do Their Best Work When Entirely at Their Ease

By GILBERT C. ALLEN

ATHLETES never do their best when trying too hard. The man who goes out intent upon making a record, and who throws every ounce of reserve energy into his effort, does not make one. The men who hold the track and field records made them when they least expected to do so. At the time they were creating new marks they were not conscious of it. The fact that they did better than man ever did before came as a keen surprise to them.

The explanation of this statement, absolutely contrary to public opinion, is simple enough. A man does not have the desired control over his muscles when he strains. This control comes only when the muscles are relaxed and "easy." He slows down when he begins straining himself.

Thousands of Americans have now had the opportunity to watch Paavo Nurmi in action. They marveled at the ease and rhythm of the wonderful Finn's stride. He never appears to be working hard but he establishes new world's records with ease. Others run with many times the effort that Nurmi shows but they fail to get results. Joie Ray, the most consistent star in the mile run, is also a remarkably smooth and easy runner.

Fred Tootle won the hammer throw at the Paris Olympic Games last summer with a heave of 174 feet 10 inches. After the event was over Tootle was asked by the motion picture men to go through the hammer throwing again so that they could get some good action shots. Tootle obliged them. He threw the hammer twice. One of these throws was several feet beyond the world record of 189 feet and the other was 188 feet. Tootle was at ease when he made these two throws. There was no strain of competition. The event was won and he had nothing to worry about. As a result he threw better than he did when competing on the previous day.

When Tootle Made His Best Throw

One afternoon, in the American training camp near the Colombes Stadium, a number of Yankee athletes were playing with a shot. They were not shot putters for shot putters always try high jumping when they have leisure moments. The athletes were not getting much distance to their throws. Ralph Hills, the giant from Princeton, happened along and offered to show the boys how the shot should be put. Without removing even his coat Hills asked his audience to watch him closely. Hills then threw the ball 50 feet, better than he had ever done in competition. No strain of the contest, no worry about distance, and Hills made the best put of his career.

The failure of Charlie Paddock, the American sprint star, to win the 100-meters race at Paris, was a bitter disappointment to his many followers. He placed fifth in a race that everybody expected him to win with ease.

In the 200-meters race Paddock placed second to Jackson Scholz, running a remarkable race. Why did he suddenly change? The reason:

Bob LeGendre Makes an Easy Jump

Paddock knew that everybody was sure he would win the 100-meters race. He did not want to disappoint anyone. He was overanxious to make good. He tried too hard. He over-pressed and he strained his muscles so hard that he slowed down. Just before the sprinters took up their positions for the 200-meter dash Bill Morris, the trainer and a former runner, said to Paddock:

"Now, Charlie, don't run this race like you ran the 100. You've been trying too hard. Take this one easy. Just run as you would if you were giving an exhibition. Nobody expects you to win this event."

Paddock ran easily and he was just nosed out of the Olympic 200-meters championship.

Bob LeGendre's world's record broad jump, made during the pentathlon competition at Paris, came as a great surprise. The day after this record was made DeHart Hubbard, of the University of Michigan, who had already won the regular Olympic broad jump championship, and who also held the intercollegiate broad jump title, was talking to LeGendre about his great leap.

"How did you feel when you were making that jump?" asked Hubbard.

"I hardly knew I jumped," answered LeGendre. "I just ran down to the board, hit it squarely and jumped. It was one of the easiest jumps I ever made."

So it goes. Ask any athlete if his best performances were his hardest and he will invariably tell you that his best record was made when he least expected it and that it was done with ease. Perfect relaxation and coördination that come with easy action get the best results.

A Surprise For Bob Simpson

Bob Simpson set a record for the 120-yard high hurdles event at the Western Intercollegiate meet in Chicago. The time was announced as 14 3/5 seconds. Simpson really did the 120-yard high hurdles in 14 2/5 seconds but the timers decided that some mistake was made. They could not believe their watches, although all registered the time as 14 2/5 seconds. The timers decided that no human being could run the 120-yard high hurdles in that time and so they compromised and announced 14 3/5.

Simpson was the most surprised man on the field when he found that he had set a new mark. "Why, I never ran an easier race in my life," was his comment.

Later on Thompson, the Dartmouth crack, ran the 120-yard high hurdles in 14 2/5 and received credit for setting a new world mark. What Thompson did was to tie Simpson's actual time.

The most consistent of all performers on track or field is Harold Osborne, the all-round star of American athletics. No high jumper in history ever showed the consistency of Osborne. He holds the world's record of 6 feet 8½ inches and he will jump that height regularly. Why? Ease is the secret of his marvelous jumping. Osborne approaches the standards at a pace that is hardly faster than a walk. He has form down to perfection. He is the symbol of grace and ease.

How Brooker Missed His Chance

Records come when you least expect them in track and field and defeats come just as easily. In competition you must make every little thing count. It is the little things that bring the big defeats.

Jim Brooker, of Michigan, is a first-class pole vaulter. On numerous occasions Brooker vaulted 13 feet. On the day the pole vault was decided in Paris, Brooker was what they call "hot" in intercollegiate circles. Brooker was going at the top of his form and there was every reason to believe that he would win the event. It seemed certain that he would do better than 13 feet that day and all seemed agreed that 13 feet would win the event.

When Brooker vaulted 12 feet 8 inches the event was stopped to permit the 5,000-meter race to be run. Paavo Nurmi was running in that race and the officials did not want the pole vault to distract the interest of the crowd. The vaulters sat around and waited for Nurmi to win his race. When they resumed competition all had been chilled. Their muscles had settled. Brooker is a big fellow and he cannot warm up easily. He had to vault while cold and he missed at 12 feet 9 inches and his chance for an Olympic championship went glimmering.

The 110-meter hurdle race was being run in Colombes Stadium. All the hurdlers were going over in perfect form, as one man. For four hurdles hardly an inch separated the contestants. Then one athlete gained a trifle on the fifth hurdle. It was Karl Anderson, of the American team. *(Concluded on page 23)*

How We Got Our Present Calendar

(*Concluded from page 8*)

were changed to thirty days with thirty-one for October and December.

Thirty days have September,
April, June and November.
All the rest have thirty-one
Save February which alone
Has twenty-eight and one day more
We add to it one year in four.

Our Christmas week is directly connected with the Roman feast days called Saturnalia, beginning December 17, or the sixteenth day before the Kalends of January, as the Romans put it. Calls on friends, gifts and games, and even special cakes were on the program, very much as we have it now at Christmas.

Among the Mohammedans of the earth, including a greater population than the Christians, the year determined by lunar months still reigns. The Arabs date events from the flight of Mohammed from Mecca to Medina, Thursday, July 15, 622. This year has a mean length of 354-11/30 days and in the course of about 32½ years the seasons recur during the same months.

Our A. D., *Anno Domini*, or Year of our Lord, was suggested by a pious monk in Rome, Dionysius, who died in A. D. 540. Before that time years were given after the Roman manner "from the founding of the city" (Rome) which took place 753 B. C. The coin with the date 24 B. C. is a little previous. Since the placing of the beginning of the Christian Era at 753 years after the founding of Rome, more critical study of the time of Christ has shown that there is an error of about four years in the probable determination.

Following the Roman procedure March was taken as the first month. However, some more pious souls took Christmas Day. Not until 1566 did France take January 1 as the year's beginning and England fell into line only in 1752. Naturally the English Colonies in America followed the mother country. In early newspapers and letters a date, January 4, 1741, would be given January 4, 1740-1741, meaning that the New Year had not yet begun.

To make matters worse the Julian Calendar was too generous with leap years, providing the ladies with one *every* four years. The disastrous effect was apparent after a few hundred years, as this assumes a year of 365.25 days instead of 365.24220 days. These decimals had accumulated to more than ten days by 1582. On March 1, 1582, Pope Gregory XIII issued a papal bull, dropping October 5 to 14 absolutely from the calendar of 1582. This established the Gregorian or present calendar, with the further provision that every even century would not be a leap year unless divisible by 400. England did not accept the new calendar until 1752, because of her separation from the church of Rome.

The celebration of Easter has also caused astronomers and almanac makers a great deal of difficulty. It would, of course, be most convenient for the calendar maker if Christmas came always on Sunday or on Monday, and if Easter would certainly fall on April 1 or some other definite day. However, Easter depends on the position of the moon in the heavens, and the moon is temperamental with respect to the year. Easter is termed a movable feast day, whereas Christmas and New Year's Day are fixed feasts. Every 19 years, Meton's cycle, the new moons fall on the same days of the year; this gives a cycle of 19 years and in ancient calendars a golden number was placed to indicate the cycle to which the year belonged. The golden number of 1925 is 7, obtained by dividing 1925 plus 1 by 19 and finding the remainder.

So on the ancient and beautiful calendars the holy days and feast days were marked with red letters. So we still have our red-letter days.

The seven-day week:

Sunday	Sun's Day
Monday	Moon's Day
Tuesday	Tiw's Day (French, *Mardi*, Mars Day)
Wednesday	Woden's Day (French, *Mercredi*, Mercury's Day)
Thursday	Thor's Day (French, *Jeudi*, Jove or Jupiter's Day)
Friday	Frigg's Day (French, *Vendredi*, Venus' Day)
Saturday	Saturn's Day

The connection with the planets is evident and our English names carry a change to certain Anglo-Saxon divinities.

In the time of the French revolution the week was to be divided into ten days but this was not physically correct nor did a rest day in ten instead of seven appeal to the workers. The Year I was to begin in France with the date of the proclamation of the republic, September 22, 1792. The rest of the world did not regard the revolution in France so seriously and after about fifteen years France returned to the Gregorian Calendar. However, the metric system of weights and measures, established about the same time, did prove a boon to mankind and gradually this system is making its way over the civilized world.

Hours, minutes, and seconds are Latin words, but Babylonian ideas. In Babylon, first the day was divided into twenty-four hours and the hour into sixty minutes. The Latin name was given as "minutae primae" and "minutae secundae," meaning first fractions and second fractions. The "primae" was dropped, leaving "minutes" and then "secundae" gave our "seconds." The repetition of 1 to 12 around the clock has certain inconveniences as anyone can tell who has used a railroad time-table. Here the device is now frequently used of having darker figures (black face, *1, 2, 3*) for p. m. and light face (1, 2, 3) for a. m. In Italy and to some extent in Canada the day is divided for the railroads, at least, into 24 hours. In consequence, your train in Italy may leave at 15:20 meaning twenty minutes after three.

The recent Olympic Games remind us of the system of Olympiads used by Greek writers. This was the period of four years from one period of natural games to the next, a truly poetic way of regarding the flight of time. As might be imagined this system was especially popular with the poets and would be welcomed today by the great majority of young people in our high schools and universities, called students after an ancient custom.

To Make a Record, Don't Worry

(*Concluded from page 22*)

Over the sixth obstacle floated Anderson, retaining his slim lead. Then, at the seventh hurdle, Anderson fell. The other hurdlers flashed past him. He got up and finished last.

What caused Anderson to fall? He had failed to raise the toe of his rear foot high enough as he was going over the hurdle. It barely caught the top of the wood but caught enough to trip and spill him. Only a little thing, a matter of the fraction of an inch, but it cost Anderson an Olympic championship.

J. Coard Taylor is one of the best quarter-milers in the United States. He was on the Olympic team and had reached the finals of the 400-meters run. This, in spite of the slightly pulled tendon that had bothered him. Billy Morris, one of the Olympic trainers, had bandaged Taylor's leg and it stood the strain of the preliminary trials and the semi-finals. But, just before he went on the field to run the final race, Taylor got the idea that he did not need the bandage and he removed it. And the result? Taylor ran in third place in a record-breaking race until about 25 yards from the finish when his bad tendon gave away on him and he fell. He got up and finished last. Had that little bandage been allowed to remain he would have finished third instead of sixth.

It is the little things that count.

Thomas F. Lee, Latin American authority, traveler and writer, began work in Mexico twenty-one years ago as engineer on the harbor works of a West Coast port.

Since that time, he has lived or traveled among the Spanish American people, studying their racial character and ideals, and economic and political institutions.

In many instances, Mr. Lee has supplied the facts upon which banking loans or credits to those countries have been based.

During 1919–20–21 he was executive director of the powerful association formed to defend property owned in Mexico by American citizens and jeopardized by the confiscatory provisions of Mexico's 1917 Constitution.

Certain important and interesting material resulting from Mr. Lee's experiences in Mexico will appear in this magazine from time to time.

Rich Have No Homes in Central America

By THOMAS F. LEE

IN the Spanish language there is no word for home. The word commonly used is "hogar," meaning "hearth," but in the Central American house there is no hearth, as we think of it, since heating is unnecessary and cooking is done over an open wood or charcoal fire.

"*El patron esta?*—The master is in?"

"*No, senor, no esta en casa*—No, sir, he is not in house"—but never "he is not at home," for the significance with which we have endowed that word does not appear in any Spanish expression.

The typical Central American home of the upper class is an Arab institution. It was designed originally as a safe and comfortable abiding place for the harem of some sheik. It is a rectangular, one-story structure, with thick walls of adobe blocks, deep-set barred windows and a jail-like appearance. Once inside the forbidding exterior, there is the *patio*—that charming and distinctive indoor garden, with fountain, palms, orchids, and giant ferns, its roses, honeysuckles, and climbing geraniums—a little tropical paradise open to the sky and with each room of this oriental living place opening out into it.

Home of President Quinones, of Salvador, combining a French exterior with a Spanish patio.

The Moors brought this type of house into Spain, where it was hailed as an architectural blessing and immediately adopted by Spain and her colonies. Of course, there are now a limited number of fine dwellings in Central American cities built more or less after our own style, but they always seem to be out of place. The *patio* house is typical and adapted to the climate.

Near the one entrance is the "*sala*"—the reception room—and across the patio, to the rear, is the "*cocina*"—the kitchen—and the living quarters of numerous servants. The other two sides of the quadrangle are divided into sleeping rooms and the "*comedor*."

The floors are tile, blue or gray, cool and clean. The ceiling is of pressed tin or canvas tacked to beams and gaudily decorated. The roof is covered with picturesque red tiling well designed to turn drenching rain or scorching sun. Occasionally, a tile shaken loose by the "*temblor*," plops down through the canvas ceiling and into the family circle.

The rooms will be rather scantily furnished, a foreign-looking piano in one corner of the "*sala*," a huge settee—a sort of family throne—backed up to the wall with two batteries of huge rocking chairs flanking it. Household ornaments and pictures will suggest religious subjects. The guest chamber will be furnished like most bedrooms of Latin America, with a canopy-covered bed, a washstand with enormous basin and pitcher of that enameled metalware with which Germany has so liberally supplied Latin America, mahogany chairs made in the local "*carpenteria*" and a small stand by the bedside on which one's candle is placed, for electric and gas lights are not as yet common to all such buildings.

The kitchen is the interesting room of the house. For some unexplained reason, it is seldom given any more light than that which comes in from one door entering into the *patio*. Many times I have marveled at the Indian or Ladino cook preparing a course dinner at night by the light of a single candle. There is a raised brick fireplace, built to the height of the ordinary stove and with several little brick troughs on the upper surface where charcoal and faggots feed the fire. The Indian cook demands native cooking utensils—dingy, sooty, "*ollas*," and other earthenware pots—she would not know what to do with a double boiler, a roaster or a percolator. Always there is the "*metate*"—a stone slab for "*tortilla*" making, for the servants prefer the "*tortilla*" and "*frijol*" of their fathers to the more delicate food eaten by the family. Dishes are washed in cold water, because the "*cocinera*" firmly believes that washing in hot water would imperil her health—"*me hac dano*"—"to me it makes harm"—she will tell you.

Among kitchen furnishings should be mentioned naked babies who creep about the tiled floor after their mothers and the turkey or chickens huddled in one corner, awaiting their turn at the guillotine.

Let us visit, for a day, the typical family that lives in the *patio* home.

People of the tropics are early out of bed. At five o'clock the "*portero*" will be heard clanking at the huge bar and lock that secure the one door. The "*cocinera*," with her helpers, is up betimes, for there are no modern stoves with gas or coal fires. Cooking is a slow process and I have often

admired the skill with which the native Indian cook produces palatable food with these crude facilities.

At six o'clock the family is up. The morning bath, to which we are accustomed, "*no existe*," for these buildings are guiltless of plumbing, except for the pipe which carries a constant stream of water to the "*pila*"—the big water tank and general wash place. "*Agua caliente*"—hot water—is heated in an earthenware bowl over a charcoal fire and is a luxury that is measured in quart bowls instead of porcelain bathtubs. If one suggests a bath, the host immediately lifts a dissuading hand—"Do not risk it, *senor—le hace dano*"—"to you it will make harm."

Children of the upper class are cared for by Indian nurses, so they are saturated with Indian folklore and superstition.

At a plantation home in Guatemala, I bathed in an indoor pool curiously suggestive of the Roman bath. A concrete flume, running from a mountain stream and through the very top of the plantation house, carried a rushing head of water. Adjoining my bedchamber was a room, or rather a sunken basin, twenty feet square and lined with brick. A lever in this "bathroom" diverted the overhead stream to convert the tank into a brimming, sparkling pool. But such a bathing place is not common anywhere—it certainly does not belong to our typical Central American home.

The early meal—"*desayuno*"—is a simple affair in this family—usually limited to coffee and "*pan dulce*"—really excellent sweetened rolls covered with sugar. The coffee is the cold "*esencia*" or essence and generally served in a vinegar cruet. Unless one is a stranger to customs, a tablespoonful of the thick black fluid will be poured into the bottom of the cup and then diluted with hot milk.

The "*lechero*" brings the milk in "*cantaros*" swung on either side of his mule, or an obliging family of goats is driven to the front door, in which case the milk is delivered on foot—milked in the presence of the purchaser, delivered warm and undiluted. In any event, it will be immediately boiled, for the double purpose of purification and preservation. The use of ice for refrigeration is not yet a common practice.

"*Desayuno*" over, the head of the family joins his "*dependientes*" in the "*oficina*" which is open before the business man of the North is fairly out of bed. The housewife directs the affairs of her many servants and since there is no grocery in the same or the next block and since telephones have but limited use and never connect with the market place, the housewife either goes with her cook and "*mozo*" to the central market, or the cook takes her helper and lays in the day's supply of food. The latter is the accepted custom, the housewife providing the cook with a fixed monthly sum with which she must feed the family. Strange as it may seem to the harried housewife of the "U S A," this plan works surprisingly well and the Indian "*cocinera*" not only supplies an abundance of plain food but manages to support her own family out of the surplus and lay aside for herself a modest saving, and all this from an allowance that would seem woefully inadequate to us.

The "*cocinera*" of such a household becomes singularly adept in the art of bargaining with the market people. This provides the cook and the market woman from whom she buys with their daily thrill. Not only does she haggle with the market woman over prices but she refuses to become a buyer even when "*el ultimo precio*" has been reached, until the market woman contributes a substantial "*propina*"—some little gift. The cook would not, of course, degrade herself by carrying the purchases home. For that purpose, a "*mozo*" or her assistant accompanies her, carrying on the head a wide flat basket into which vegetables, meats, fruits and flowers, chickens, eggs, sweetmeats, and rolls make a varied pyramid.

All this has taken place before the sun is well up. "*Los ninos*" have been sent to some private or parochial school and the "*senorita*" of the family—a young woman of sixteen—does her stint of fancy needlework, her drawing or her scales or some one of those other things which the Latin American mother deems essential to the education of her daughter. Perhaps a son is in the States in "*colegio*," or in "*Europa*," completing his education.

At noon comes "*almuerzo*"—the universal breakfast of Latin America—always with eggs, rice, red beans or "frijoles fritos," fried bananas, native vegetables—generally with excellent rolls (but without butter) and, not infrequently, even in the better families, with the dependable "*tortilla*"—and always coffee.

Since breakfast time in Central America is somewhat after noon, the intense heat of the day has begun. Shops and offices are closed, to be opened again between two and three in the afternoon when the "*siesta*" hour is over.

After the midday meal and rest, business is resumed but without too much enthusiasm. Real interest is not reawakened until about four in the afternoon, from which time until seven, the real "*movimiento*" of the Central American town takes place. As midday heat abates, the shops are busy. Our housewife, accompanied by the daughter, visits "*el centro*"—the downtown—for the daughter never leaves the family *patio* unaccompanied. Always there must be a trusted servant or some member of the family with her. To be seen alone on a public street with a man other than of her immediate family would be to compromise her and to render her chance for making desirable marriage remote. The Central American is wholly cynical in the matter of friendly or platonic association of the sexes.

In the "*dulceria*," a young "*caballero*"—a stranger—sees the girl and is impressed with her charm. Not knowing the family, there is but one conventional course for him to follow. First, he stares at her, registering extreme admiration, which she secretly regards as complimentary attention, although she affects not to see him. He then discreetly follows the girl and her mother to their home and for some time after they have entered walks up and down the opposite side of the street, gazing steadfastly at the barred window which he imagines to be that of her room and expressing adoration insofar as the human face may portray that emotion, knowing that all the while the *senorita*, in a flutter of excitement, is regarding him from behind the Venetian blinds. After the proper time, the swain retires, to return next day, perhaps, at two or three unexpected times to resume his romantic vigil. Of course, the parents are not unmindful of this delicate attention and "*pater familias*" takes proper steps to ascertain the identity, the moral and financial standing of one who may be a potential son-in-law. If the attention is agreeable to the young lady and if the pedigree of the prospective suitor is favorable, perhaps after a week of unrewarded vigil, the *senorita* will appear quite casually at the barred window during one of the persistent visits, cast an idle glance at the sky and otherwise display interest in all of the immediate surroundings except the swain himself. Being well acquainted with the game, however, he is far from discouraged and regards this appearance on her part as evidence of the favorable consideration of his suit. In another fortnight, affairs may have progressed to the point where he will have breathed a few words of burning devotion under her window ledge, she, as yet, not deigning to reply. At this stage, evening visits to the barred window and extravagant

love lyrics sung to the soulful strum of a guitar are not out of place. Comes the day, perhaps, when the courtship has reached a stage wherein the fair maiden drops a scented handkerchief at the feet of the "bear," for this game is called "playing the bear."

With this treasure in hand, he feels the brunt of the battle is passed. Who knows—tomorrow he may even be permitted to kiss the hand which she extends through the bars and then be invited to meet the family! Generally at this stage, if all goes well and the young man's credentials satisfy the exacting parents, he will be invited to call and then, in the presence of father, mother, brothers, sisters, cousins, aunts and uncles, he will be formally presented to the girl of his choice and will propose marriage. Now he is her "*novio*" but from that time until the pair stand before the altar, he will never be permitted to see his beloved, except in the company of others. The cynical Central American takes no chances—"*no es la costumbre.*"

During this period of courtship and after presentation to the family, they will meet many times at the "*baile*"—the dance—where for a brief moment he may take her from mother or "*la duena*" who chaperones her and know the delirium of a moment's waltz.

The wedding will be an important "*funcion*" and those who attend will give due thought to proper dress. There will be much white satin—quantities of flowers heavily fragrant—"*caballeros*" attired "*de rigueur*"—much dignified salutation—profuse congratulatory remarks—a wedding breakfast—marimba—champagne.

After marriage, the wife sinks into the conventional life of the Central American woman—the raising of children, attending mass, making a home for her lord and master, whose romantic attitude is usually dropped at the altar and who, following the custom of Latin American countries, does not scruple to form other feminine alliances. The "double standard" is accepted in Latin America as an institution. In the home and its duties—in the care and upbringing of her children—the mother is supreme. This is her life work and she devotes herself to it with a fine fidelity. The Central American mother seldom shines as a social light and she will seldom be seen in restaurant, theater or other places of public diversion such as the women of our country frequent as a matter of course, and she forms but little part of her husband's life outside the home. The ancient feudal conception of the woman is still in the subconscious mind of these people—she is still more or less a chattel—the man is lord and not to be questioned. The family picnic, an occasional bullfight and, in latter days, an infrequent visit to the cinema, offer diversion in the larger centers, but the housewife finds daily contact with her kind in various forms of church service or work, for the Central American woman is a good Catholic and daily religious service of some kind is an important part of her life.

The family dinner is served late in the evening—seldom before eight o'clock—so the opera or "*zarzuela*" and such other formal entertainment as the Central American attends usually begins not earlier than ten o'clock—but these functions are rare. The Central American does not indulge in the night life that is common to the people of our cities. For so many hundred years it was unsafe to be abroad after nightfall, that the habit of early retiring persists.

The windows of the sleeping rooms are guarded with formidable vertical bars—seldom is there glass. But no self-respecting Central American family would think of sleeping in a room with an open window or any other opening that would admit fresh air. The night air "*se hace dano,*" they will tell you. They, therefore, close tight-fitting doors inside the bars and fasten them securely. I have slept in rooms in the tropics that were all but hermetically sealed, because my host, who shared the room with me, insisted that the night air would "make me harm."

On the hacienda.

I slept in a room fronting the street at Hotel Manchen, in Antigua, last spring. Before retiring, I opened wide the inside shutters to admit the glorious spring-like air of the Guatemala uplands. I was awakened from a sound sleep by a tapping on the iron bars of my window and a voice calling

Going to market.

gently, "*senor—oigame, senor*—sir, listen, sir, your window must be closed—it is not the custom to sleep with your window open, and besides, '*el hace dano*'—it will do you harm." Even the policemen are in the conspiracy against fresh air and so thoroughly ingrained is this belief that the lower classes, and especially the country people, frequently cover the mouth and nose with a "*zerape*" when going out into the night air.

In this sketch of home life, a city home was chosen because the Central American of the better type lives in some town, even though he be a "*finquero*" or "*haciendado*" with a plantation home.

In Central America there is no great middle class. There is scarcely a trace of that public opinion which is usually the product of well-to-do mediocrity, the bourgeois of European states. There is only a dominant property-owning and more or less educated class—perhaps, in all, fifteen to twenty per cent of the total population. The other eighty per cent is made up of human beings so low in the social scale that we have no class in this country with which to compare them. Food, shelter, and clothing of the simplest character supply their demand upon life.

Greely Survivor's Story of Heroism

(*Concluded from page 19*)

them. Among these was a case of lemons, wrapped in newspapers. This was the first news from the civilization that we left behind in three years, and you can imagine the painstaking care with which we removed these scraps of paper from the lemons. Then, by the light of a little seal oil lamp, the surviving members of the party grouped around the person designated to read the news pieced together by half-frozen hands.

News From the Outside World

"We found in the remnants of the wrecked *Proteus* an almanac of 1883 and in this was a chronological table, from which was gleaned the news that President Garfield, who had been assassinated, had died from the wounds. Also something was learned of the fate of the *Jeannette* Arctic expedition, commanded by Lieutenant De Long of the Navy. This expedition was named after the vessel used. This exploration was financed by James Gordon Bennett and the explorers had traveled by way of Bering Straits. Many of the members of the crew had been lost. When we departed from the United States news of the fate of this expedition was not available, and the first knowledge gained by us was through the medium of an almanac.

"In a lantern was found a letter written by the grandson of Henry Clay. This young man had traveled with the Greely expedition as far as Greenland, but due to lack of accommodations or space for him he had returned home. Meantime, he had published a letter in the *Courier-Journal*, Louisville, Kentucky, suggesting a method for our relief, indicating that the party would come down on the Grinnell Land side. He stated that supplies should be left at various points and that unless such measures were taken the members of the expedition would starve. The first relief party carried the supplies to a point near our camp but returned the provisions to St. Johns instead of distributing the food as suggested. Consequently, this prophecy was fulfilled except in the case of seven members, one of whom died on the rescue ship.

Arrival of the Rescuing Ship

"The real rescuing ship arrived on June 29, 1884. A report of the whistle was heard at Cape Sabine, which it developed later had been blown to recall some of the crew who had gone ashore. We could not at first believe that it was the whistle of a relief expedition. We had become reconciled to an inevitable death. Sergeant Long and myself had crawled to a point a few feet above the camp where we could overlook the sea. The weather was cold and a strong wind was blowing. I returned to the camp and reported there was nothing in sight. I had concluded that the whistles heard were sounds produced by wind blowing over tin cans which had been filled with water and placed near the tent. This was done to prolong life, believing that water even in the absence of food would lengthen life for awhile.

"I crawled back into my sleeping bag, never expecting to get out again. Only a few shrimps and a little sealskin, with possibly a few pints of rock lichens for adding to stews, were left as a food supply. Furthermore, a windstorm had for three days prevented the kindling of a fire as a means of preparing the food for consumption.

"Private Connell was unconscious at the time the whistle sounded and H. Biederbick, who was close to Connell, picked up a hot-water bag containing some brandy. Alcohol was never used on sledging journeys, but we carried some alcohol, and this with what brandy and gin were available was kept in hot-water bottles of rubber—the ordinary kind. Biederbick found a tablespoonful of brandy remaining and, with the whistle still sounding, the brandy was poured down the throat of Connell. This revived him somewhat, although he clearly had the symptoms of starvation.

"The relief party then arrived. Milk punch and a cracker or two were given us to appease the pangs of hunger. However, I believe that if the rescuers had said, 'We are going to leave you here,' we would have responded, 'Go.' We wanted merely to rest. Death had ceased to hold any terrors for us. We were taken aboard the relief ship and each survivor given a bath, put in warm pajamas, and then tucked in real beds.

A Rapid Recovery in Weight

"Every three hours we were given a small amount of food—a tablespoonful of raw beef chopped very fine, a little oatmeal, and condensed milk, which had been diluted and sometimes combined with a bit of brandy. This ration was continued for three days, with the amount slightly increased each time until beginning with the fourth day beefsteak was given, with poached ducks' eggs, and all the milk we could drink. This meal was heartily relished, since for twelve hours after first eating we had felt voraciously hungry. The diet after that was restricted and it was some time before we had access to coffee. The first week I gained 22 pounds; the second week, 20 pounds; and the third week, 18 pounds. I had gone on board this relief vessel weighing only about 100 pounds, 85 pounds less than my weight upon embarking on this expedition."

David L. Brainard was born in Norway, New York, on December 21, 1856, and is now a retired army officer after more than 40 years of active service. He has been promoted in ranks from a private, corporal, and sergeant in Troop L of the Second Cavalry, from 1876 to 1884, to that of Brigadier General of the United States Army, in 1918. He has been cited "for distinguished and meritorious services in connection with the Arctic Expedition of 1881-1884." While the crowning distinction of his participation in this expedition was that of having reached the point farthest north up to that time, the records and scientific observations that he helped to preserve on that ill-fated voyage will be of enduring benefit to mankind. Although three-fourths of the members of the exploring party perished, the records and instruments that have contributed to the world's knowledge were brought back in perfect condition.

Three-Fourths of the Party Perished

"Through the journeys by Lockwood, Brainard and Christiansen," says Major General A. W. Greely, head of this expedition, "it passed the north end of Greenland and practically determined its insularity, discovered a new land to the north, Hazen Land, and attained 83°24′ N., 42°45′ W., a world record for the highest north, which has since been verified by Peary."

These newly discovered lands aggregate 6,000 square miles and the expedition extended one-ninth the way around the world. The adventuresome spirit of Greely, Brainard, and that group of explorers that invaded the very jaws of death means that we, as citizens of the United States, are more familiar with the factors governing our climatic conditions and the tidal activities of the Arctic Ocean, as well as having added to the science of magnetic observation.

General Brainard is the proud possessor of an inkstand, found 25 years after the Greely expedition by Admiral Peary at Fort Conger, which was presented to him by the discoverer of the North Pole upon his return to Washington. Admiral Peary also found a sealskin coat bearing the initials "D.L.B."—the property of David Legge Brainard.

The Real 'Cappy' Ricks

(*Continued from page 5*)

ate traveler. He is always just starting for some place or just returning—China, France, the Pacific Northwest, anywhere that his vast interests take him. Moreover (and this is significant of the man's whole life), although he is one of the richest men in America, when he travels by railroad he does not use a private car as do so many millionaires, but he rides in the regular sleepers along with the less distinguished passengers.

He is the most approachable of men, and the most obliging.

A little while ago Captain Dollar visited one of his logging camps deep in the forests of the Northwest. There he lived the rough life of the logger, slept in a hard, wooden bunk, and ate plain camp chow without trimmings.

"And he literally walked me off my feet," his camp manager said later, describing the visit. "One morning we tramped for fourteen miles through the timber, over mountains and across streams, part of the way over broken land where there wasn't even a sign of a trail.

"When we got back into camp he seemed as fresh as when we started out; and I was nearly all in."

Perhaps the true secret of Captain Dollar's success in life lies in his deep and sincere reverence for God. In one of the greatest lumber plants in the world, owned by Captain Dollar, is a little chapel dedicated to service of the Creator. Every time Captain Dollar visits this mill (and this is typical of all his conduct) his first act, no matter how pressing business may be, is to go to this chapel and there ask Divine guidance.

Captain Was Fair Therefore Successful

He is like that in all his tremendous business dealings.

"A man," he told me, "must be fair to be successful. He cannot break faith with his fellow men and hope to have them keep faith with him. And the man who has lost the confidence of his associates is the most pitiful of objects, for he has lost the most precious possession he could have."

The people of China know that Robert Dollar is fair. They know it not from hearsay, for the Chinese do not accept that kind of evidence, but from actual personal contact with the man. No race on earth is so hard to penetrate as the Chinese, but none gives such full measure of trust and confidence in return for fair dealing.

"It took me nearly four years to get within that barrier of reserve which surrounds every Chinaman of higher caste," Captain Dollar said. "Once they learned, however, that I was a friend nothing in their power was too good for me."

Mr. Dollar has as great faith in the Chinese as they have in him.

"China some day will be one of the great nations of the world," he declared. "Her salvation lies in Christianity. It is astounding how rapidly the Chinese are turning to our religion.

"Recently I attended a banquet at which the only guests were members of the Pekin government cabinet and myself. The ordinary bonds of restraint were absent; and I learned there that fully half the members of the cabinet were Christians. For political reasons they do not make that general knowledge in their own country, but among the officials the great spread of Christianity is not only recognized but encouraged."

How to Deal With Bandits

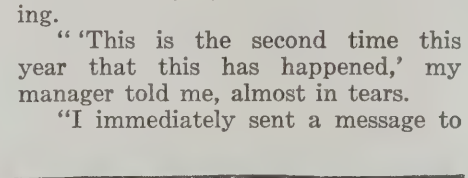
Little suspected by the Occidental races, the Chinese have a keen sense of humor at once rare and delicate. Their wit is quick, like the flashing of a sword in the sunlight, and is a source of constant and keen delight to those who come in contact with it.

"A few years ago," Dollar said, "I stopped at one of our stations in the interior of China, several hundred miles up the Yangtze River. There I found our manager in great dismay.

"Bandits had just swooped down upon the town, sacking it and going through our offices like a tornado. They had stolen everything that caught their eyes, destroyed valuable records, and wound up by wrecking the building.

" 'This is the second time this year that this has happened,' my manager told me, almost in tears.

"I immediately sent a message to



a high cabinet officer, a close personal friend of mine, recounting the circumstances. 'Don't you think that this is a little too much?' I asked in conclusion.

"The answer came back a few days later.

" 'I quite agree with you that twice a year is too often. After this we will see that it happens only once a year.' "

Captain Dollar is probably the greatest example extant of Horace Greeley's famous advice, "Go West." All his life he has been pushing westward until now he sends his ships clear around the world and back to the starting point.

The captain is a firm, a sincere yes, even a devout believer in the great possibilities of the West. His own vast fortune has been made on the West Coast and he believes that still greater opportunities await those who ply their vocations there in the future.

"The era of the Pacific is just at its inception," he declared. "The center of trade is moving westward, always westward. The great nations of the Orient are slowly awakening from their centuries of sloth. Their undeveloped resources, their potentialities, are gigantic, stupendous; they are almost beyond reckoning.

"Commerce on the Pacific Ocean will some day be so great as to dwarf the commerce of all history. And as commerce on the Pacific develops, so will that section of the United States bordering on the Pacific. The future of the West Coast is so linked up with this advance as to be inevitable."

Captain Dollar started on his own march westward at the tender age of fourteen when, with his father, he migrated from Scotland to Canada. Soon afterward he entered the lumber business—feeding a lathe at sixty cents a week!

From such humble beginnings comes the vast Robert Dollar fortune of today. At various times he was a chore boy, a cook, and a logger. By dint of much hard work through these years of apprenticeship he managed to gain himself considerable education.

Fortified with this and with a sound knowledge of the muscular side of the lumber industry, he eventually decided to branch out into the "brain" side, obtaining for himself a humble clerkship.

Strong Will Conquers the Impossible

When he was twenty-eight years old he entered business with a partner. The enterprise soon failed and he was left virtually penniless.

Nothing daunted, he married; and together his wife and he started out to hue themselves a livelihood from the wilderness. The years that followed were lean ones and hard, but the young couple persevered and prospered. Presently he started westward again, this time to Michigan, where he opened a lumber mill. It was a success.

In 1893 he proceeded still farther West to California, where he established another mill.

Captain Dollar was fifty-seven years old when he purchased his first boat. In the beginning he intended to transport only his own product, lumber, and to test out the trade possibilities of the Orient for this commodity. A few years after he opened his shipping office in San Francisco, however, he was pushing still farther West.

This time he opened an office in Shanghai. The ven- (*Concluded on page 2*

Romantic Rascals—No. 3
The Count of St. Germain

(*Concluded from page 17*)

the portico; to watch the descent from it of a tall man, dark-skinned and with a Jewish face, magnificently dressed in blue satin, a plumed hat on his head. To complete the vision of splendor, the postilion and the lackeys were in blue coats braided with silver.

The Maréchal looked up with simulated surprise a little later when the footman announced the presence of the Count de St. Germain, and there were gallantries, and bowings, and advancings, and greetings, and smilings, and many very edifying speeches with veiled pavonine display. Nor, had he been told, would the Maréchal have believed that his splendid visitor was a runaway Bordeaux Jew, afterward a Parisian pawnbroker. But he was very ready to believe that before him sat the philosopher who knew the secret of the water of life, who had, indeed, journeyed to that place for no other reason than to rejuvenate the old courtier worn out with excesses and fat living. So the nobleman was glad, and when in the course of the evening he gave one of his loud laughs, the like of which had not been heard for many a long day in that solemn house, the servants in the kitchen heard, and the Count's postilion who had already spoken of the elixir vitae to his fellows, remarked: "Already the potion is working and your good lord feels the touch of youth."

Two days later the whole countryside rang with the tale of how the Maréchal had been made young again, and to his house came flocking grand lords and courtiers.

The Elixir Was Nothing But Senna Leaves

Soon the tale of wonder was all over Paris, for the Maréchal lost no time in carrying his guest to court. The king himself received the Count de St. Germain with marked favor, embraced him publicly, drove abroad with him for all the world to see, and while the acid-tongued Voltaire said his say bluntly and unaffectedly, his words had little weight. For few doubted that the radiant Count, silk-clad and glittering with diamonds, had a high and splendid secret. And when the learned Colbert declared that the elixir was nothing but a concoction of senna leaves, it was regarded as a foolish statement like that of a glib and silly child.

To the lodging of the Count the fashionable world crowded, entering his reception room as if it were some cathedral because of its artfully arranged dim shadows, its deftly placed colored glass, its wafted perfumes and soft hidden music. Rich old women brought their treasures, seeking in return the glory of youth; courtiers besought his favor; the depressed and morbid went to him for solace; high ministers of state called on him with their problems; wealthy merchants consulted with him; but always gold poured in, gold that he affected to despise saying that by his magic he could draw precious things out of the earth.

Had Aladdin's Lamp at Command

"He showed me one day," writes the Baron de Gleichen in his Memoirs, "so many diamonds that it seemed as if he had Aladdin's lamp at his command." Madame du Pompadour too gave her testimony saying that he once produced, "out of the air," a box containing diamonds, emeralds, topazes, rubies and other precious stones, which he tilted, spilling on the table a glittering shower worth more than half a million livres. As for shaking the confidence of the king, that seemed impossible. "M. de Quesnoy," says Du Hasset, "once said that St. Germain was a quack; but the king reprimanded him. In fact, His Majesty appears infatuated by him and sometimes talks of him as if his ancestry were illustrious."

Time and time again messengers rode to Paris inviting the Count to this palace and that, German, Italian, Russian, Polish; but it was not until a court favorite discovered that, in spite of the diligent drinking of rejuvenating draughts gray hairs grew and wrinkles came, that the charlatan lent an ear to others who called him. So explaining that a quiet and reposeful life was necessary for the pursuit of his further studies, he consented to visit the Prince of Hesse-Cassel, at whose castle, in Schleswig, he died in the year 1784.

But the fellow was not of the sort to let his trade be lost, and while at Schleswig he found another, ready and willing to learn how to trick and cheat the unregulated intellect that always craves a new sensation. His pupil was a convicted thief and forger, one named Joseph Balsamo, who afterward flourished under the titles of Baron de Belmonte, Chevalier de Fischio, Marquis de Melissa, to name a few, but who marched into history and the rascals' calendar as the Count of Cagliostro.

The Real 'Cappy' Ricks

(*Concluded from page 28*)

ture proved profitable, and he turned his attentions more directly to shipping. It was a stormy sea to sail in those days but Captain Dollar navigated it —and won.

When he started his line up the Yangtze River, in the face of almost insurmountable obstacles, he won the admiration of shipping men the world over.

But it remained for his latest achievement to fire their imaginations as never before in history. It came at a time when most American operators were steeped in gloom. The maritime laws of the United States, they complained, were unjust; they worked an unfair handicap upon the American vessels. Captain Dollar may have agreed, and undoubtedly did join them in their protests. But he did not waste his time in lamentations. Instead he evolved plans.

"Impossible," shipping men said, when he first declared his intention of operating a line of steamers around the world on regular schedule.

But Robert Dollar did it.

Seven sister ships were constructed for the new venture. Captain Dollar established twenty-one ports of call: New York, Havana, Colon, Balboa, the Port of Los Angeles, San Francisco, Honolulu, Kobe, Shanghai, Hongkong, Manila, Singapore, Penang, Colombo, Suez, Port Said, Alexandria, Naples, Genoa, Marseilles, and Boston. Then he started his boats out, fourteen days apart.

Operate Ships Under American Flag

And as the hands move around the face of the clock, so did these boats move around the face of the globe!

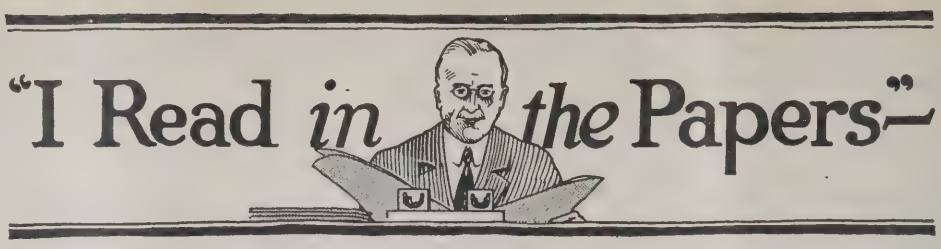
The gods of luck have been good to him, his rivals say. But luck is one word that is lacking from Captain Dollar's vocabulary. In its place is the word courage.

Captain Dollar frankly does not like American shipping laws any better than his competitors. The present regulations are so unreasonable, he says, that British ships traveling through the Panama Canal pay less duty for similar cargoes than American ships.

But Captain Dollar differs from his rivals in one important aspect.

"What!" they exclaim. "Operate ships under the American flag today? It can't be done."

Robert Dollar does it.



I read in the papers something concerning the current temper of a well-known movie magnate which surprised me a good deal. He said that: "A canvass of public desires and a check of various pictures indicate that the film public has a distinct liking for stories unfolding interesting details of human activities such as those revolving about the lumber industry, the forest ranger service, the coast guard, the merchant marine, the automobile business, and similar lines with colorful backgrounds." It would be interesting to know just what proportion of the "stories unfolding interesting details of human activities" have been produced as opposed to the proportion relating to useful industry. An intelligent investigation of the trend of popular interest would show that this nation is something besides an El Dorado for gaudy incompetence and imbecility in the grand style.

The people deserve to be congratulated. They are making the magnates of moviedom move.

I read in the papers that the Province of Quebec in Canada has emphatically declined to permit the extension into it of a railway that is owned by the Province of Ontario and extends from the city of Toronto. The United States had a period of like conflict of state authority. Permission to extend the Michigan Central Railroad across Northern Indiana in order to reach Chicago was denied by the state authorities of Indiana. It required clever, bold work and some subterfuge to outwit the Indianans.

I read in the papers that a New York department store, that is known among merchants everywhere for its enterprise in supplying good wares at reasonable prices, did over nineteen per cent more business in April than it did in the same month last year. No better proof could be furnished of the soundness of fundamental conditions in this country and the ability of business men who really know how to serve the public to prosper.

I read in the papers that the State of New Hampshire will spend fifty thousand dollars to advertise for tourists and also that the state will buy the timber lands in Franconia Notch, the site of the Great Stone Face made famous by Hawthorne. Northern New England, without coal or much water power and with most of its lumber gone, is finding that the tourist business may become a substitute for vanishing industries. Winter sports and vacations are making New England as much of a winter as a summer playground.

I read in the papers that Professor William Lyon Phelps, a distinguished member of the Yale faculty, has just returned to America after three months' illness in Paris and given this advice to travelers: Don't eat overripe duck in a French restaurant. The same advice could be given to all who eat animal food of any kind that has been kept for so-called ripening. Such food is quite unfit for human consumption and if immediate sickness does not result the body is subjected to the task of overcoming toxins or poisons and parasites too repugnant to mention.

Half-Timbered Houses of France

AT ST. BRIEUX is one of the most attractive old half-timbered houses in France. The spacing of the timbers, the pattern of it, in the "tree of life" design, and the carving all about, render the old house of rare interest to all builders of this type of architecture. Observe the simplicity of the finial carvings and dentals and the reliefs—just enough to show through, but not enough to spoil the sense of dignity.

At Auray is a very ancient structure in this old style. It shows wonderful and faithful construction that makes one wistful in comparing it with the flimsy modern houses that sprout on the landscape like mushrooms in a night. Here is evidence of loving work put in long, long ago. It is a house and shop in one, and it is quite evident that the old merchant loved to build it, ornamenting the great sturdy beam ends with rich carvings and following out his own fancy, observing no rule of architecture but bringing about an originality that may never be seen again.

At Armentieres is one of the oldest half-timbered houses, erected more than three hundred and twenty years ago, and appears to be good for one or two more centuries, if not longer, as it is still in a fine state of preservation and in use both as a home and a shop. It is very simple in design but extremely interesting in line and color, and there is a certain novelty displayed in the arrangement of the timbers.

In the old city of Nantes is a picturesque old corner adorned with a very interesting group of half-timbered houses that run back from the angle of both streets. This old corner has genuine architectural beauty. It reveals an interesting method of building in which the supporting timbers are left exposed. There is a strong fine pilaster at the corner, supporting the deeply projecting upper story, and this, while not being carved, is gracefully molded.

At Lisieux there are two old houses, one a very ancient building in the half-timber style which is one of the most picturesque and attractive in France. No one seems to know just how old it is, but judging by its style and the condition of its timbers, experts give the structure three centuries. It has fascinating roof surfaces and a quaint tower-like projection very beautifully designed. The other old house is famous as the "Old Manor," also 300 years old and very much carved and decorated.

A half-timbered house at Rouen is strikingly effective. It has been somewhat reconstructed, so that the roof has a prosperous modern look, not quite in keeping with the closely timbered walls. It shows marked individuality and gives evidence of the character of its old builder having been very orderly and methodical.

These plaster and wood buildings were the delight of the first great French architects. Built according to the whim of the owner, about the end of the sixteenth century, and the beginning of the seventeenth, these structures are full of an individuality that may never again be operative in the architectural world, which is now given over to methodical plans and molds of definite shape and regulation. House plans were unknown in those old days in France, and so one got the real artistic feeling of the people and their artistic tastes were cultivated and encouraged. Dignity and beauty and variety were evident and people expressed these things in their daily lives in those days. Their homes were an expression of themselves and their shops a symbol of the strength and success of the merchant's power and progress.

Most of the town houses were built about many-angled courts, and because they wanted a good circulation of air, one end or the other of the house, according to the position, was made noticeably lower. This brought about a charming informality of design. Sometimes the entrance side of the court was little more than a screen wall. Again it would tower up into the air in steep-pitched irregularity of roof, cut into gables of many heights and broken by curious lucarnes or dormer windows.

Those Coaching Days Were No Joke

Although Mirth Was Mixed With Misery in the "Good Old Times"

By RALPH E. DAVIS

OUR ancestors who traveled in the old stagecoaches were a hardy lot. Patrons of the old stage lines will be found deserving of fullest sympathy after comparison of the conveniences offered then with the comforts of modern transportation.

Back in the early days of coaching, certain members of the sixteenth-century citizenry declared that coach riding would "soften" the travelers who "used to ride horseback with swords, belts, pistols, holsters, portmanteaus, and hat cases, wearing one suit of clothes and carrying another for use at the journey's end, and who endured frost, snow, and rain." It was venomously asserted that coaches dammed the streets, hindered the farmers in bringing victuals into town and crowded the townspeople against the shops.

It is difficult to believe that anyone ever actually felt *softened* by experiencing a ride in one of the old coaches, particularly if the coach was crowded and followed a rough road.

A clear picture of early traveling in this country is contained in a diary dated 1795. The writer was in the throes of a journey from Philadelphia to Baltimore: "The vehicle was a long car . . . the interior held nine passengers and a tenth was seated by the driver. A light roof was supported by eight slender pillars. Three large leather curtains suspended to the roof, one at each side and one behind, were rolled up or lowered at pleasure. There was no space for baggage, each person being expected to stow his things as best he could under his legs or the seat. The entrance was in front, over the driver's bench. Of course, the three passengers on the back seat were obliged to crawl across all the other benches to get to their places. There were no backs to the benches to support and relieve us . . . A mere strap behind the seats would have been a great comfort, and the ponderous leather curtains, which extended the whole length of the wagon, would have been more convenient divided into two or three parts, with a glass, however small, in each division to give light to the passengers in bad weather and enable them to have a glimpse of the country. The disposal of the luggage was also extremely incommodious, not only to the owner but to his neighbors."

Although some patrons of the coaches went on record as describing their journey as "altogether satisfactory," nevertheless these same accounts divulge that even in the brilliant age of coaching a trip in a coach was a rigorous undertaking, more so in times of bad weather.

An individual making his first land trip in 1831 admitted that he was so foolish as to think his Hoboken stage would carry him all the way to Albany, but learned differently two hours after the start when the vehicle was turned around at Hackensack, leaving the passengers to shift for themselves. "After waiting an hour we were sent forward, two in an open chair, four in an open wagon, and the remaining eight in a common farming wagon, all without covers. It now commenced raining, and by the time we got to the next stage, we looked like moving pillars of salt, our hats and coats being covered to the thickness of an eighth of an inch with ice transparents. At Goshen we changed the mail, thawed our garments and ate our dinner. As we got north, the sleighing got better, so we were accommodated with a covered box and runners, but alas! it was like the man's lantern without a candle. The cover was of wood boards placed a quarter of an inch apart without paint, leather, or canvas to protect them from the elements.

Day mails in England, 1838

"We traveled all night. The rain and snow descended through the roof, our hats were frozen to our capes, and our cloaks to one another. In the morning we looked like a mountain of ice moving down the Gulf Stream . . . this is what the horseflesh fraternity in New York advertise as their *cheap, safe, comfortable,* and expeditious winter establishment for Albany."

Our heartfelt pity must go out to the lady travelers mentioned in the following excerpt. And hats were *such* a prized possession! "We arrived in Boston at sundown . . . The ladies' hats and frocks which had shewed colors enough to have bedecked fifteen rainbows were now one, namely, ashes on ashes, and dust on dust."

The taverns along the wayside must have afforded the greatest symbol of cheer to the weary travelers. They must have looked forward anxiously to each opportunity for stretching their sore limbs, removing dust and quenching their thirst and satisfying their appetites.

The hostelry, providing entertainment for traveler and townsman alike, was indispensable. In fact, many of the Colonies ordered by law that each community should have some kind of public house. The coach and the tavern were staunch allies. On a fifty-mile turnpike out of Albany there were located fifty-two taverns, but even this seemingly large number was insufficient to meet the demands of the great westward movement which followed the Revolutionary War. A hundred horses hitched in front of the tavern was no uncommon sight.

The schedules followed by the old coaches obliged the travelers to observe most disagreeable hours. The truth of this was feelingly set forth by an individual making a trip in 1829: "The nominal hour of starting was five in the morning; but as everything in America comes sooner than one expects, a great tall man walked into the room at ten minutes before four o'clock to say that it wanted half an hour of five: and presently we heard the rumbling of the stage coming to the door upward of thirty minutes before the time specified . . . As the morning was fine we might have enjoyed the journey much. . . ."

Indeed, it must have been enjoyable to have had to travel four, five or six hours in the morning before breakfasting. It must have been still more fascinating to have had to ride miles in the darkness without even being able to see or know who your immediate neighbors were. One suspects that the coach drivers were not a trifle knavish in arousing their passengers at such inconsiderate hours, and there is even more of a suspicion of collusion between the coachmen and innkeepers attendant to the manner in

which diners were dragged away from the meals before they had hardly begun to eat! Nevertheless, these things all added in some way to the picturesqueness of the coaching days.

On the more important lines, often as many as a dozen coaches departed in the same company. Coaching was attended by class distinction between the travelers, which was shown in the superiority with which passengers of the "fast, flying mails" regarded the persons who rode in the three-miles-an-hour wagons. The coaches themselves had their haughty "insiders" who paid full fare and its brave "outsiders" who must needs hang precariously to the handles on top.

There was vast rivalry between the drivers and owners of the various stages, which spirit extended to the passengers as well. Frequently foolhardy racing to beat time records resulted in such a disaster as an overturned vehicle. The speediest vehicle of 1785 was the famous Bristol Mail Coach, operated in England, and making eight miles an hour.

A coach passenger of about 1800 wrote enthusiastically: "We were rattled from Providence to Boston in four hours fifty minutes. If anyone wants to go faster, he may send to Kentucky and charter a streak of lightning."

This traveler's opinion apparently did not coincide with that of a young man bound from Boston to see his sweetheart in New York. (Naturally he would feel some degree of impatience at delay.) "The journey took a week . . . One pair of horses carried the stage eighteen miles. We generally reached our resting place for the night (if no accident intervened) at ten o'clock, and after a frugal supper went to bed with a notice that we should be called at three in the morning. Then, whether it snowed or rained, the traveler must rise and make ready by the help of a horn lantern and a candle, and proceed on his way over bad roads, sometimes with a driver showing no doubtful symptoms of drunkenness, which good-hearted passengers never failed to improve at every stopping place by urging upon him another glass of toddy. Thus we traveled, sometimes obliged to get out and help the coachman lift the coach out of a quagmire or rut."

In time of wet weather, the vehicles often sank to the axletrees in mud. One instance is reported in which a coach was thus stuck and the driver called on the passengers to assist in getting it out. They declined, however, so the driver simply walked to the roadside and sat down, declaring that he was going to wait until the mud should dry. Needless to say, he wasn't compelled to tarry long for help.

The closeness of association in stagecoach travel naturally made fellow passengers companionable. Emerson has presented an amusing example of typical conversation that was exchanged in this instance between a sharp Yankee woman and another wearing mourning:

"Have you lost friends?"
"Yes, I have."
"Was they near friends?"
"Yes, they was."
"How near was they?"
"A husband and a brother."
"Where did they die?"
"Down in Mobile."
"What did they die of?"
"Yellow fever."
"How long was they sick?"
"Not very long."
"Was they seafaring men?"
"Yes, they was."
"Did you save their chists?"
"Yes, I did."
"Was they hopefully pious?"
"I hope so."

On another occasion a young man and a young lady were cast together in a coach. He was immediately attracted and debated with himself about becoming so bold as to address the pretty stranger. The coach took on another gentleman passenger who was likewise attracted, but who hesitated not in making love and pressing a proposal of

One of the "insides" sends out his S O S.

marriage, which the young lady begged to take under advisement for a week. Some parents, however, would not permit their daughters to travel in the coaches unescorted.

To be sure, the travelers fortunate enough to be riding in a coach with windows enjoyed more of the scenery than the passengers in the fast trains of today. During those early journeys they had ample opportunity to become well acquainted with nature, although the small window space frequently hampered sight-seeing. And there was always more or less of a likelihood that the party would happen upon the body of some executed criminal suspended by chains from a tree.

Ardent devotees of coach travel clung to the old system even after the early steam locomotives proved that up-and-going persons could no longer afford to travel at the terrific coach pace of "eight miles an hour." The objections against the establishment of the railroads far exceeded those raised against horse-drawn coaches centuries previous. Terrific speed would cost many lives; sparks would cause fires; the farmers would be ruined and even the chickens would stop laying eggs, it was alleged. One wealthy patriot of the coaches threatened to finance a new coach line when it was rumored that a railroad was to enter his community.

Doubtless the opposition failed to realize that according to the law of progress it was inevitable that the drivers, sitting erect and managing their four or six with grace, must give way to the locomotive engineer.

One can scarcely help being touched by the reflections of the father of the immortal Sam Weller who had the double experience of driving a coach and riding over the rails. "I consider that the rail is unconstitutional and a inwader o' privileges," he asserted. "As to comfort—vere's the comfort o' sitting in a harm-chair, a-lookin' at brick walls, never comin' to a public 'ouse, never meetin' a change o' no kind, but always comin' to a place ven you comes to vun at all, the werry picture o' the last! As to the honor and dignity o' travelin', vere can that be vithout a coachman, and vat's the rail to sich coachmen as is sometimes forced to go by it, but a outrage and a insult! And as to the ingen, a nasty, wheezin', creakin', gaspin', puffin', bustin' monster always out o' breath, with a shiny green and gold back like a onpleasant beetle; as to the ingen as is alvays a pourin' out red-hot coals at night and black smoke in the day, the sensiblest thing it does, in my opinion, is ven there's somethin' in the vay, and it sets up that frightful scream vich seems to say, 'now 'eres two hundred and forty passengers in the werry greatest extremity o' danger, and 'eres their two hundred and forty screams in vun!' "

Another sang the glories of the mail coach thus: "Modern modes of traveling cannot compare with the old mail-coach system in grandeur and power. They boast of more velocity, not, however, as a consciousness, but as a fact of our lifeless knowledge, resting upon *alien* evidence."

Doubtless the protagonists of coaching would have been not a little awed if they could have glimpsed at the time, barely a century in the future, when American ingenuity for fashioning four-wheel vehicles was to find new and unexpected expression in the making of motor cars.

BIRTHPLACE OF JOHN BURROUGHS. (*Article on page 4*)

CHRONICLER OF THE NEGLECTED TRUTH

BRIEFLY TOLD

Red, the traditional danger signal, kept its lead as the most easily distinguished from other colors at a distance in recent daylight tests of the visibility of traffic signals. Next in order came green, blue, and yellow.

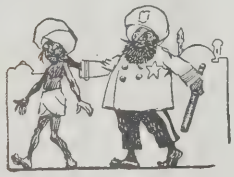
A novelist, Maurus Jokal, is figured on a new stamp issued by Hungary.

The Tropics contain some 240 million cocoanut trees, which bear an annual crop of seven or eight billion nuts.

A new illuminating gas, which is said to be non-asphyxiating and to have double the heat value and candle power of ordinary manufactured gas, is said to have been invented by Dr. O. U. Bean, the inventor of the Bunsen furnace.

Buffalo heads for trophies are offered by the Biological Survey at $35 to $60 each. Robes suitable for rugs or coats cost from $40 to $80, depending on the quality.

Demosthenes, the great orator, in his youth stuttered and stammered.



Shanghai is policed by black-bearded, be-turbaned men from India.

Certain tropical fish belonging to the puffers and porcupine fishes of the Philippine Islands are poisonous, due to the presence in various parts of their bodies of a substance chemically similar to the deadliest of the mushroom poisons.

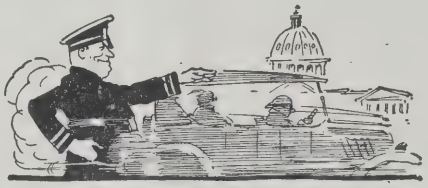
"The hurry, bustle and incessant drive of the American temperament is responsible for the peculiar and characteristic American mortality increase during the 'dangerous age' period, between 40 and 50 years," says Dr. William S. Sadler, nationally known physician.

Horses introduced into the Southwest by the Spaniards escaped from the old Spanish missions, multiplied rapidly, and virtually became wild, ranging over Nevada, California, Utah and Idaho.

The Mediterranean fruit fly, a dangerous insect that ruins all kinds of fruits, is now established on every continent except that of North America.

No part of the earth is too hot for the production of wheat if the climate is not too humid.

Milton, the blind poet, was seven years completing his "Paradise Lost," and he and his widow realized but $300 on the work.



To facilitate the movement of traffic, and as a safety measure, the city of Washington has raised the speed limit for automobiles from 18 to 22 miles an hour.

A letter from Robert Louis Stevenson, addressed to Queen Liliuokalani of Hawaii, was recently found among documents seized with the queen's private papers thirty years ago.

Paid guides may become a thing of the past in the United States Capitol as there have been charges that tourists who did not hire them were unduly importuned.

Until the outbreak of the World War one of the original cedar of Lebanon groves mentioned in the Bible was still standing at the head of Kedisha Valley near ancient Lebanon.

An experimenter in a balloon reports hearing a man's shout at 1,600 feet; the croaking of frogs in a marsh at 3,000 feet; the roll of drums and music of an orchestra at 4,500 feet; church bells tolling at 5,000 feet; a rifle report at 5,900 feet; the noise of a moving train at 8,200 feet, and the whistle of a locomotive at 10,000 feet.

When Imhotep, "the architect of the King in Upper and Lower Egypt," was designing the beautiful temple of Zozer, 3100 B.C., the ancestors of King Minos of Crete were living in wattle-and-daub huts, making crude pottery and chipping stone, and the architect of Stonehenge had not yet seen the light of day.

By means of "peaceful penetration," the Chinese are gradually absorbing all business in Tahiti. A steady immigration from China, together with a heavy birthrate among those already in the colony, makes this possible.

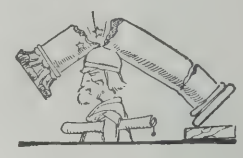
Professional ball players have caught balls thrown from the Washington Monument, which is 555 feet high.

Certain species of snakes are capable of climbing the rougher barked trees.

Certain African tribes scar the faces of their children with identification marks, that they may recognize them again if separated by slavery or war.

A Japanese in London raises goldfish in a small hatchery in his backyard. He feeds the fish butter and eggs and they command a high price because of their beauty.

The elevator was first known as the "flying chair," and originated at the summer residence of the Austrian emperor at Schönbrunn, in 1700.



The Pythagoreans were bound together in a brotherhood. They were taught to restrain their passions, especially that of anger, and to endure with patience all kinds of suffering.

There is no single capital of South Africa, owing to the fact that, at the time of the Union, Dutch and British jealousy made it imperative to establish two capitals, one at Pretoria, one at Cape Town.

More divorces are granted during the fourth year of married life than at any other period.

The great stone image of Gomateswara on the sacred hill of Scravanbelgola, Mysore, India, is bathed every fifteen years with a sacred liquid consisting of milk, curds, and sandalwood oil, which is sold by auction, as much as $10,000 being paid for the privilege of pouring the liquid over the head of the image from a scaffold built above.

Gooseberry has no connection with the goose, but should be gorseberry, or rough-berry.

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

Presented in This Issue:

Mr. Ford's Page this week enters into the distinction between that which is "practical" and that which is visionary." (p. 11)

It appears that "passing the buck" to our children and to our children's children in matters financial has become a fine art these days. It is even asserted that we are enjoying benefits to which we have no real right, and for which our children are paying and will have to pay. Once upon a time every generation was self-sustaining and did not shirk its burdens. (p. 2)

Why should it cost as high as seven times as much to sell an article as it does to make it? Few realize the big difference that there is in the cost of some article they are using and the price of manufacturing it. There is something wrong with a system which makes the "cost of selling" so very high. This and similar questions are discussed by Allan L. Benson. (p. 3)

The memories of John Burroughs that have been passed on to us by his friends are of the most pleasant and intimate character as a rule, but there are many aspects of the lives of celebrated men that escape even the observation of those who have known them best. Some delightful glimpses of the great naturalist, and some sidelights on his character and his engrossing activities, are afforded by Dr. Clara Barrus. (p. 4)

Why should coal worth $4.50 a ton be sold for as high as $22? There is something wrong somewhere. Should the government take the matter in hand? Huston Thompson tells us all about it. (p. 6)

America has for a long time been identified with the "American Beauty" rose and such varieties as the "General MacArthur." All rose growers will be interested in this talk on roses. (p.8)

It is asserted that Americans burn their candles not only at both ends but in the middle as well. This has been defined as "Americanitis." The cure for this malady is the woodlands and lakes and streams and mountains; afloat and ashore where the Divine gifts are greatest. (p. 12)

Scientists generally assert that the dinosaur antedated man on the face of this earth. But this assumption has received a rude shock by certain discoveries in Southwestern Arizona. (p. 16)

Do the best baseball players make the best managers? It seems that this is not always so. The high standard which they themselves have set they look for in others, with the result that there is sometimes a lack of sympathy between the teacher and the taught. An entertaining chat on a number of prominent figures on the baseball field explains many things. (p. 18)

The mentality of John Wilkes Booth and his antecedents, and how far this affected the tragedy which ended Lincoln's life, form an appealing study. Others of this family, besides the assassin, were to a large extent governed by a peculiar mentality. F. L. Black lets in much additional light on this matter. (p. 20)

The quaint old town of Duxbury, New England, forms one of those links with the past which add a great deal of charm to the present. There are sermons in its stones, and volumes of picturesque writing in its clams and coves and sailor men, not to mention its historic associations. (p. 20)

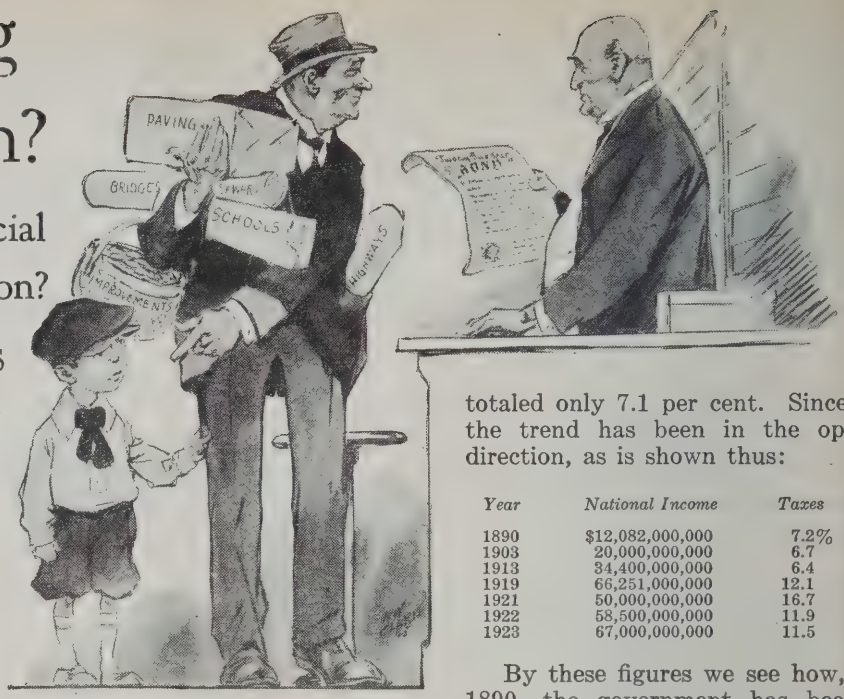
The Walled City of Manila in the Philippines is a long distance away, but it is a place which holds much interest not only for Americans but for all who love to explore the out-of-the-way spots of the world. Its past is written in its architecture. (p. 32)

Are We Living Off Our Children?

Should We Pass On Our Financial Burdens to the Rising Generation?

By RUSSELL BYRON WILLIAMS

ILLUSTRATED BY W. W. CLARKE



NO—we are not living off our children in the sense that we depend on them for our everyday requirements of meat, coffee or shoes. But we are more and more obligating our children with indebtedness for the municipal, state and Federal pleasures we have today. When we float a bond issue to pay the cost of a war, defray the expenses of a soldier's bonus, build roads or dredge rivers, we are living on money borrowed from our children, for they are the ones who will have to retire those bonds.

If you walked into a clothing store, outfitted yourself with a suit of clothes at a cost of $100, then said: "My son here, who is four years old, will pay for this suit when he is 24 years old"—you would be doing personally what you do when you permit your legislature, your county board or your city council to walk into a "good roads" store, order a thousand miles or so of concrete highways, then say to the bankers who advanced the money: "This loan will be paid back in twenty years"—knowing full well that in 20 years your sons, not yourself, will be footing the bills.

To just what extent we have obligated ourselves with debt is best shown by the figures recently compiled by the National Industrial Conference Board. They, better than anything else, reveal the extent to which we are living on borrowed capital. While our national wealth has increased 72.2 per cent during the ten years from 1912 to 1922, our total indebtedness increased almost 300 per cent. In terms of dollars, the increases are as follows:

National wealth:	
1912	$186,299,664,000
1922	320,803,862,000
Net total indebtedness (municipal, county, state, federal):	
1912	4,850,862,000
1922	30,845,626,000
State indebtedness:	
1912	345,942,000
1922	935,544,000
Counties, cities, villages:	
1912	3,475,954,000
1922	7,754,175,000

History shows there to be three distinct stages in the financial status of every empire. In the first stage tax receipts balance expenditures; in the second stage bills are paid by borrowing, and in the third stage bills are paid by issuing paper money. The United States is just now leaving the first stage; France is nearly through the second and Germany has almost completed the third. When the final stage has been passed, the nation is bankrupt, as is the case with Russia, Poland, Austria, and some of the smaller European principalities.

Time was when our taxes paid our governmental expenditures and left a little surplus—when our government lived within its income. The reverse is true now, due in large measure to the heavy bonded indebtedness. In 1890 our taxes amounted to 7.2 per cent of our national income while our governmental expenditures totaled only 7.1 per cent. Since 189 the trend has been in the opposit direction, as is shown thus:

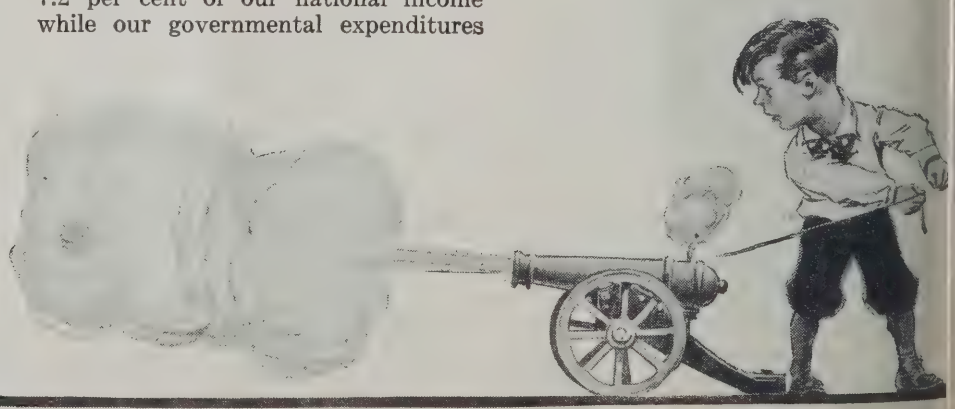
Year	*National Income*	*Taxes*	*Expen itures*
1890	$12,082,000,000	7.2%	7.1
1903	20,000,000,000	6.7	7.7
1913	34,400,000,000	6.4	8.5
1919	66,251,000,000	12.1	23.4
1921	50,000,000,000	16.7	20.5
1922	58,500,000,000	11.9	16.5
1923	67,000,000,000	11.5	15.0

By these figures we see how, sinc 1890, the government has been de veloping the habit of spending fro one to ten per cent more than th governmental income. Only by go ernmental divisions, however, do th figures reveal the real reason why ou taxes no longer cover our total gover mental expenditures. The followin table shows that except for the wa period, which greatly increased th national expense, the blame for th discrepancy between governmental i come and outgo can be laid at the do of the state legislatures, the count courthouses, and our city halls.

Year		*Taxes* (in millions of dollars)	*Expen itures*
1890	Local	405	487
	State	96	11
	Federal	374	291
1903	Local	706	913
	State	155	182
	Federal	521	487
1913	Local	1219	1844
	State	307	383
	Federal	668	692
1919	Local	2395	3557
	State	570	640
	Federal	5069	11333
1923	Local	3601	5139
	State	892	1450
	Federal	3223	3459

A study of the above figures w show that our state and local gover

(*Concluded on page 29*)



The High Cost of Selling—and Buying

Why It Costs So Much More to Sell Some Things Than It Does to Make Them

By ALLAN L. BENSON

Too many persons are engaged in adding to the expense of commodities without adding to the value of them.

Middlemen often add expense without adding service.

No one whose labor adds nothing to the worth of an article should be permitted to add anything to its retail price.

T costs a lot of money to be a boob. We have to be told over and over again—times without number—to o certain things that we should do ; once if the messages could get rough our skulls at the first attempt. costs money to keep up the bom-ardment upon us, and we pay the ill.

You know everybody likes music. he lowliest savage will have music en if he has to beat it out of an old ttle. It would, therefore, have emed a fair conclusion, when the nonograph was invented, that there ould be no trouble about selling it. he phonograph would not make but would reproduce music; the people anted rhythm, melody and harmony —what was to prevent product and onsumer from speedily getting to-gether?

Taxing the Boobs for Waking Them Up

Nothing except the inborn boobery of man. He had to be told a million mes or so that music for his soul waited only his money. The telling as done in a variety of ways, in agazine pages, in show windows, in lesrooms, every one of which cost oney. Of course, it is perfectly fair charge boobs for waking them up, the cost of *selling* was added to the ost of *making* the phonographs and the ill was sent to us.

What does it cost to sell phono-aphs? Guy E. Tripp, chairman of te board of the Westinghouse Electric ad Manufacturing Company tells us. *costs seven times as much to sell onographs as it does to make them.* ut this record on your machine and ay it. Divide what you paid for your achine into eight parts. One part what it cost to make it. The other ven parts are what it cost to force e idea into your head that you would happier with a phonograph. These gures are probably not strictly ac-crate, as applied to a given type of achine. Mr. Tripp gave them only the figures for the industry. But tey are close enough to give you mething real to think about.

Passing over to the furniture sec-on, we find something that it should st little or nothing to sell. Furniture not like phonographs; it is not mething of which the world never ard until a few years ago. We have en sitting in chairs, eating from bles and sleeping on the sofa with r boots on for a long time. Yet it is azing how little space the subject furniture occupies in our thoughts, ter we have made the first dash from te scene of the wedding ceremony to te installment store and signed a ntract to pay a dollar down and a dollar forever. Years and years go on but the same old stuff stays in the same old place. It is not until some honored guest breaks a leg off a chair and lands on his ear that we say to ourselves that the thing can go no further—that we must have some new furniture. We decided to make as nearly as possible a clean sweep of the premises and get everything new. The dining room table, too, must go. No wonder furniture manufacturers complain. At any rate, Mr. Tripp informs us that it costs five times as much to sell furniture as it does to make it. Divide the cost of your chair, table, or whatever it may be, into six parts. One part is what it cost to make it. The other five parts are what it cost to get you to pay attention to the wife's long years of razzing and become respectable again.

When a Watch Goes Up in Value

According to Mr. Tripp it costs six and one-half times as much to sell low-priced watches as it does to make them, three and a half times as much to sell washing machines and electrical merchandise, and five times as much to sell the milk, vegetables, and fruits produced by New York farms.

What are we to deduce from all of this—that human beings are intrinsically fools? Not at all. We shall be justified in deducing many things, the first of which is that we are living in a world of wonder that is moving so rapidly we cannot keep up with it. In such a world, it is inevitable that the cost of selling some things shall be much more than the cost of manufacture. We being individually and collectively what we are, it seems to be the price we have to pay to go ahead.

Inventions like the phonograph, for instance, are made overnight and offered to us the next morning. The inventors themselves sometimes do not know what their inventions are good for, or whether they are good for anything. The phonograph lay dead in Edison's hands for 15 years because he first tried to put it out as a mechanical substitute for a stenographer instead of as a reproducer of music. It came to life only when some of his own employes, during a noon-hour, sang into it, thus making records, and seemed pleased when they heard their songs come back to them. This slight circumstance set Edison's mind to work again and he made the phonograph a success by using it to reproduce music. Something similar happened in the case of the radio. The "wireless telephone" lay dead for ten years until broadcasting suddenly revealed its tremendous possibilities.

Now what have such facts to do with the relative cost of manufacturing and selling an article? A very great deal. The cost of manufacturing an article is not the mere cost of making and assembling its component parts. All of the experimental work that preceded production must be paid for. This means that the cost must be charged to the product and included in the retail price. The retail price must also include the cost of equipping a plant for the production of the article. The manufacturer naturally wants to recover as quickly as possible the sums that he has advanced for experimentation and equipment and therefore his first price is high. He has to make it high because he does not know how long he will be able to sell his product. The demand that he is able to create by advertising may die out after a little while. Also, competitors may devise something better and drive him out of his own market. Even if he be not driven out, he may have to junk his machinery and install new equipment with which to make the improved product.

We have mentioned competitors. This brings us to the consideration of what we may call the cost of competition. Competition has its uses in stimulating endeavor, but it also has a very bad side. The bad side is the waste involved. When it costs seven times as much to sell a thing as it does to make it we may be sure there is somewhere great waste. What is the waste of competition? It is the cost of the struggle among manufacturers to determine which of them shall get the profit from a sale to you. You do not care who gets the profit, but you pay to enable someone to get it. You pay because the cost of selling is added to the cost of making to get the retail price.

It Is the Same With Food

We are often told that we are a very wasteful nation and that the French could live from our garbage pails. We are waste-

John Burroughs as I Knew Him

The Man Who Loved "All Things Both Great and Small," and Studied Them

By DR. CLARA BARRUS

This is the first of a series of intimate sketches of the great naturalist.

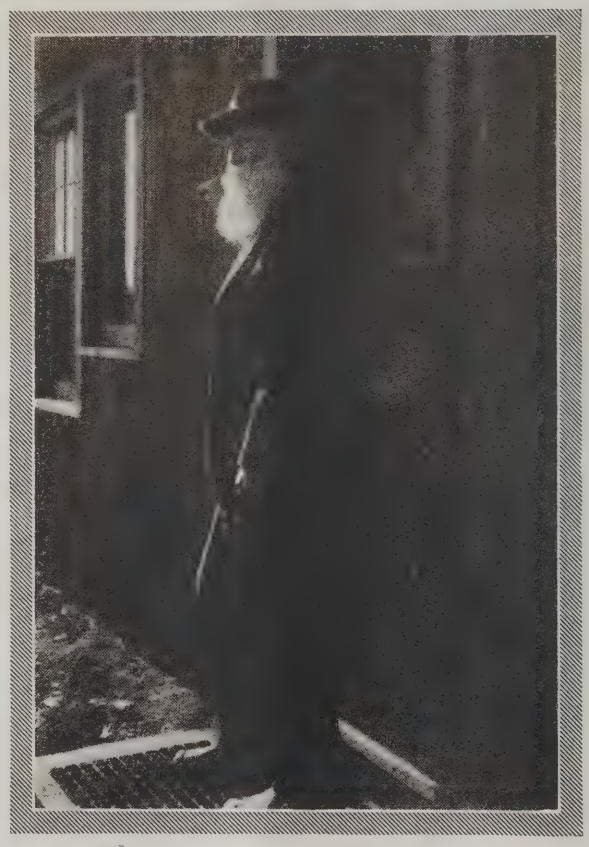
As straws show which way the wind blows, so what one loves and reveres, and shuns and abhors, give an index to his character. In a mere glance at some of the likes and dislikes of John Burroughs, no portrait is attempted, but simply a sketch that should catch and preserve certain aspects of a many-sided personality.

There were certain names which Mr. Burroughs always uttered in a reverential tone—Christ, Socrates, Kepler, Wordsworth, Carlyle, Emerson, Darwin, Whitman—a grouping which, in this connection, may well account for the breadth and catholicity of his mind.

Nature, literature, and science were the liberating influences of his life. He was also highly susceptible to music, poetry, and architecture. The overwhelming effect which St. Paul's Cathedral had upon him, on his first European trip, may be recalled by his reader. Architectural bridges always fascinated him. In fact, he was interested in construction work anywhere. He would stop in the streets of New York and watch such work with keen interest. Once in the Hawaiian Islands he stood and regarded some Japanese stonemasons at their work for a long time, and on resuming his walk spoke enthusiastically of the care with which the little men handled the lichen-covered stones, that every bit possible of the greenish-gray lichens should be preserved. "Oh, that reverence for beauty, and that painstaking honesty in their work—if only our laboring men had more of it!" he sighed.

He sighed just as feelingly at the lack of simplicity and sincerity in the men whose houses are built by the laborers. The pretentious and the ornate, how they displeased him! and, too, if a structure were not in keeping with its surroundings, its beauty was lost on him. I have heard him regret that the Gould Memorial Church in his native place (Roxbury, New York) was not more in harmony with its environment. "It is a bit of Fifth Avenue set down here in our plain little village." A building erected of the old Devonian rocks in which Roxbury abounds, perhaps hewn from the very ledges around which he and Jay Gould had played as schoolboys—he might have grown enthusiastic over that, while the handsome church of Scotch granite, and stained-glass windows left him cold.

The architectural features of the great Ashokan water system, and the "eloquent bridges," superbly simple, never failed to elicit his admiration; while he regarded the loveliness of the aeration plant with almost a religious fervor. Those myriads of fountains in which the water rises and falls in the sunlight, with the purpose back of it of purification, appealed strongly to him. That anything so utilitarian could be so lovely was to him the triumph of engineering. "It is as if a hundred veiled women were grouped there, ceaselessly performing some mysterious religious rite."



John Burroughs at his Chestnut bark study at Riverby, West Park, New York.

In his "Last Harvest," he laments his dwindling interest in poetry, and reminds himself that Darwin had a like experience; but really, the falling off was more apparent than real; or, rather, was often in the poetry itself, since he retained his love for the poets who had drawn him all his life, and, to the last, was quick to recognize new real poetry when he came upon it. The simple, inevitable beauty of Wordsworth and Tennyson always reëchoed in his heart. Their lines were often on his lips. Among the many I recall are these:

"The music in my heart I bore
Long after it was heard no more."

"Fair as a star when only one is
shining in the sky."

"And beauty born of murmuring
sound
Shall pass into her face."

"The little speedwell's darling blue."

"But what am I?
An infant crying in the night:
An infant crying for the light,
And with no language but a cry."

Long passages from Emerson and from Whitman he often recited, and he learned by heart many of the poems of John Russell McCarthy, to whom he became much attached in the later years of his life. He often quoted,

"So Tiberius might have sat,
Had Tiberius been a cat,"

after which he would descant on other animal poems of Matthew Arnold as the best in all literature. He was profoundly impressed with Robert Loveman's "Gates of Silence" and considered his "April Rain" a lyric which any of the major poets might have been proud to have written.

With all his catholicity of taste, and his approval of the poet who strikes out for himself, he had little use for the free-verse poets. Unfortunately one of these writers who flaunted his "dirty shirt" poem before the public attracted his attention by this and other bizarre things, while really poetic things by the same writer escaped his notice. Among his last essays was a brief protest in which he showed his disgust at the "Red of Literature."

As for science, which had drawn him early in life, it still drew him, and as his interest in it deepened, he saw more clearly the poetry in it also. Science might at first chill him; he might resent the materialistic trend it begot in him; but if he pondered it long enough, he was sure to see its wonder and beauty, just as sure as he was, in writing about scientific facts to throw around them the witchery of the ideal.

His love for persons, or for the wild creatures, or for domestic animals never blinded him to their limitations. He could even see the faults in the birds and chipmunks. When the robbins got so numerous they fairly became a plague, and stripped his

ees of all the cherries, he said he ished the law would let them have a w robin potpies in the South, so e could get a cherry pie now and then the North. When phoebe built on ie windowcap above his cot, on the eranda at Woodchuck Lodge (since ie harbored infinitesimal creatures, ong with her nestlings), he fore-alled her the next season, before she uld bring her nest to completion. o the wren, when tired of her chatter, would call imploringly, "Oh, Mug-ns, Muggins, do be still!" When the ioles ravaged his grapes, and pecked the bunches they could not eat, stroying their market value, the vine-esser countenanced e use of the gun to are them away. When lly Sally, his compan-n at Slabsides, studied nithology too assidu-sly, even to the most eticulous of feather-litting, and laying bare the dry bones of the bject, he did all he uld to thwart her from curing specimens for udy; and when she went the heaven where good ts go, vowed he would ver keep another cat. for dogs, he loved em mightily, and could e no wrong in them. it that "Clever Beast-" the chipmunk, much as he loved n, when he found him digging up the as he had planted, he did try hard to ake war on him; but soon got hicken-hearted" and let him have as to his stomach's content, and to at of those elastic cheek pouches, ile he gratefully took what few the pmunk left.

Affection for his kin seemed bound in everything pertaining to them. could not bear to destroy anything theirs. Once at the Old Home he nd in the yard an old bone-handled, o-tined fork protruding from the l. It had been his mother's. He cued it, scoured it up, and ever er preserved it. Old religious papers *he Signs of the Times*), which had en his father's, he treasured for rs. For years the old clothes that d belonged to his brother Hiram ng upstairs at Slabsides, and his hat on its accustomed peg. He ot Hiram's letters, and those of all kin, and of many of his friends. ecall how he once protested, and ly cringed, on seeing me throw into fire a beautiful letter from a nd, which I had just read to him. ow *could* you destroy such a letter! ve you no sentiment?" he asked rovingly.

His reader needs no reminder that had a *penchant* for homely, "shirt-eve English." "I like to break the es once in a while," he would say. ain, "I like to use words in a free, ible way"—this when I would become meticulous in pointing out the flies in the amber. He claimed the right to use a split infinitive, or to end the sentence with a preposition, if it best suited his purpose. I remember once questioning the correctness of the word "reapt" in his manuscript. To my query he replied that he did not know—had used it without thinking. So, in doubt, I consulted Webster, and to my chagrin found "reapt" sanctioned—the authority for its use being John Burroughs! (I think the citation was, "His sickle *reapt* the air.") And here I had been picking flaws with one whom the dictionaries quoted!

Taking a fleeting survey of the place of his birth.

Certain words of pleasing sound he rolled like a sweet morsel under his tongue, for example, "lyriodendron," "Unadilla," "April," "Willowemoc." In writing he had his own rhythmical cadences into which he fell naturally. Robert Underwood Johnson once said of him, in a poem, "His lines make rhythm and never know it." Countless passages in his books charm the ear by their limpid flow, as their clarity and beauty of thought charm the mind; they seem the audible translation of his emotions. This is less true of his poems than of his prose.

Apropos of his susceptibility to music, he could not sit still when old-time reels were being played, but would jump up and dance a breakdown with gusto. Some of the music of the great composers moved him by their eloquence, while folk songs and ballads touched his heart. Among his favorites were "Sally in Our Alley," "The Low-Backed Car," "Mary of Argyle," "Afton Water," "Loch Lomond," "Ben Bolt," and, toward the last, "Duna."

To spoken eloquence he was particularly susceptible. Beecher always put him under a spell. The eloquence of Robert G. Ingersoll was so compelling that he said, "I felt as if I could go home and do it, too—just as when I heard Ole Bull play the violin, I thought, 'By Jove! I can play the violin myself!'" For a short time he was taken with the oratory of William Jennings Bryan, but lost all interest when that gentleman "suspended the law of gravitation."

The noble eloquence and idealism of Woodrow Wilson's utterances during the World War were to him oases in the wide stretch of that desolation. He read them with suffused eyes, in a voice tremulous with emotion, and with fervent gratitude for such a leader. Once after the war, when looking at a picture of Generalissimo Foch, he exclaimed at the strength of the face which symbolized the intrepid spirit, and said with fervor, "I would like to touch the hem of his garment."

His dislike for that which he who runs may not read is seen in his scorn for "the absurd Latin names" for the birds. When in 1917 he was reading the proof of the American ornithological section in the Standard Library of Natural History, of which he was consulting editor, he declared, "There's no sense in it whatever." When one ventured, "But, for scientific purposes—for universal identification?" he rejoined testily, "No. I would go back to the common names. If the plain English of 'God,' 'home,' 'mother,' are good enough for these, it ought to be good enough for the birds"—an instance of his rash speech in certain moods.

His love for simplicity almost betrayed him into joining the ranks of the simplified spellers. He himself was a poor speller. There were certain words he could be depended upon to misspell. So when the devotees of spelling reform came after him, they received enough encouragement to enroll him, and send him notices of their meetings, and bundles of their "Literature." When defending himself for having given aid and comfort to them, he said: "Anything arbitrary always *was* hard for me. 'Musketo' is a good deal more rational way to spell the name of the little cuss than the way you do—that is why I want simplified spelling—all poor spellers want it." However, after enduring the influx of their pamphlets for a time he became rebellious and, as he consigned the latest supply to the fire (and craved the same fate for the senders of them also), said: "Tell them never to send me their stuff again. They are a d-a-m-*n* nuisance, tell them; and *spell it that way*. Besides," he added, with a twinkle in his eye, "their spelling is harder than the old way, after all."

Doubtless those who met Mr. Burroughs at dinners were sometimes disappointed at his unresponsiveness, for he was seldom keen about conversing at meals. He explained that his habitual silence at meals was the outcome of living much alone, as well as, when with others, *(Concluded on page 30)*

Putting the Lid on Profiteering

Will Government Deliver the People From the Ubiquitous "Frogs of Egypt"?

By HUSTON THOMPSON

Copyrighted by Huston Thompson, 1925. All rights reserved.

A FAMOUS New York financier is credited with having said before a Congressional committee, while discussing the impossibility of separating corporations after they had been once combined into a super-corporation, that "You can't unscramble the eggs of an omelet that have been scrambled." This statement insofar as it may be applied to trusts contains a vital truth. Theoretically combinations can be dissolved. In practice the dissolutions have seldom resulted successfully. How few corporations that have once been consolidated have been so separated as to restore competition between the original corporations!

So ineffective have been most of the efforts of the government that in the business world combinations and consolidations are rushed to the unscrambling stage with great energy and rapidity regardless of our laws. It is little wonder that some of our citizens behold this drift toward centralization of economic power and despair of keeping competition alive.

The Privileges of the Shopper

So long, however, as a nation has any vitality left there will be those who will fight against consolidations and combinations, whether held in loose or tight control. In fact, a nation's vitality can be measured by the number of its citizens who believe and continue to demand that a "shopper" has the right to hunt around for the best price and even to seek for bargains if he so desires in the market place, whether that shopper be a housewife or a buyer of steel, lumber, or flour.

Now the only way to keep the market place free for the shopper is to see to it that he or she is put on an equality with the seller. To do this there must be no secret or open combinations or the practice of unfair methods that will close the door to the shopper's opportunity.

If legislative action in the last twenty years is any indication, then the American shopper has been demanding through his representatives that the ancient doctrine of "let the buyer beware" (*caveat emptor*) shall be changed to "let the seller beware" (*caveat venditor*).

Could we summon the clerk, the housekeeper, the farmer, the small storekeeper and some representatives of our large business interests to the stand and ask them if they were in favor of competitive systems, they might be mystified by this phrase and not know how to reply. If we were to ask each one whether he was satisfied with having the same price quoted to him for the same kind of an article by the so-called competitors in an industry, or the ultimate consumer discovered that he had no control over the advancing or retarding of prices, except through a buyers' strike, his answer would be such a universal and emphatic "No!" that it might shock the business world into considering the drift of modern business.

> Do you know that the United States Government is legally stopped from investigating the coal situation?
>
> Since 1919 the Federal Trade Commission has been prevented by court injunction from finding out why coal worth $4.50 brings as high as $22.

This frame of mind of the ultimate consumer or buyer is no different from that of the peoples of the other nations, past or present. In fact, the world is strewn with the almost obliterated remains of nations whose people demanded the right to "shop around," but whose body politic became so corroded with the cancer of special privilege that the buyer had lost control of his normal right in the market place. So these nations disappeared off the face of the earth.

Our statute books also indicate that our people are not for Socialism, or its first cousin once removed, which can perhaps best be described as paternalistic governmental control, which special privilege, once intrenched, desires.

What Washington Said to Tobacco Buyers

Although that part of the public known as the ultimate consumer outnumbers all other groups by many millions in the United States, just because of the unwieldiness of numbers, he has not, except upon rare occasions and only when aroused by unusual conditions, such as a shortage and high prices brought on by concerted action, become articulate. So far in our history he has fought blindly and often ineffectually but with tenacity against the drift into combinations that destroy competition or control the prices of his necessities. From decade to decade his spokesman has hurled bitter language at these "forestallers" of the market place.

George Washington, prevented by the tobacco buyers of Alexandria from getting a competitive price for the product of his farms and also as a public official, stormed and fairly shouted his imprecations at them. Indeed, the man of today who dared indulge in such language as the Father of our Country would not last long before the public. His surname would be "Radical," "Red," or, perhaps, "Bolshevik."

In the eighties, the halls of Congress resounded with attacks on concentration in the business world by those who were then regarded as conservatives. This finally culminated in the passage of the Sherman Act in 1890, forbidding combinations and contracts in restraint of trade. Nevertheless, combinations and contracts continued to be made.

Birth of the Federal Trade Commission

Again in 1902 Congress, responding to the pressure of the people, created the Bureau of Corporations, giving it the power to investigate business organizations and their practices and report the same to the public and Congress and suggest remedies. It was hoped by Theodore Roosevelt and others that this exposing of the intricacies and unsettling movements of unfair combinations or "pests," as Washington called them, to the light of day, would halt their growth. Like the mistletoe, they continued to entwine the sturdy oak of our national existence with their parasitic growth. With subtle propaganda and "much fair speech" about efficiency, trend of the times, and reduced prices, they sought to lull the public to sleep, but they continued to block the channels of the market place until again in 1914 Congress, at the instance of Woodrow Wilson, who had been calling for business and economic freedom, put upon the statute books the Federal Trade Commission Act and the Clayton Act.

The purpose of these two laws was in a word, to add to the investigating, exposing, and recommending powers of the Bureau of Corporations the additional powers of calling business interests that were practicing unfair methods of competition or consolidating to destroy competition before the Commission at the very beginning of their acts. They were to be halted before their actions produced monopoly in the full flower.

The failure of the Sherman Act had led the public and the legislators to believe that this law only could be used when monopoly had arrived. In other words, it was the purpose of Congress to prevent the scrambling by stopping the actors before they had started to scramble the many co-

porations into one gigantic monopoly.

As the Federal Trade Commission nas been functioning in the business world, seeing that the channels of rade from producer to consumer were cleared of artificial and unlawful ob-tructions put there by unfair business n its efforts to defeat fair business, t has assumed much the same position is the traffic officer on our streets. It s his duty not to impede traffic, but o facilitate it and speed it on its way. Accidental infractions of the regula-ions do not initiate a penalty from him, nor does the size of the vehicle nor ts magnificence make any difference. Only when some one by his careless or premeditated act blocks the way does he lay on hands. So the Federal Trade Commission has, by investigations for Congress, by conferences with whole industries which it has assisted in liminating their unfair practices, and y the economic studies and investiga-ions which it has made, sought to dvise the Congress, the business world, nd the ultimate consumer of their ights and thus accelerate business.

The function of the Commission nay also be likened to that of an um-ire in a football game, who has been anded the rules of the national rganization and who overlooks the nimportant, immaterial infractions nd only penalizes where the act was ntended to be injurious to the op-onent or unlawfully blocked the right-il advance of the play.

The Commission has had in many espects the unenviable position of an rbitrator or umpire in a business rena where some of the competitors ave not yet learned to control them-elves because they have given more nought to prices and profits than to iving and service.

Moreover, the Commission has had function during the almost un-recedented moral slump which fol-lowed the war, not only in interna-tional but in the social and business life of most of the nations of the world.

Has Commission Justified Its Existence?

In the mad scramble for business here has been a sort of "devil-take-the-hindmost" attitude, which one will not find so accentuated under normal con-ditions. Men have not yet been able to learn what the war should have taught them—that only as our business competitor, or community competitor, or international competitor prospers as shall we prosper. Perhaps this is the step which these troublesome times are about to teach us.

The Commission has now functioned for ten years during which time I have often been asked whether it has really justified its existence. This question has not only been propounded by our own citizens, but by the representa-tives of many governments who have either come to the Commission's offices to study its functions and effects or have put the question to me when abroad.

On one side of the equation we have a marked growth in monopoly the world over: a market whose prices have sometimes become almost automatic in their advance and retreat owing to the control exercised over them through devices such as I have described at other times as guaranty against de-cline in price, resale price maintenance, secret price agreements, combinations in restraint of trade and associations controlling prices.

Speaking of Business Anarchists

But before it is said that the equa-tion looks too dark, let us consider the other side. First of all, the conditions which I have described are not only prevalent in the United States, but in the world at large. Hence, it is fair to assume that the world slump we are combating today is the backwash of the war, which has affected all walks of life. When the morale of the world starts back, we shall escape in great part at least from this.

Again some light breaks on the scene when entire industries, as I have al-already shown, come before the Com-mission of their own free will and voluntarily inform it of the unfair methods of competition prevalent in their industry and say that they are anxious to clean the slate and start over and that they cannot do so with-out the Commission's help.

Moreover, when, a few years back, the Commission's life was in the balance and it was being attacked so bitterly that it demanded an investigation of itself by Congress, and the request was granted, many organizations and individual corporations, against some of whom the Commission had issued orders, wrote letters to the Senate Investigating Committee indorsing the work of the Commission.

Despite the fact that a great deal of time and energy has been spent in fighting for its existence or to escape being so hampered that its efforts would be futile, the work of the Com-mission has repeatedly had the en-couraging indorsement of the leaders of great organizations like some great business concerns, the Consumers' League, farm and labor organizations, the League of Women Voters, and a number of the better type of trade associations.

Undoubtedly business in general will admit that in its short life the Federal Trade Commission has made a decided impression, if not an improve-ment, in opening up the channels of trade. For the last two years the Com-mission has had no jurisdiction over the packing business; nevertheless dur-ing the period of time when it was throwing the searchlight on this in-dustry, the Independents made a tremendous gain in competition with the Big Five Packers. From 1919 to 1924 the Independents increased their pro-portion of the total federally inspected slaughter from 30.7 per cent to 39.4 per cent, while the Big Five Packers' proportion declined from 69.3 to 60.6 per cent. During the year 1921, according to a report of the United States Department of Agriculture, the Big Five Packers lost sixty-one million dollars, while 165 Independents' com-bined operations netted a profit of nearly five and three-quarter million dollars. This was a precarious period for business but the figures show that even in such a time, with the market place carefully guarded, the Independ-ents not only survived but improved competitive conditions.

What business thinks of the Com-mission has often been revealed by letters which have come into its pos-session in the investigation of the files of many associations and corporations. Some of these letters have been bitter in denunciation. Others have been extraordinary in their indorsement. Many have revealed the fact that one of the most encouraging signs about business is that there is a fighting minority, and sometimes a majority, in every industry that is secretly or openly standing up for the law as against those who are business anar-chists. Some of the most courageous acts that have ever gone unsung in American life are those of American business men who have fought for the law in this mad modern scramble for sordid gain.

Occasionally the Commission has gone so far as to make public mention of their acts. If it were possible there might be created a public roll of honor to which, from time to time, could be added the names of those business interests that were supporting the government in its enforcement of the laws.

So, after all, the efforts of the Com-mission up to the present time have produced epoch-making, concrete re-sults.

There is still a question to be answered: Why has not the govern-ment's contest with monopoly been more successful?

The Government's Contest With Monopoly

For the answer it is necessary to go back to the source of our government —the people. So long as the public—the mass of the people, not their leaders—is prodded into action only on election years and during the four-year interim suffers its officials to meet the Niagara-like forces of those who "know what they want when they want it" in this material world of ours, monopoly will still exist. When the populace does not become articulate until its pocket nerve has been pinched by runaway prices brought about by the control of the necessaries of life, or seems to forget when sitting on juries that the blocking of the flow of food or other necessaries to and from the market place, or controlling them after they arrive, there is a deadly crime against the public welfare, special privilege will flourish and expand. Unless government

The Rose in America

By E. I. FARRINGTON

The Mary Lovett, an American-made climbing rose.

SOME years ago E. G. Hill, of Richmond, Indiana, visited a famous garden in England. The gardener was showing him the roses. Finally he stopped before a large plant covered with immense deep red blooms. "This," he said, "is General MacArthur, the finest red rose we have. Are you at all familiar with it?"

"Well, rather," replied Mr. Hill, "I originated it."

Later Mr. Hill met a man from South Africa. "Mr. Hill," he said, "do you know, the finest rose we have in our country is the General MacArthur from your gardens in America."

These two incidents emphasize a great change that has come about in the world of roses. There was a time, in the not-far-distant past, when practically all of the roses grown in America, as well as those in Europe, came from England, from France, or from Ireland, which until recently boasted one of the greatest rose-producing nurseries in the world. Even yet roses of European origin far outnumber those having their birth on this continent. But it is significant that many of the roses introduced by American hybridizers are already taking high rank in English gardens, and that constantly increasing numbers are being added to the gardens of this country.

Some enthusiasts are proposing as a slogan, "American Roses for American Gardens," but that indicates too narrow a viewpoint. The rose is a flower which belongs to all the world. There is hardly a country from Iceland to Australia that does not have its native species. It is right and just that each country should share its roses with all other countries, and certainly American gardeners would consider it a hardship were they deprived of the unrivaled productions of English, Irish, French, and Holland growers.

It was inevitable, though, that America should eventually develop roses of her own, for America is fast becoming a continent of roses. The American Rose Society, with its five thousand members, is one of the largest horticultural organizations in existence. Its test gardens range all the way from the Atlantic to the Pacific; its annual yearbook presents the last word about new roses and new methods in rose cultivation.

Nearly a dozen American cities now have municipal rose gardens. Thousands of dollars are being expended on such a garden, which was begun in Boston last season. In July of this year a municipal rose garden was dedicated at Syracuse, New York, and named for the Rev. Dr. E. M. Mills, a Methodist presiding elder, who has found time to organize a series of rose societies in New York State and to serve as president of the American Rose Society.

The newest American rose, the Mrs. Calvin Coolidge.

The principal municipal rose garden, and the one which has set the pace for all the others, was established in Hartford, Connecticut, in 1904, by Theodore Wirth, then the park superintendent, and now superintendent of parks at Minneapolis, where he is again serving the interests of garden makers by laying out a two-acre public rose garden. The Hartford garden, which is just off an automobile highway, attracts ten thousand persons from outside the state every year, and has visitors totaling eighty-five thousand each season. The Hartford authorities believe that their rose garden brings back a greater return in money to the city than is expended for its maintenance, besides adding beauty and pleasure to many a private home by the information it gives and the example it sets. Wherever a municipal rose garden is established, the planting of roses in home grounds for miles around immediately follows, until the whole section of the country becomes rose bedecked each spring.

The new Angelus rose.

Thousands of persons go to the Washington Rose Garden every year to see the new kinds which are planted there. Chicago has a formal rose garden in Humboldt Park, with seven thousand plants. St. Louis' model back-yard rose garden in the Missouri Botanical Garden disseminates information which is carried by bulletins throughout the country. Rochester, New York, and other eastern cities also have splendid public gardens, but it has remained for Portland, Oregon, to transform itself into what is literally a rose city. The streets of Portland are bordered with roses in double rows, mile after mile. The parks are fairly choked with roses, and every back yard is made gorgeous by their presence.

A year or two ago Thomas N. Cook, of Boston, well known as a hybridizer, presented the city of Portland with one of his numerous creations, a climbing rose, which is to belong to the city and be controlled by it. Portland has a powerful organization in the Royal Rosarians, and every June draws thousands of visitors by its Festival of Roses, when business is almost suspended in honor of the

EDITORIALS

4.4 in the "Foreign News"

RECENTLY the government of Ontario, in the face of a popular expression to the contrary, permitted the sale of beer in certain cities of that Province. That, however, is not the fact which is to be commented on here. A situation equally extraordinary was the great stir which it made in newspapers all along the border. For weeks before the opening day, Page 1, Col. 1 publicity was given without stint. The tone was glad and gay, as if at last the Kingdom of Heaven had come. The biggest papers sent their best men to write what facts they could find and rhapsodize on the rest. Readers of those papers, who look in vain for complete reports of a transaction in Congress, who search fruitlessly for adequate statements of what is transpiring overseas, who glean every two-line tidbit of information about foreign policies, found space galore given to Ontario's 4.4 beer! It was THE great event of international interest.

Meantime Ontario perhaps does not know what she has done to her ever increasing and lucrative visiting motor business. The roads were fairly safe before and tens of thousands of Americans spent their time and money enjoying the acquaintance of the excellent Canadians whose towns were such models of propriety and whose people are still uncontaminated by the less desirable alien elements. But there's many a car and many a family will no longer venture there. It is becoming almost a Constitutional axiom that the motor and the bar will not and cannot mix. Meantime, the United States border will be rid of those who still believe that life without liquor is worthless, and Ontario will have the cleaning up of the mess.

It will be interesting to observe whether the journals which were so enthusiastic for beer will follow closely and impartially its effects.

Here's a Hand for Indiana

IN our mental guide book we had listed Indiana as a state which takes politics with its meals, grows novelists and vice-presidents, exports newspapermen, raises limestone out of the ground for our city halls, libraries and school buildings; maintains two state universities and dozens of colleges; and wins an occasional world award for its school system. A good record; we had overlooked a bet. A bureau of public roads report shows that Indiana, thirty-seventh in area, ranks first among the states in miles of surfaced roads, and that she is exceeded only by Michigan in the miles of highways she is rebuilding into the good-roads class annually.

A Hoosier gives us a grin for our surprise, asks us if we knew Indiana also pioneered in developing the interurban electric line, and wonders if—maybe—there isn't some connection between all these things.

He is right. There is. Indiana is interested in folks; in what they learn, how they are governed, what they think. Three C's—curiosity, communication, contact—have been traditional. A struggle for good schools, good reading, good government, good roads—all of one piece. If Indiana has more good roads than any other state perhaps it is because Indiana is awake and going somewhere.

Manners in Road Signs

AN English countryside flows by and the motorist comes upon a quaint village in which, second only to the ivy-clad church in visibility, is a huge sign warning him to slow down to eight miles an hour. Nobody does.

How much better is the Yankee twist of mind that causes us to put up signs like these:

"Stop, look—and live."

"Look out, you may meet a fool around the corner."

"Don't speed: it is 'Good Morning Judge' here."

"Look before you weep."

"This is a good road: it will cost you money to burn it up."

New Jersey civic pride—and righteousness—coins this one: "Go slow and see our town: go fast and see our jail."

But our award goes to Peekskill, New York. On the strategically placed vacant lot where one looks for the town's warning we find a sign which reads: "This is Peekskill, a Friendly Town." Somehow we cannot picture ourselves driving recklessly there. And though we may sometimes smile at the bluntness of wit of some village fathers, their messages get home to us.

Americans Are Mechanical Geniuses

MUCH more intriguing to our imagination than the performances of a Matthews or a Miethe was something John Hays Hammond, Jr., America's prolific young inventor, pointed

out to us the other day. America, he declared, is becoming a nation of mechanical geniuses. Because America has pioneered in developing the electric light, telephone, automobile, airplane, radio, central heating, labor-saving devices and sanitary plumbing, the American has an understanding of mechanical principles and a mastery of operations such as can be approached by no other people.

We understand, accept, use, and know how to care for each new and beneficial invention. We are quick to absorb the good things science finds for us—for our greater comfort, for our amusement or for our enlightenment.

Better to have a hundred and ten million mechanical geniuses than one master of a "death ray" or a single maker of gold.

The Return of the Dance

THE dance is one of the oldest forms of human expression. Some have regarded it as a part of human speech. From the dance of atoms, through the mating dances of certain birds and animals, up to the tribal dances of the various nations, the expression of emotion and ideas in rhythmic movements of the body bears all the marks of being a deep natural instinct.

No aspect of human interest has escaped interpretation in the dance. From time immemorial marriage has been celebrated by dancing. The Coming of Spring has inspired several forms of dancing. The war dances of the Indians are commonly known. Many of our common games like "London Bridge Is Falling Down," "Ring Around the Rosy," "Round and Round the Mulberry Bush," the Maypole games, and the various circle games, originated as dances. Our Carols were originally round dances (since carol means circle) which people danced as they sang their Christmas or Maytime hymns. Dances and plays were once the same, the dance set forth the plot of the play. The ballet dance is so called from the custom of dancing to a ballad—an old story reciting some event, sad or dramatic.

Joy, of course, has been the most moving source of dancing. The lambs skip, the dog leaps, the pleased child dances about in ecstacy. The polka is said to have originated in a Bohemian servant girl's joyous steps, artlessly executed, upon receiving good news of her lover. But other emotions, too, have sponsored the dance. There are dances of solemn mien setting forth the more austere reactions to life, as when David danced before the Ark, or as now they dance on Corpus Christi Day in Spain before the altar. Religious dances are found throughout the world. Considerations of health were sometimes introduced, as when the Dance to St. Vitus was thought to be curative of nervous diseases and St. Willibrord's dance was held to heal the same ailment. There is probably a physiological and psychological truth underlying the belief that dancing has a tendency to allay nervous trouble.

A mode of expression so universal as the dance is known to be would naturally develop into an art. In some nations it attained the greatest vogue. The dance held the first place in modern opera until the singing of Jenny Lind drove it to second place. It is not at all likely that dancing will ever again attain the point of being a general social craze, or the prime theatrical event, commanding the ardent and constant devotion of all classes alike, but it is very likely to become more widely spread as a social diversion than ever before.

Denunciation of the dance by the protectors of public morals has usually been occasioned by the importations of dances which are foreign to the expressional needs of our people. Dances partake of the racial characteristics of the people who dance them. There have been imported into the United States of recent years dances that originated on the African Congo, dances from the gypsies of the South American pampas, and dances from the hot-blooded races of Southern Europe. Wave after wave of foreign importations in dancing styles have swept over the country. The result was a reaction against the excessive attention given to dancing, and a protest against the character of the dances themselves.

With characteristic American judgment, however, the balance is now shifting toward that style of dancing which best fits with the American temperament. There is a revival of that type of dancing which has survived longest among the northern peoples.

One fault which has scored heavily against the ultra-modern dance is its "one and one" quality. It begins and ends with a single couple. No more is necessary. The group spirit of fun is absent. This is due to the modern commercial dances. Their character is determined by commercial considerations. The older form of dancing requires room. Dancing that inspires the group spirit of fun requires room. Room in cities is expensive. Hence a form of dancing has been encouraged that enables the largest possible number of paying couples to dance together in the smallest possible space. The result is that in the modern method the movement of the dance is mostly above the feet. It is as a revulsion from these conditions that the ultra-modern dances are being abandoned.

MR. FORD'S PAGE

THE word "practical" first came into use as representing a much-needed quality—the capacity possessed by an idea or plan for working out in practice. It implied that antagonistic facts had been allowed for and provision made for surmounting or circumventing them. On the other hand, the word "visionary" was used in referring to an idea or plan derived from a "principle" having a pretentious but purely verbal existence.

At the start of the industrial era, it may be imagined, the application of the steam engine to the production of goods in large quantities, and more economically than had hitherto been possible, came to be regarded as practical in the highest degree.

But with the potency of its association with the first great instrument of modern industry clinging to it, the word "practical" was used to justify such smoke traps as the *Coketown* described by Dickens in "Hard Times." All speculation regarding the possibility of paying living wages and making *Coketown* fit for human beings to dwell in was shouted down as "visionary."

Everything dirty, unhealthy, and momentarily profitable at the price of unhealth and unhappiness for the many was pronounced "practical," indeed, for many years. Alleviation of the ruinous condition was looked on as purely a waste of time, money and pains. A manufacturer who ventured, about the middle of the last century, to correct the worst evils incident to production, was set down in the popular mind as a "philanthropist"—that word having come to designate a slightly senile and eccentric old gentleman who went about distributing unmerited aid to people lacking the self-respect necessary to refuse it. In the minds of other manufacturers he was something that called for a much harsher term. His expressed conviction that it was possible to produce goods under conditions neither unhealthful nor hideous caused him to be referred to by scoffers as a victim of "visionary" plans. Even today he is remembered for his "charity," rather than for his sanity and sense. Many people find it incredible that his method of putting his production on a sound basis could have been conducted except at the expense of gain.

From that time to this, the term "practical" has been applied to many a project which enlightened men would see to be antisocial, unjust and generally disastrous. And, along with a large number of wild schemes, a great many sane plans for making these projects self-supporting and efficient have been delayed or rejected because of the label "visionary" having been successfully hung upon them.

THE past century was the golden age of eloquence as it was the golden age of exploitation. This coincidence was not accidental. Masters of the first "explained" and "justified" the second. To a certain extent this is still the case.

The word "practical" is applied to schemes wasteful and profitable only to the few; "visionary" to plans that would make production sane and efficient. "Word magic" brings people under its spell. But this is passing. The stark Necessity that stands in the path of human progress is presenting a problem which can be met only by sound thought and efficient, productive action.

The potency of the word "practical" persists to a lesser extent at the present day. Injustice is still supported by it. On the other hand, thorough and sane efficiency is sometimes temporarily brought into bad repute by the repetition of the word "visionary." But this is passing.

It is passing because "word magic" is failing more and more to function effectively. And this failure arises directly out of the progressively stronger emphasis being put by the world on the capacity for *getting things done*. It is no miraculous coincidence that the increasingly obvious importance in the mind of the people of the man who thinks and *acts* is accompanied by a proportionate distaste for, or at least indifference toward, mere eloquence. The past century was the golden age of eloquence, as it was the golden age of ruthless exploitation. And the second was very often glorified by the masters of the first. But Necessity is ruthless. If a bridge must be had, it must be built; words will not reduce the size of the traffic stream. Oratory is no successful substitute for bread.

In the near future, it will come to pass that no repetition by the eloquent of the words "practical" and "visionary" will avail. Only efficient productive action will appease the stark Necessity that offers the abrupt alternatives, *Progress or Die*.

Motor camping.

A Cure for Americanitis

The Open Spaces as an Antidote to Strenuousness

By GEORGE W. SUTTON, JR.

OF all hard-living people on the face of the globe, Americans are, by a huge margin, the world's champions. We go to the most astonishing extremes. We are faddists, in our work, in our amusement, in practically everything we do. We burn our candle not only at both ends but in the middle as well.

And we pay a royal price for it.

One morning recently in the New York *Times*, an item stared us in the face from a little box on the front page. Here it is; it's worth reading again:

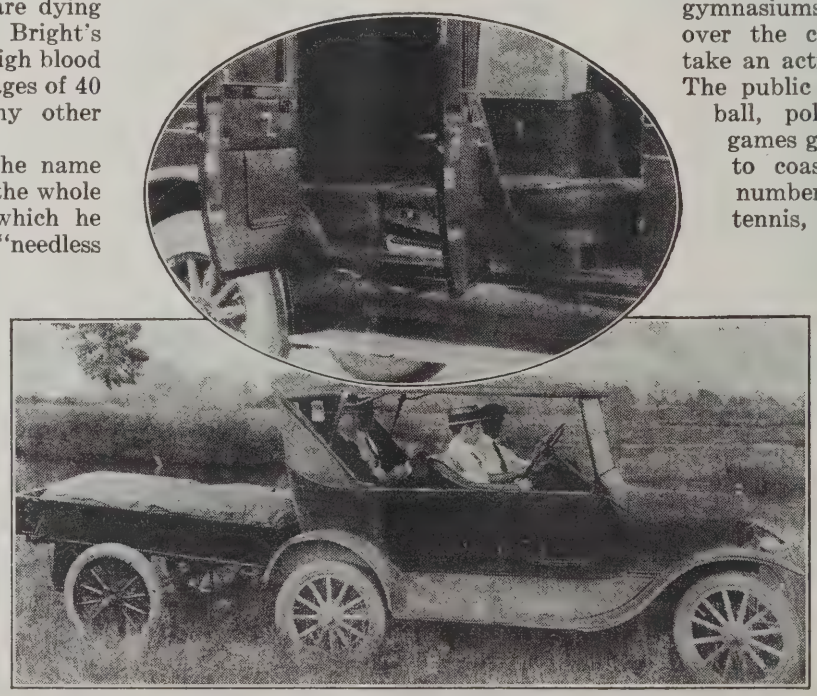
> Says 'Americanitis' Kills 240,000 Persons Here Yearly
>
> "Americanitis" is causing 240,000 preventable deaths yearly in this country, Dr. William S. Sadler asserted today in a report to the Gorgas Memorial Institute.
>
> The report is declared to confirm for the first time "the hitherto only suspected fact" that more Americans are dying from heart disease, Bright's disease, apoplexy and high blood pressure between the ages of 40 and 50 years than any other white people.
>
> "Americanitis" is the name Dr. Sadler applied to the whole group of conditions which he believes responsible for "needless loss of life."
>
> "The hurry, bustle and incessant drive of the American temperament is responsible for this peculiar and characteristic American mortality increase during the 'dangerous age' period between 40 and 50 years," reported Dr. Sadler.

True, every word of it. We die young. But no matter; we live fast. By the time we die we have accumulated the experiences of a long and rich lifetime. We crowd the normal activities of a month into the space of a hectic day and a still more hectic night. With us the deeds and accomplishments of an old-fashioned year are made to look foolish by the events we engineer in a short week.

And when we arrive at the one-third of a century mark our spirits, our physiques and our souls are aged 'way beyond their years. We have taken life like an orange, and, instead of cutting a little hole in it and drawing out its goodness gradually and with relish, we have slammed it into one of those newfangled electric macerating machines and, in a twinkling, squeezed out of it not only the golden juice but the bitter pulp along with it.

No, the long, calm, tranquil life is not for Americans. Philosophy is not ours, nor retrospection, nor a sense of life's values—until too late. We have become a nation of headline readers. We spend most of our time rushing nowhere, seeking new and esoteric thrills, burning up our energies in the fierce fires of this new thing we call civilization.

But with the bad there is much of good. A number of years ago a genius-like zealot tried to convince the American public that it should take at least as much interest in its own bodies as an engineer takes in the locomotives he drives, and for the same reason—to keep them operating long and smoothly and properly. Almost overnight "physical culture" became a nation-wide fetish. It never quite died out. There were enough people who realized its wisdom and value to keep it going, at least in their individual cases. It ramified enormously. The late Walter Camp did much to encourage people to take care of themselves, physically. There were many others who did likewise; gymnasiums sprang into being all over the country; women began to take an active part in outdoor sports. The public interest in baseball, football, polo and other spectacular games grew gigantically from coast to coast. The increase in the number of clubs devoted to golf, tennis, fishing, hunting, canoeing, and other outdoor pastimes has kept full pace with our astounding commercial expansion.



Oval—A "hotel" for two. Below—Off for the week-end, with trailer.

Then came Florida!

The past winter in that semi-tropical promontory has witnessed a boom in comparison with which the Gold Rush of 1849 was a mere local disturbance. Thousands have flocked there to revel in the climate, the imported amusements and the nearness of pleasure-bent crowds, only to

Cabin of a motor boat.

A motor boat cruise.

Cruisers of the Detroit Yacht Club.

ıd other thousands already ensconced
the premises—selling real estate.
evelopments of acreage have been
arted on a dream and a ten-dollar
ll and have progressed now into the
illions.

In other words, America has gone
to recreation, vacations and outdoor
orts with the same furious enthusiasm
put into making money, building
ies, dancing, cross-word puzzles and
aking automobiles. And in following
newest and probably most con-
ructive hectivity it is using the
wer which nature put aside
r this or some other purpose
untless ages ago—the
wer of gasoline.

Modern vacations
ould be practically im-
ssible without the aid of
e gasoline engine. With
help America is getting
tdoors, away from the
n o k y, soul-deadening
barets, the fat-building
idge tables, the monotonous
irligig of business, social and
usehold routine and the same-
ss of scenery, thoughts and faces.

Yes, America is going in for gasoline
cations wholesale, on the land, on the
ter and in the air. Motor touring
m hotel to hotel and motor camping
ve been adopted by millions; motor
ating, undergoing a sudden and well-
served growth in popularity, numbers
devotees by the hundred thousands
ile aviation's disciples, speaking
reationally, are, for the nonce, only
the dozens but will increase presently.

Automobile camping has caught on
cause it is sensible, easy of accom-
shment and inexpensive. However,
is not fool-proof. It requires a
tain degree of intelligence, natural
aptability to varying conditions and
good deal of preparation on the part
those who would follow it success-
ly and with the greatest benefit to
alth and spiritual well-being. The
nerican Automobile Association has
imated that this year motor tourists
d campers will spend $2,500,000,000 in the communities near the great recreational centers and along the popular motoring highways, at least one billion of which will be spent in Florida and California. Of the vast number of gasoline nomads who will do all this spending, a certain large percentage will start off with a variegated and ill-chosen assortment of totally inadequate equipment and will return shortly sadder and wiser and possibly with some of the ills which follow a neophyte's attempt to "rough it" by sleeping on the damp ground without proper outdoor bed clothing, depending entirely on fried food for nourishment during the trip and doing any or all of the other ill-considered things which may be expected from a city person who has never had to rely on himself (or, more important, herself) and does not realize the necessary difference in living conditions between a steam-heated apartment with its elevator service and tiled bathrooms and the great outdoors.

Motor camping, properly done, bears but a slight relationship to "roughing it." If there are women in the party it behooves the originators of the particular tour to supply them with the most comfortable accommodations it is possible to secure. This may mean the purchase of a fully equipped camping trailer which comes in a dozen different makes from $180, up, and, on a few minutes' notice after reaching camp, provides two wide, comfortable spring beds, high up off the ground and fully protected from insects and tempestuous weather. A little curtain down the middle divides the trailer into two rooms and the modernity of the present type of motor camping equipment makes available surprisingly efficient gasoline-burning stoves for broiling, boiling, roasting, baking, and, yes, frying. Camp illumination is taken care of adequately by small but radiant gasoline lanterns, electric lamps and hand flashes and other types of lighting fixtures. Complete sets of nesting aluminum or retinned steel pots, pans, dishes, plates, cups and saucers, and other eating utensils take the place of the equipment of the home kitchen and are infinitely better for the purpose in every way.

A very large majority of the motor camping clan prefer to follow the pastime by piling tents, clothing, sleeping and eating equipment and other duffle into touring car or sedan. This is all right if done in a well-thought-out manner. The packing of the car must be such that the heaviest items are at the bottom and the things which are needed first on reaching a camp site are most readily accessible. The tents now available for motoring gypsies are immensely practical, bearing in mind, of course, that in tents as in everything else you get just about what you pay for. They can be set up in a very few minutes. They have floor-cloths, either sewed in or separate (the latter being preferable), bobbinet screens over doors and windows, storm flaps operated from inside and most of them are really waterproof—a most important feature.

The first rule for comfortable and healthful camp sleeping is to have as much bed clothing under you as you have over you. With that one requirement in mind, it is possible to obtain suitable sleeping equipment in great variety, including wool or eider-down sleeping bags which can be supplemented by any desired number of blankets, pneumatic mattresses surrounded by heavy storm-proof cover-

ings which protect not only the mattress but the sleeper as well, and folding cots which take up but little room in the car but which are as comfortable as your bed at home.

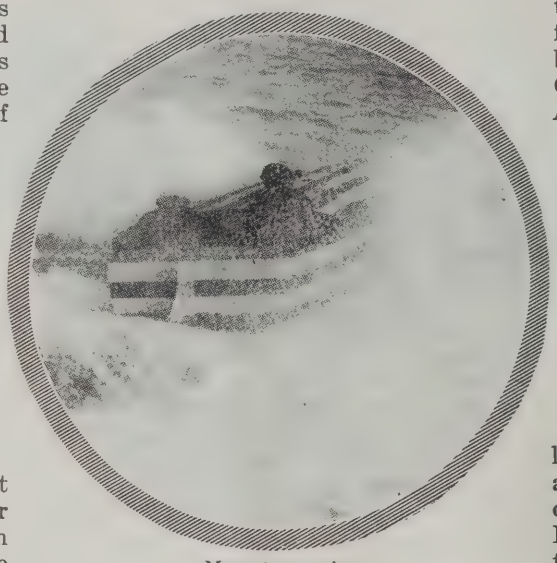
The whole subject of motor camping cannot be exhausted in one short article nor can it all be learned in one trip. The writer, from personal experience, and after consultations with some of the country's best known guides and motor campers, has prepared a long list of suggestions for motor camping equipment which he will be glad to send without cost to any reader who sends in a self-addressed, stamped envelope. And then later, after you have gone over the list, bearing in mind that most beginners carry entirely too much with them and that an allowance of 75 or 80 pounds is more than ample for each camper, he will be glad to tell you where any of the items you have in mind may be secured.

Motor camping is really a worth-while sport and a splendid method of enjoying a long or short vacation with a minimum of expense and a maximum of healthful exercise and broadening travel. But, as I have intimated, it is not a sport for him who cannot cook a simple meal upon occasion, and who cannot dress himself without a valet's tender care.

Motor boating is quite a different matter, different not only in its manner of execution but in its freedom from crowded highways, dust, motorcyle and traffic police and some of the other disadvantages from which motoring suffers, especially on Saturdays, Sundays and holidays, in the vicinity of big cities. The greatest fun, the greatest economy and the greatest benefit to health and mental well-being in motor boats are obtainable by cruising and this means that you take along with you on your travels a miniature reproduction of your own home.

Tremendous strides have been taken by the motor boat industry in the past few years in designing and building practical little family cruisers for from four people up, ranging in price upward from $1,495. By cruising I do not mean that it is necessary or even desirable for a family leading the motor boat life to attempt to cross any oceans or to establish any long-distance voyaging records. Around almost all of our large cities, New York, Chicago, Philadelphia, Boston, Detroit, San Francisco, and New Orleans, there are innumerable enchanting waterways, lovely sequestered spots of beach and fishing grounds, many of them within reach of the motor boat cruiser who has only week-ends and an occasional holiday to inspect their charms. In the bays, rivers, lakes and harbors adjacent to the towns mentioned and innumerable others, many hundreds of American families are at this moment living aboard their motor boat cruisers, leading a life that is full of reposeful recreation, and healthful activity and which is so free from the financial, social, and other cares of life ashore that the enjoyment of Nature's offerings and the splendid appetites and long, hard sleep the outdoor life brings are possible in boundless measure.

Living on the shores of Long Island Sound, I know any number of people, both moderately fixed and well-to-do, who rent their houses and apartments in May, take to their boats and live aboard them until late in November, in many cases paying the entire expenses of the summer from the profits on the rental of the home. These people



Motor boat racing

do not stay in one spot nor do they voyage afar. They stay for a week or longer in the tranquil harbor of New Rochelle, or at Larchmont, Greenwich, Stamford, Manhasset, Hempstead, Port Jefferson, and then go on to the next, the men of the family commuting to business in New York, the women enjoying the activities of whatever town is nearest or going farther afield in their automobiles. These families fish, and swim and sail in the moonlight and on bright days. They get much out of life that the indoor person would not understand and at the end of the season they are hard-muscled and tanned and in splendid shape for whatever the winter may bring.

Yes, living and sailing in a standardized, cleverly arranged and reliably powered family cruiser is the highest height of motor boating and an increasing number of people are beginning to realize it and go in for it. On the other hand, there are many other forms of motor boating which bring pleasure and thrill to the participant. There are thousands of ardent fishermen whose only opportunities for the following of their sport come on Sundays and holidays. To these fellows the outboard motor brings the gratification of their desires. An outboard motor, as you doubtless know, is a little one or two cylinder detachable engine which, in its handy carrying case, can be parked 'tween times in the hall closet, transported in the family car or by train to the selected watering place, attached in a jiffy to the stern of a rented rowboat and thus will supply, to all intents and purposes, a reliable, economical little motor boat which will make from 7 to 10 miles an hour, save hours of back-breaking rowing and allow the fisherman and his party just so much more time at their sport. These diminutive engines weigh from 35 pounds up, and are priced so that the most moderately financed person can own one without undue strain on the pocketbook.

Then there is motor boat racing, truly the peak of thrills without danger for the red-blooded person. In the big events, such as the contests for the Gold Cup of the American Power Boat Association or any of the other historic and hotly fought for trophies, participation is an expensive and specialized matter. On the other hand, for local club races and such, the owner of one of the many types of standardized runabouts can nearly always be sure of some thrilling racing without added cost or special preparation.

Motor houseboats have reached a point of great luxury and great seaworthiness. They are, more or less, a glorification of the cruiser idea and every autumn long streams of them can be seen on their way from the North to the Florida playgrounds through the wonderful inside route from New York to Key West. Day cruisers are another type of luxury ship in which wealthy men commute to business from their country homes at between 30 and 40 miles an hour. All of these motor boats, of whatever type, represent an ideal opportunity for the enjoyment of gasoline vacations.

Last summer some of the leading figures in the automobile world decided to go on a hunting expedition by flying boat from New York to Hudson Bay. At the last minute, after all preparations were made, the trip was called off for reasons not in any way connected with the project. The fact that these men, whose names are synonymous with efficiency and conservatism in the motor world, not only considered such a journey feasible but actually were about to undertake it, would indicate the practicality of such a venture.

Today's newspapers tell us of a regular, biweekly service just inaugurated on Long Island with a 14-passenger, double-engined transport plane which has begun to carry golfers from Mitchell Field, Long Island, to Yorktown, Virginia, for week-end tournaments at the Yorktown Country Club.

We are living furiously and, praise be, we have begun to play almost as furiously as we work. Where that play includes participation in gasoline vacations it cannot fail to have good results.

I Read *in the* Papers—

read in the papers of bored and ot altogether profound intellectuals iscussing whether life is worth while · not. There is a giggle in this for ie realist. Is life worth while? Ah, me! s the moon worth while? If not, why? nd what of it? Do you think to re- ove it in favor of a Mazda or Cooper- ewitt? Of course not. The moon, you find it not worth while, can never- eless not be got rid of. One can't re- ove it; one can only remove oneself. nd, of course, it is the same with life. ' one doesn't like it, one can tear up ie's program and leave it flat. But hat will that prove? Life is neither orth while nor not worth while. It is. nd if one finds it unsuitable and turns ie's back on it, it proves that life has ound one more of its experiments not orth completing. Every condemna- on of life is a confession, however teresting, of one's own unworth.

read in the papers that the brief That's that" has become a new vogue s a finality; but am once again forced conclude there is "nothing new under ie sun," for in the Bible I find Peter at entecost declaring "This is that," and n told that even then the Apostle uoted the Prophet Joel.

read in the papers notwithstand- g the efforts of bankers with their oldsmiths' and pawnbrokers' tradi- ons to restore the world to the gold asis, there neither is nor ever will be ough gold to enable the universal gold asis to be established.

At the end of 1923, there were nine nd one-half billion of gold in the easuries of the world. It would have equired at least ten and one-half bil- on of gold to have placed the United tates and Canada, Europe (excluding ussia and Turkey), South Africa and ustralasia on the gold basis. Mexico, entral and South America, Asia and ost of Africa would have been un- rovided for. Although the United tates had about four and one-half illion of this gold against its then cal- ulated need of two billion eight hun- red million, our rate of increase of opulation and industrial production ill require four and one-half billions gold in ten or twelve years if the gold asis is to be maintained.

read in the papers that as a result the profitable clip in the speculative arket which closed a short time ago, all Street brokers are enjoying longer acations this summer than ever before. ot only that, but partners are away at ie same time, leaving business to the fice help. Most of the beneficiaries of the kitty" are in Europe; some in alifornia. The thousands who got uck are at home with noses on the indstone, earning enough to try it gain.

The Rose in America

(*Concluded from page 8*)

queen of flowers. Portland is said to have no less than twenty-two thousand rose gardens.

The Pacific Coast is ideal for rose growing. In the southern part of California even the most tender varieties thrive unrestrained. The houses are covered with them. They clamber over trees and drape the bankings. One road leading out of Los Angeles is lined with roses on both sides for fully twenty miles. This plan of using roses along the highways is to be adopted in other states. Years ago one of the railroads in New England planted the the embankment along its right-of-way with climbing roses, which not only provide a feast of color in the spring, but also serve the utilitarian purpose of holding the soil together and preventing erosion.

Many New Roses Have Been Created

America has a long list of native wild roses, most of which are useful in landscape planting. Garden makers, however, demand a different class of roses, the double, free-flowering blooms, obtained through the art of hybridization.

In spite of the fact that seven or eight hundred species of roses have been created in this country, hardly more than a dozen men have won a niche in the horticultural hall of fame by their work along this line. Yet the men who have made it possible for America to have its own rose creations have been, and some of them still are, giants among horticultural experts.

Perhaps the name of the late Dr. Walter Van Fleet should head the list. In whatever garden one may go, he will meet Dr. Van Fleet's rose children. Some of them, like American Pillar, Silver Moon, and Bess Lovett are rapidly making their way round the world. One of his last productions, Mary Wallace, is one of the best climbing roses in existence, and is being distributed through the efforts of the American Rose Society, with the purpose of making it available in a few years at a low price to amateurs in every corner of the land.

Dr. Van Fleet, however, was by no means the first rose hybridizer to put out rare climbers. Among the first to appear were the Dawson rose and then the C. S. Sargent rose, created by the late Jackson Dawson, of the Arnold Arboretum, in Boston. The Dawson rose is too rampant as to growth and too thorny as to stem to make it a good garden plant, but the Sargent rose remains one of the best pink climbers.

About the same time that Mr. Dawson was doing his great work, a young Irish gardener, M. H. Walsh, was making some experiments at Woods Hole, not far away. A few years later he put out a series of climbing roses which have not yet been surpassed, and which created a genuine furor. Among them was the beautiful single Hiawatha, probably the most brilliant climbing rose in existence; Excelsa, a red rose which is rapidly displacing the old-time Crimson Rambler in gardens everywhere; Evangeline and Paradise.

Meantime, down in New Jersey, W. A. Manda was also seeking to develop American roses for American gardens, and presently gave the world such good kinds as Pink Roma, Gardenia, and Evergreen Gem.

Among the older Rosarians, one who still remains is John Cook, of Baltimore, now past ninety, but as interested as ever in American-made roses. Mr. Cook's fame would be established if he had given us only such roses as Radiance, which stands near the top, if not at the actual head, of all garden roses of American birth. In addition to Radiance, however, Mr. Cook has twenty-two productions to his credit, among them the beautiful double red rose, Frances Scott Key, and My Maryland. Living as he does in a historic section of the country, he seems to have a special liking for patriotic names.

Rose Culture Increasing in America

California is the mecca of rose growers who raise plants for outdoor gardens. In former years a large proportion of the rose plants sold in America were imported from Europe, especially from England and Holland. Now under the quarantine regulations of the Federal Horticultural Board, these plants can no longer be brought in. Accordingly, American growers find imposed upon them the task of producing the plants which are to beautify American gardens.

A fear was felt at one time that the drastic rulings of the Horticultural Board would make a great scarcity of roses in this country, as it has of rhododendrons and azaleas. Apparently, however, there is no reason for alarm. American rose growers have risen to the occasion, and are producing all the plants needed to keep American gardens abloom, the only drawback being a slight increase in price.

Ever since the war there has been a tremendous increase of interest in the growing of all flowers, and especially in the cultivation of roses. This is a fact which may well rejoice the hearts of all good citizens. Men and women who spend their spare hours cultivating flowers have very little time for indulging in Bolsheviki propaganda.

Did Man Know the Dinosaur?

If He Did Not, How Did He Make Pictures of Them on the Age-Old Rocks of Arizona?

By HARRY H. DUNN

A SMALL party of American explorers, penetrating a lonely gorge in Southwestern Arizona, has brought back a discovery which has set students of paleontology and anthropology wondering whether all ideas of the antiquity of man on the Earth are not wrong, and whether the theory of the evolution of man and the apes from a common ancestor is not in need of serious and immediate revision.

Cut with rude stone chisels into the wall of a cliff in Hava Supai Cañon, these explorers found what its maker evidently intended to be a picture of a dinosaur. Less than one hundred miles away, in the heart of the Painted Desert, these same explorers discovered the petrified footprints of a number of dinosaurs. Never before has there been the slightest inkling that man was contemporary with these huge lizards. Never before has it been even remotely considered by scientists that man's appearance upon earth antedated that of the manlike apes. Yet, if a manlike animal carved a picture of the dinosaur on the wall of his cave, either he or some of his ancestors must have seen that creature. If this manlike animal saw the dinosaur, he must have lived contemporaneously with that huge lizard.

If man was coeval with the dinosaur, then man must have appeared upon this earth in the Jurassic period of the Mesozoic Age, millions upon millions of years before he is supposed to have appeared—at the ending of the Tertiary, or the beginning of the Quaternary (present) Age. For the remains of the dinosaurs appear in that Jurassic period, in the remote time when reptiles ruled this globe. Far antedating the remains of man, the fossilized bones of apes have been found back in the late Eocene and early Oligocene periods of the Tertiary Age. None have been found in the Mesozoic Age, when the dinosaurs flourished. It is a part of the theory of Evolution that back of both man and the apes stood a common ancestor, but if an animal, capable of drawing on the walls of his cave a picture of another animal, lived before the earliest known ape—what becomes of the theory of the common ancestor? Is man the oldest of all mammals? Is the ape merely a degenerated branch of the man-family? Or is there no connection whatever between man and the apes? Are we coming to an irrefutable proof of Genesis: "So God created man in His own image, in the image of God created He him."

Nor are these indications of the contemporaneous existence of man and the dinosaur the only results of the trip of these scientists into what might be called truthfully "unknown America." They brought back casts of the footprint of the largest of all known mammals, either living or extinct, the Imperial Elephant. A restored skeleton of this animal, found in the famous brea pits near Los Angeles, and now in the museum of that city, is approximately fourteen feet high at the shoulder, as compared with the nine to ten feet height of the largest of present-day African elephants. They found a rock-carving, in a good state of preservation, of a fight between a man and an elephant, indicating that man was contemporaneous with this huge mammal in the New World.

Possibly next in importance to the finding of the dinosaur picture and tracks, was the discovery of a wall-carving showing men hunting the ibex, an animal not before known to have existed in the Americas, though its fossil remains have been found frequently in Europe, and drawings of the animal are extant today in the prehistoric caves of France. The explorers also found, imprinted forever in the rock, the tracks of animals which have not yet been identified, with the possibility that they may have been those of prehistoric man.

The full results of the expedition, and the worth of its discoveries, will not be known until the scientists of the United States National Museum, one of whom accompanied the party, have completed their studies, but there are strong indications that the explorers have found a region in which several "strata" of humanity were superimposed, one upon the other, perhaps from the day of the dinosaur down to the present, and rapidly disappearing handful of Hava Supai Indians.

The expedition, which was under the personal direction of Samuel Hubbard, curator of archeology of the Oakland, California, Museum, was financed by E. L. Doheny, who, on a prospecting trip into the Hava Supai country in 1879, had heard from the Indians of the "picture caves" on the Hava Supai River. Accompanying Mr. Hubbard as scientist of the expedition was Charles W. Gilmore, curator of vertebrate paleontology of the United States National Museum; Robert L. Carson, photographer; Joseph F. Roop, sculptor and maker of casts; F. V. Shaw and Arthur Metszer, assistants, and Bud Clawson, guide and packer. With the Indians also employed, the party numbered thirteen, with more than a score of horses and mules.

They left Los Angeles late in 1924, and returned early in 1925, going direct to the Hava Supai Indian reservation and agency, some 55 miles southwest from the Bright Angel Trail on the Colorado River. The Hava Supai Cañon is formed by Cataract Creek, which rises in Mount Bill Williams and joins the Colorado River about 150 miles west of the Bright Angel Trail.

The Doheny expedition in the Hava Supai Canon, showing the stratification of the ancient red sandstone, probably laid down in the Devonian period of the Paleozoic Age.

fter wandering for some fifty miles ver high plains, Cataract Creek sudenly forms a box cañon, and, arting on the top of the old red ndstone, has eaten—and is still ting—its way deeper and deeper into is formation, so that red cliffs rise er higher and higher on both sides. o understand the location of these scoveries, the reader is referred to the companying sketch map of the route the expedition. At the point where e walls begin to widen to form the ox," there is contact between the d sandstone and the Silurian lime. om a crevice in this contact flows a bterranean river which never varies quantity, summer or winter. This eam, flowing through the cañon, ms three high and beautiful falls, its way to join the Colorado. The ter is slightly warmer at the point emergence than other spring waters the neighborhood, and is so charged th lime that everything which comes contact with it is changed rapidly o limestone.

This stream today is the only tor which permits the remnant of e Hava Supai tribe to live here, for th it they irrigate about 500 acres which they produce their living. ite evidently this or a similar rce of water supply was an equally portant factor in the lives of the ehistoric men who inhabited this tion, and whose drawings, of varying es and on myriad subjects, literally er the walls of the cañon. The elevation of the valley is 3,195 feet above level, while the higher surrounding ins, largely solid stone, into which stream has carved its way, are m 6,200 to 6,700 feet altitude. In s valley the government maintains agency for the care of the 186 reining members of the once strong and warlike Hava Supais. This agency and the Indian village near it form a veritable oasis in a desert of rock. The region is ideally situated for the preservation of whatever monuments, pictures or other records prehistoric dwellers may have made there, but the Hava Supais consistently and persistently refuse to reveal the whereabouts of any pictographs or other memorials of the departed peoples of the region. Such relics must be hunted out by white men, whom the Indians, though friendly, seek to discourage from investigations of this character.

Pictograph of elephant attacking man. This indicates that man was coeval with the elephant in America.

From here, let Mr. Hubbard tell as much as he will reveal of the discoveries made by the party.

"It was at Lee Cañon, a tributary to the Hava Supai Cañon, after we had established our headquarters in the fertile little valley which feeds and shelters the dwindling Indian tribe, that we found the most important remains of prehistoric man's occupancy of this area. These are in the form of wall pictures, carved into the solid stone, and apparently done by succeeding waves of mankind, some of the work showing every appearance of great antiquity, and other pieces being quite as evidently due to much later—though prehistoric—artists. The carvings are on a large wall of the lower red sandstone of the Devonian period of the Paleozoic Age. This, of course, does not mean that the pictures were made in that period or that age; I am merely identifying the material in which the men worked who, I believe, knew and saw the dinosaur. This wall is at the junction of Lee and Hava Supai cañons and the pictographs are up about 20 feet from a bench on which a group of mesquites are growing.

(C) Samuel Hubbard.
Pictograph showing Indian hunters driving ibex and deer into trap or mountain pass.

"Narrow ledges, probably wider in the days of the ancient artists, give access to the pictographs, but these stone shelves were not wide enough for photographic work, and we had to drag in a number of long and heavy timbers and build a scaffold for the photographer. Most of the pictures are now out on an open wall, without any shelter, overhanging rock or cavern to protect them from the elements, though there are indications that at one time there was an overhanging ledge of the same red sandstone. All are made in the same way, and this is interesting because the method of work differs from that by which most of the pictographs in the world were made. The red sandstone contains a trace of iron. This iron, through the chemistry of the ages and the elements, has formed a thin black coating over the rock. This coating is known locally as 'desert varnish.' By taking a sharp instrument, such as a piece of flint, and cutting through this black scale, the red stone is revealed underneath, thus making a red picture, with black surroundings, which is at once imperishable, and yet needs no painting to make it stand out in relief.

"The only way one of these pictographs can disappear is to 'weather off.' How many millions of years are required to create the thin shell of iron oxide over the red sandstone, no one knows, but not one of the pictographs shows any sign of such recovering. In the 45 years since 1879 in which Mr. Doheny has known of these pictographs, he tells me there has been no dimming of their brightness. The figures consist of men, a small animal resembling a dog, but probably referring to either a wolf or a mountain lion; the elephant and the man engaged in combat; a number of ibex, with and without men hunting them; several deer, some mountain sheep; and, most (Continued on page 28)

Pictograph of the dinosaur found on very ancient red sandstone cliff in the canon of the Hava Supai, Arizona.

Good Players Often Poor Managers

Why More Baseball Stars Do Not Become Successful Directors of the Game

By PAUL MACDONALD

IT is the ambition of every ball player, at some time or other, to manage a major league team. Each visions himself sitting on the bench, managing a team, after his playing days are ended.

There are sixteen teams in the two major leagues and the average change in managers is less than two each season in each of the major circuits. Since there are 400 ball players in the big leagues each year the chance of each individual graduating into the managerial ranks at some later date is slim indeed.

With all this material to choose from, good managers are scarce. Only a few of the men now at the head of major league teams can be regarded as star managers.

The public probably wonders why there are not more good managers. With the number of crack players to select from, the club owners should surely be able to pick a better class of leaders than head the big league teams at the present time. But that is where the public errs. Few good ball players have become good managers; no great ball player has ever become a great manager.

The very thing that the public believes qualifies a great ball player for the job of managing is his biggest handicap. Great ball players, when they become managers, look down from the heights and those that look down from the heights do not see accurately.

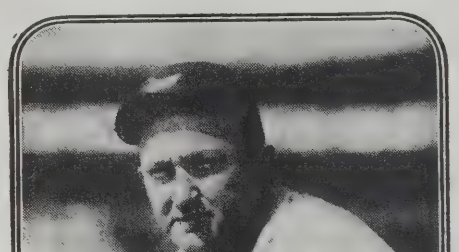
On one occasion I was discussing this subject with Tris Speaker, the best outfielder the American League has produced and the manager of the Cleveland Americans. I asked Speaker why more great ball players do not become successful managers. His answer is simple:

"The trouble with great ball players as managers is, of course, that they become impatient with the mistakes of their players. They tell them to do certain things and then, when they fail to execute the orders, they lose their tempers.

"The manager who was, or is, a great player never realizes, for some reason or other, to what he owes his position in baseball. If he stopped and figured that out for himself he would be a better manager. The reason he succeeded and became a leader was because he did things that other ball players cannot do. If they could do the things that he did then he would not stand out; he would only be an average ball player. The fact that he is not an average ball player, or was not an average ball player, should convince him why his players often fail to do the things he tells them in the way he tells them to do them."

No great ball player has ever become a great manager. That is a matter of baseball history. Some of them have become good managers. Most of them have been failures. The great managers have developed from good ball players and several of them had no practical playing experience of which to speak.

The greatest two managers of what is popularly known as the old school were Ned Hanlon of the Baltimore Orioles and Frank Selee of the old



TY COBB.

Boston team and later of Chicago. After Hanlon made the Boston Orioles supreme he shifted his activities to Brooklyn and repeated. Selee lifted Boston to the baseball heights and then traveled west. While he did not take Chicago to a pennant he built up a machine that was headed by Frank LeRoy Chance after Selee was forced out by ill health. Chance won pennants and world championships with the Selee organization.

Where, in the baseball record books, will you find the playing records of Hanlon and Selee? Still, each must be rated as a great manager.

Knowing what to do and getting others to do it are far different matters. No matter how much baseball knowledge is crammed into a single head, it will not make a team win unless the man who has the knowledge knows how to apply it. The man who has less knowledge and can get a team to use it is successful where the man with vast knowledge that cannot be applied is a distinct failure in baseball.

There are a large number of men, in all probability, who know more baseball than either Hanlon or Selee but they cannot approach either as managers. The thing that Hanlon an Selee knew was management of player They knew, above all, which perso to let alone. When Hanlon manage the Orioles he did not try to tell me like McGraw, Keeler, Jennings, Kell and Robinson what to do. He realize they knew more about their positio play than he did and he simply e couraged them to develop it. H created in them self-confidence, se reliance, aggressiveness, initiative.

Selee managed Boston in much t same manner. He was quiet, since and diplomatic. He knew how far go with each man. He knew where use the bridle and halter and whe to omit it.

Since their time the best manag has been John J. McGraw, manager f the New York Giants. Judged on l record McGraw must be put at t head of the list of managers as the be of all time. There is no question abo McGraw being a great leader. He is f Napoleonic cast. He rules with a iron hand. He drives his men.

McGraw's teams are distincti They play what the profession ca "heads-up" baseball, meaning i telligent baseball. They are f fielders and fast base runners. Th have snap and dash. They are i telligent batsmen, also. They ha drive, power plus speed, aggressiven and spirit.

There is about McGraw a magn personality. He was the first mana who used the "will to win" theory a the "a team that won't be bea can't be beaten" principle.

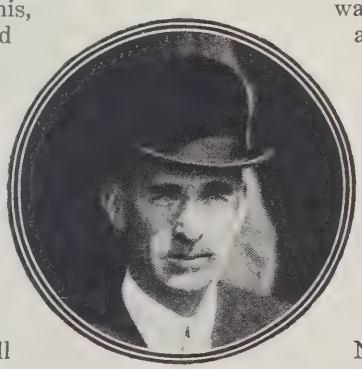
The season of 1924 furnished n excellent example of the McG system. The pennant race was fa tight and the Giants were leading b slight margin. Disaster suddenly e fell McGraw's team late in Septem Groh and Frisch, the mainstays of he New York infield, were injured a forced out of the lineup. One of hi regular outfielders was laid up. Ta would have wrecked fifteen out of sixteen teams but it did not wre McGraw's. He turned a liability to an asset. He impressed his pla that they were good enough to wi without the support of these stars an he so filled his team with the "w be beaten—can't be beaten" princ that the Giants really played be ball after the lineup became wrec They played above their speed, is true, but all the more credit to McGra because of that.

McGraw came up from the ra He was a good ball player but n a great one. He was always an intelli player but he failed mechanically. He was a poor fielder, judged accor to major league standards. He was

aggressive and smart, particularly at bat and on the bases, but his fielding was too weak and his batting never strong enough to elevate him among the great. Still, as a manager, he stands without equal, at least according to the records.

Cornelius McGillicuddy, whose name has been Connie Mack ever since he started playing ball, has the best record of any manager in the American League, although in the last ten years his teams have been last or next to last each year. Mack is of a type directly opposite to McGraw. He is the soft-spoken, cajoling kind of manager. His teams have always lacked fire and aggressiveness, snap and dash. Even the great teams that Mack managed when he swept the baseball universe lacked these qualities. They lacked color, particularly the color that McGraw's teams always carry. Mack always aimed for mechanical perfection. His teams played baseball much as Willie Hoppe shoots billiards, with the same mechanical precision and monotonous perfection, rather near-perfection. Things always moved according to schedule with them. They followed the system accurately. You always knew exactly what would happen under any condition and in every situation. The play was always made the same way with mechanical skill and smoothness.

Had Mack not broken up his team at the close of the 1914 season his record would rival that of McGraw. His infield, the best in baseball at that time and one of the greatest of the baseball ages, would have lasted for years. Frank Baker, who played third for him, retired only a few seasons ago. Jack Barry would have remained in baseball if the combination had continued. Eddie Collins is managing and playing second base for Chicago almost as well as he ever played the position. Jack McInnis, first baseman, was dropped from the majors only this spring. But Mack broke up his team because they failed to draw in Philadelphia. They won so regularly that it became monotonous and Philadelphians tired of seeing them win.



CONNIE MACK.

If you leave it to American League ball players to name the greatest manager that circuit ever knew they will elect Bill Carrigan to the position of honor. Carrigan managed the Boston Red Sox and drove them into two pennants and world championships. He was a great manager who could still be leading ball teams had he not decided to quit baseball while his record was good.

Although Carrigan was a driving manager his players always swore by him and still do. Carrigan, like McGraw, was never beaten and he developed this spirit in his teams. He had the faculty of getting the last ounce out of his players and having them play above their speed.

Carrigan knew that all players cannot be treated alike. Most managers do not realize this. Carrigan had separate treatment for every man on his squad. What one man takes to another rejects. Carrigan always kept that in mind and acted accordingly.

There was Duffy Lewis, his left fielder. Lewis had the weakness of getting satisfied with himself at times and letting down. If he had a good batting and fielding streak for a series or two, he would start taking things easy. As soon as Carrigan was convinced that Lewis had let down he would bench him. Lewis then stayed on the bench, Carrigan ignoring him. In a week or ten days Lewis would get uneasy about the matter, believing that probably Carrigan intended trading or selling him. As soon as Carrigan decided that Lewis was anxious about his future he would send him back into the lineup and Lewis would "burn up the league" to prove to Carrigan that he was too good to be dropped.

JOHN J. M'GRAW.

Personal feelings never entered into his reckoning. He was as severe with himself as with others. In one game, with the score tied in the ninth, Boston got a man to second with two out. Carrigan, who was catching that day, was at bat. Suddenly Carrigan walked away from the plate and sent in Everett Scott as pinch batter for himself. Scott at that time was batting less than .200. Scott walked to the plate and hit a three-bagger on the second ball pitched, winning the game.

These two men, Mack and Carrigan, were both catchers. Neither was a great catcher. Mack could not even be classed as a good one while Carrigan was just fairly good. But as managers they have never been equaled in their own league.

If any man on the horizon at present is to take the wreath from Mack and Carrigan that man is Stanley Harris of the Washington team. Harris became famous last year, his first season as a manager, when he took Washington into a pennant and world championship, a rare feat indeed and particularly so since it was the first time Washington ever won a pennant.

Harris, like McGraw, started on the infield. While McGraw played third Harris' position is second base. He is still playing there. Like McGraw, Harris was never a great infielder. He was a good one. But Eddie Collins, in his own league, was always better and Marty McManus, of St. Louis, and Aaron Ward, of New York, were as good as Harris in several seasons.

If Harris does not develop into a great manager it will be surprising. He has all the needed qualities. He knows men and he knows how to get the extra ounces out of them. He knows how to lift them to top speed. Late last season, when Washington was struggling to hold its scant lead, Harris brought his team to Detroit for what was described in the newspapers as a "crucial" series. Rip Collins pitched for Detroit and he shut out Washington with a brilliant exhibition of pitching. It was a close game and Washington might have won or at least sent the game into extra innings, but for a few bad fielding plays that gave Detroit her runs. The average manager would have administered severe calldowns to the players making the blunders but not Harris. As he entered the clubhouse after the game he said:

"Well, fellows, we saw some great pitching today. It is as good as any we've seen all season. Collins was right this afternoon. But, we'll beat them the remaining games. We aren't going to see any more pitching like that this year."

Harris knew that the players who erred felt as badly about it as he could possibly feel, if not worse. He realized that criticism would probably break them. By saying what he did he caused them to try all the harder the next day. They appreciated his attitude, so did their team-mates.

On May 10, last season, Washington dropped to sixth place. On May 24 the team was still in sixth place. Instead of being discouraged during those two weeks Harris seemed highly optimistic. Whatever he thought about the matter he never told. He impressed his players that they were in a temporary slump; that it was best to have the slump just then; that as soon as they left the slump they would set the league burning with their speed. He talked so much about their chances that he got them to hustle harder and harder. They got out of their slump. On June 28 they were in first place and they were there at (Concluded on page 22)

"The Mad Booths" and Lincoln's Fate

Psychotic Background Against Which the Actor Family Played Its Part

By F. L. BLACK

THERE lived in "the fabulous forties" about twenty miles from Baltimore at the family home, Belair, a "good-hearted, harmless, though wild-brained boy; a rattlepated fellow, filled with quixotic notions" who "would charge on horseback through the woods on the Maryland farm, spouting heroic speeches, with a lance in his hand, a relic of the Mexican War."[1] To his father, who died when he was thirteen, he was "the well beloved, bright boy Absalom."[2] He was his mother's darling,[3] and his love for her is attested by his devotion to her during the years that followed, although it cannot be said that he was obedient or that she had much influence over him. To this boy, John Wilkes Booth, the father had bequeathed a psychotic personality more dominated by phantasy than by that conscious voluntary effort which our modern psychologists call the reality motive.

On the paternal side John Wilkes Booth was related to that profligate demagog of the reign of George III, John Wilkes, for whom he was named, and who, "while seven administrations were raised to power and hurled from it in consequence of court intrigue or of changes in the sentiments of the higher classes of society, retained his hold on the affections of a rabble whom he pillaged and ridiculed."[4] Junius Brutus Booth, the father, a brilliant figure in the annals of the American stage, was afflicted with such great eccentricities of character that his actions in many instances can be classed only as paranoiac. Born in London in 1796 partly of Jewish descent[5] he early decided against the law, his father's profession, tried painting, printing, poetry, sculpture and the navy, then the stage and in 1813 became a member of a strolling company of players with which he toured the continent.[6] It was during this time that "by a boyish misalliance, contracted in Brussels in the year 1814, there was one son."[7] Returning to London in 1817, he successfully played in Shakespearean rôles. Edmund Kean was the great tragic actor of the period in England and "as 'two stars keep not their motion in one sphere,' and London could not brook the double reign of Edmund Kean and Junius Brutus Booth, the latter, after a short but brilliant contest, left the field,"[8] and first visiting France and the Island of Madeira came to America in 1821 with his young wife, Mary Anne Holmes, whom he had married on January 18, 1821.[9] There has been some question as to whether he legally married Mary Anne Holmes. Hornblow says that he was divorced from the Brussels wife. Asia Booth Clarke, in "Passages, Incidents, and Anecdotes in the Life of Junius Brutus Booth (the Elder)," pp. 64-65, states that on January 18, 1821, her father married Mary Anne Holmes, at the residence of the Honorable Mrs. Chambers, and that this lady, who had always manifested a great interest in her father's career, presented his wife on her wedding day with those well-known jewels which decorated the crown worn in his characterization of Richard III. Arthur Hornblow, in "A History of the Theater in America," Vol. I, p. 322, claims that Mary Anne Holmes was "an actress and one of the most beautiful women of her day." George Alfred Townsend, in the New York *Herald*, May, 1865,[10] states that "he (Junius Brutus Booth) threw off the wife of his bosom to fly from England with a flower girl, and, settling in Baltimore, dwelt with his younger companion, and brought up many children, while his first companion went down to a drunken and broken hearted death." (George Alfred Townsend repeats this story in his play, "Katy of Catoctin.")

The Booth home near Belair, as it looked in 1865.

This erratic stage genius soon became a commanding figure in American theatricals notwithstanding the fact that he was mentally unbalanced, which was evidenced by his maniacal excitement under stress conditions and his many deviations from the normal course. It was said of him by his daughter with regard to his mental impairment that his "aberrations o mind" could be traced back to hi youth but that they "seemed to in crease in strength and frequency wit maturer years."[11] The children wer taught by their mother to regard "thes periodical tortures of mind with sa and reverent forbearance."[11] J. E Murdock, an actor who played wit the elder Booth, describes him as sub ject to a morbid tendency of feelin which gave rise to wild and defian moods, and led him, at times, to thing at variance with the conventionalitie of society.[12] But that when th "cloud" passed and his true natur asserted itself, he was capable of win ning the love of many and the esteer of all. Many of those who played wit him were both fascinated and frightene by the fury, the intensity and the vividness wit which he depicted th intricate characters whos rôles he portrayed. I his "paroxysms of deli ious art" a stage fight b came real and the oppo ent often was compelle to struggle for his lif Murdock,[13] describir his actions in a scene the had together, says, ' turned, and there, wi the pistol held to my hea stood Booth, glaring li an infuriated demo Then for the first time comprehended the reali of acting. The fury that passion-flamed fa and the magnetism of t rigid clutch upon r arm paralyzed my m cles, while t scintillating gleam of the terrible ey like the green and red flashes of enraged serpent, fascinated and fix me spellbound to the spot."

At another time, in a rehearsal Othello in his hotel room, Junius Br tus Booth became so vehement that

roommate in self-defense struck him across the face with a fire poker, breaking his nose and marring his countenance.[14]

The elder Booth was a strict vegetarian, believing that it was wrong to kill animals for food. This belief was expressed in his disordered mental content in an odd fashion while playing in a mid-western city in January, 1834. He wrote to a local minister for information as to a burial place for a dead friend. Imagine the good dominie's surprise when, calling at Booth's hotel room, he was conducted by the great tragedian to an adjoining room to view the remains and was shown "about a bushel of wild pigeons" spread out on a large sheet. "Booth," said the pastor, "knelt down by the side of the birds, and with every evidence of sincere affliction began to mourn over them. He took them up in his hands tenderly and pressed them to his heart." Booth purchased a lot in a cemetery, had a coffin made, procured a hearse and buried the pigeons with himself as chief mourner.[15]

A week after the pigeon incident, Booth becoming more deranged, failed to appear at the theater one evening and could not be found. The next morning he was located, wandering through the snow in the woods some distance from the city.[16]

Three years later in New York City he was to be in a benefit performance but did not appear and was found this time at a fire helping to run the fire engine.

His great suggestibility is shown by an incident which happened on one of his theatrical tours. When the boat on which he was passenger neared a point where William Conway, an actor, had committed suicide by jumping into the ocean, Booth, saying he had a message for the unfortunate Conway, leaped from the boat. He was rescued from drowning with difficulty. After he was pulled into the rescuing boat, it is reported that his first words were, "'I say, Tom, look out, you're a heavy man, be steady—if the boat upsets we'll all be drowned.'"[17] Finally, growing tired of all social contact, he expressed a desire to retire from the stage and become a lighthouse keeper, where he felt he would have peace and quiet, but this ambition he never carried to execution.[18]

Edwin Booth in 1889.

With all his mental aberrations the "American Garrick," as the Elder Booth was called, had the most essential requisite for a tremendously successful stage career—He could carry an audience with him. They forgot him, the stage, all except the character he portrayed. So vivid was his recitation of the "Ancient Mariner" that his "magic tones and glittering eye" transported his listeners to the terrible scene where "they saw the shining sea, and the slimy things which crawled upon its surface; they felt their tongues withered and their throats parched with a burning drought; they heard the four times fifty men as, one by one, each fell a lifeless lump upon the rotting deck; and they read the horrible curse in the dead men's stony eyes."

Junius Brutus Booth, the father of Edwin and John Wilkes.

To the second matrimonial venture of this mad genius, who died November 30, 1852, on a Mississippi River steamboat while returning home from an engagement in New Orleans, were born ten children, five of whom were living at the opening of the Civil War. Junius Brutus, Jr.,[19] who became an actor but never attained fame; Rosalie, Edwin, possibly one of the greatest tragedians the American stage has produced and whom the father had wanted to become a cabinet-maker;[20] Asia, who in 1859 became the wife of the comedian, John Sleeper Clarke; Joseph,[21] the youngest son, who tried the stage but failed; and the "ill-starred" John Wilkes, born in 1838, who inherited his father's fiery temperament, his great suggestibility, his psychopathic personality, and much of his ability but not his enterprise. The foundation of his inability for social adjustment was hereditarily imbedded to such an extent in his personality that he was predisposed to mental derangement when the stress should become sufficient.

One of our great alienists, who had seen him on the stage, says of him:[22] "As a boy Wilkes Booth showed many evidences of instability, and was subject to moods and fits of melancholy, as well as morbid suspicions and moroseness. He was wayward, something of a vagabond, and at one time ran away from home and joined the pirate oystermen in the Chesapeake Bay. At other times he was winning, gentle, and entirely lovable."

According to another biographer,[23] John Wilkes was sent to a better school than the other brothers had enjoyed, but, detesting the confined life of the schoolroom and loving the open air, spent his time fishing and hunting, where he gained the admiration of his asssociates by his "fine nerve and certain eye." He learned to ride while quite young and became an accomplished and graceful horseman. He was proud of his skillful fencing and was quite dexterous in the handling of small arms.

To what extent association with the father intensified and extended the congenitally paranoic tendency of the son cannot precisely be determined; our knowledge of their relations is indefinite. But it can hardly be doubted that, in the formation of John Wilkes' character, the elder Booth was a condition as well as a cause. Whether the son displayed psychotic tendencies in childhood is not a matter of authentic record. After his death numerous extravagantly written newspaper stories gave some sordid details of his life that may or may not be true.

During the last ten years of his life, 1842-1852, the father remained much at home.[24] This was during the most impressionable period of the son's life, and the years of fullest development of the elder Booth's emotional impairment, so that the father whom John Wilkes knew best was "a madman, the wreck of a splendid genius." It was quite natural that the stage should attract him while still young, as it had his older brothers, but his first efforts were dismal failures due principally to his aversion to making the necessary exertion to learn his lines. Finally after playing in "utility" parts in Philadelphia, as John Wilkes, and being hissed off the stage, he decided to try his luck farther South. Undoubtedly the shattering of his "gossamer hopes and high conceits" in the North and his later achievements in the South had greater influence in molding his passionate sympathies for the southern cause than had the arguments he advanced to justify his ardor for its success. At the age of 23 he secured an

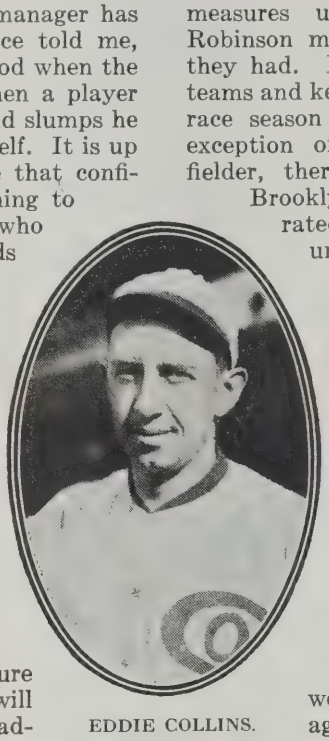
Good Players Often Poor Managers

(*Concluded from page 19*)

the close of the season. Other slumps came after June 28. A few times Washington was as low as third. But each time Harris told his players that they got out of their May slump and they would get out of the present one just as sure. They always did. He made them believe in themselves.

"The hardest thing a manager has to do," a star pitcher once told me, "is to tell a player he is good when the player is in a slump. When a player loses his grip on himself and slumps he has lost confidence in himself. It is up to the manager to restore that confidence. It is a difficult thing to keep on telling a player, who fails at bat and who fields poorly, that he is a great man but suffering because of bad breaks in luck. Praise at that time is hard to give; criticism is so much easier and managers, like the rest of us, are prone to follow the course of least resistance."



EDDIE COLLINS.

It is too early to judge what the status of Harris will be but from close observation of Harris and his methods in his first year as manager we venture the prediction that he will become one of the great leaders of baseball. He impresses us more than any man in his league.

Eddie Collins, greatest of second basemen, is starting on a managerial career. As head of the Chicago White Sox he has a chance to establish himself. The White Sox finished last in 1924, the first time in baseball history that a Chicago team ever ended the season in eighth place. So Collins has nothing to lose and much to gain.

Collins is one of the outstanding intellects of baseball and a splendid character. Like Harris he has a fine personality. Five months from now we will know a little more about his managerial ability but at this angle it seems safe to say that Collins will not be a failure. He is going to get much work out of his players and he will have them playing smart baseball. They have shown ability to do this in the early weeks of the season. The best manager in the National League, next to McGraw, is Wilbert Robinson, the chubby leader of the Brooklyn team. When the Orioles were in their glory Robinson was Baltimore's star catcher while McGraw played third. Later on Robinson was assistant to McGraw in New York. Then came the opportunity to manage Brooklyn and Robinson took the job.

Robinson is the exact opposite of McGraw. While McGraw is the driving type Robinson is the cajoling type. His strength is McGraw's weakness—pitchers. Robinson is the most successful manager in the majors in handling pitchers. He has succeeded in making stars out of a number that were cast adrift as worthless by other managers.

Outside the pitching the Brooklyn team has never carried material that measures up to the average but Robinson managed to get everything they had. He has taken these misfit teams and kept them up in the pennant race season after season. With the exception of Zack Wheat, the outfielder, there is not a man in the Brooklyn lineup who can be rated as a real star, but still, under the skillful guidance of the portly Robinson, Brooklyn has been a contender each season.

As they stand today McGraw and Robinson are the best among the National League managers and Harris is the choice of the American Leaguers. None of them was a great player at any time in his career but all three were good players and, above all things, smart players.

The American League's western division is now managed entirely by men that were great players. George Sisler, undoubtedly the greatest of first basemen, is at the head of the St. Louis Browns; Tris Speaker, the best outfielder the league ever developed, is boss of the Cleveland Indians; Eddie Collins, king of second basemen, heads the Chicago White Sox, and Ty Cobb, greatest player of all time, leads Detroit. We do not believe that Sisler, Cobb or Speaker will ever become a great manager. If one of the four is to achieve greatness then that one will be Collins. The future alone can decide his case. The other three have had opportunity to take their places but while they proved good managers they have lacked the luster as leaders that marked them as players.

BILL CARRIGAN.

The man who succeeds as manager is not the man who knows most baseball but the man who can get the most baseball out of his players, the man who can get each player to give the best he has on the playing field. It is not what you know bu what you can make others do tha counts. Some managers have faile with exceedingly strong ball clubs while others have succeeded wit mediocre teams. It is to a large ex tent a matter of personality.

Basketball has caught the popula taste. This year will see all attendanc records broken for college basketbal It may be that the growing interest i football has brought basketball int the same channel of popular favo for the modern games of football an basketball have much in common. A any rate the public is anxious to se college basketball and many of th universities find it impossible t to accommodate the crowds.

Next to the national and easter collegiate track and field meet tha of the Western Conference is mo important. The 1923 championshi were decided in Ann Arbor, Michiga Forecasts on the result of this me gave Michigan a fairly good chance winning but promised an extremel close contest. This, if nothing els would be an incentive for an outpourin of local enthusiasts. But the meet, he under perfect weather conditions b sides, attracted less than 4,000 pe sons. The counter attraction on th day when the finals were run was circus and this played to capacity matinee and night performances.

Last autumn, on the same fie where less than 4,000 saw the annu track and field championships decid in June, more than 40,000 persons we present on three different Saturdays see a football game and in Janua more than 8,000 were inside the gy nasium when a practice basketb game was played.

Track meets are tedious. Waits b tween events are lon This is one of t reasons for lack interest and it pointed out becau it is a fault that c be remedied.

William We Ellis is credited England with bei the father of Rug football because was the first m who ran with t ball in a Rugby gam Since American c lege football was d rived from the Rug game, William We Ellis' feat is of co siderable importan to the leading colle pastime in this cou try since it is the running feature f football that makes it popular.

Recent revelations show players r with the ball long before November, 18

"The Mad Booths" and Lincoln's Fate

(*Concluded from page 21*)

engagement at Richmond where, having parts more to his taste and playing them better, he won a fair amount of applause during two seasons. It is interesting that Junius Brutus Booth, the father, made his first American appearance in Richmond in 1821.[25] It was soon after this that Allan McLane Hamilton[26] saw him and described him as a handsome, dashing man with a magnificent head and features of the classic mold, a great deal of a Lothario, pursued by women wherever he went. Ben Perley Poore, a Washington newspaperman of the period, says that John Wilkes Booth had, "added to his native genius, the advantage of a voice musically full and rich; a face almost classic in outline; features highly intellectual; a piercing, black eye, capable of expressing the fiercest and the tenderest passion and emotion, and a commanding figure and impressive stage address.

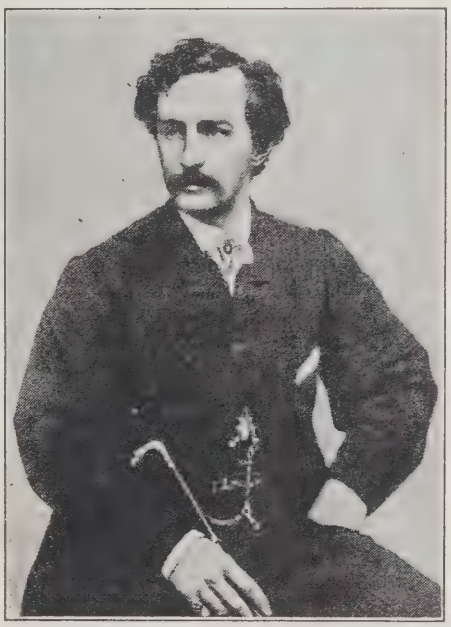
"In his transitions from the quiet and reflective passages of a part to fierce and violent outbreaks of passion, his sudden and impetuous manner had in it something of that electrical force and power which made the elder Booth so celebrated, and called up afresh to the memory of men of the preceding generation the presence, voice, and manner of the father. Convivial in his habits, sprightly and genial in conversation, John Wilkes Booth made many friends among the young men of his own age, and he was a favorite among the ladies at the National Hotel, where he boarded."[27]

George Alfred Townsend denies that John Wilkes Booth frequently cut his stage adversaries in sheer wantonness or bloodthirstiness, as has been claimed. He says that this mistake is due to confusing John Wilkes with the father. There is no question, however, that his habits after reaching manhood were always extremely irregular and that his progress on the stage was greatly interfered with by excessive dissipations.

It was during the Richmond engagement that the John Brown raid occurred, and Booth, joining a company of Virginia volunteers, took part in the capture and execution of the doughty old Reformer. He was inordinately proud of his "little share in the transaction and deemed that he was doing his duty in helping his country to perform an act of justice."[28] It was impossible for him to understand how what had been considered a crime on the part of 'poor John Brown" could later become a virtue, and he bitterly assailed the Republican party and the North for what he deemed a greater traitorism than Brown had committed.[29]

As a business man, John Wilkes Booth displayed considerable common sense, honesty, and ability. Amounts borrowed were always promptly returned, and although he spent money lavishly he "took note of his expenditures" and "kept his accounts with considerable regularity." It is said that his cashbook showed earnings of twenty-two thousand dollars during one season. Part of this he invested in Pennsylvania oil lands which proved quite profitable.

His initial star engagement was in "Richard III" at Montgomery, Alabama, where he first commendably played the part that his father loved so well. The tour that started with this success took him through many of the southern cities and ended in Boston where he "received special commendation for his enactment of Richard." He later appeared in this part in New York City but did not attain the success he expected. It is said that his acting was "too energetic to be correct," that it was "excellent in strong physical parts which did not require delicate characterization, refined conception, or carefulness." Like his father he had a penchant for collecting and reciting poetry which had made an appeal to his fancy. While the tears flowed down his cheeks, he would recite with fine effect his favorite selection, "The Beautiful Snow."



John Wilkes Booth.

In a memorable performance November 25, 1864, at the Winter Garden, New York, the three brothers, Junius Brutus, Jr., Edwin, and John Wilkes, played together in Julius Caesar, Junius appearing as Cassius, Edwin as Brutus and John Wilkes as Mark Antony. The proceeds went to a fund used in the erection of the Shakespeare statue in the mall in Central Park.[30] The brothers were accorded quite an ovation from the crowded house as they stood "side by side before the curtain."[31] This was the night of the Confederate attempt to burn the principal buildings in New York City. At 8:45 that evening Barnum's Museum was discovered to be on fire, a few minutes later several of the larger hotels, then warehouses and other buildings.[32] News of the conflagration reached the Winter Garden and had not the audience been calmed by a reassuring speech from Edwin Booth, the play would have been finished before an empty house.[33]

The letters of John Wilkes Booth and the reminiscences of those who knew him indicate that he would have joined the Confederacy had he not regretfully promised his mother that he would "keep out of the quarrel, if possible." The family, although from that part of Maryland, half southern and half northern in sympathy, was of unquestioned northern loyalty. Edwin Booth voted for Lincoln in 1864,[34] and had no patience with his brother's southern political leanings.

"It is evident that John Wilkes Booth was of the sensational type, with a will to strut and pose not held in check even under social pressure. His highly emotional nervous organization, inherited from the father, his tragic rôles, and his impulses and perceptions which had become perverted by his overwrought feelings, made him the easy victim of the suggestion to become the 'Brutus,'[35] in real life, that he had been seen on the boards."

Six weeks before the assassination of Abraham Lincoln he played at Ford's Theater in Washington, D. C., "his last mock part in this world," for "in this beautiful palace an outlaw had builded his fire, and slept, and plotted, and dreamed."

Old Duxbury

Home of the Clam and Quaint Folk

By MAY B. WHITING

Illustrated by Stanley W. Woodward

Captain's Hill and monument. Standish cottage in the foreground.

The grave of Miles Standish.

DUXBURY may claim to be the oldest summer resort on the Atlantic Coast. As early as 1630 Miles Standish, Elder Brewster, and John Alden built the first "summer cottages" on its shores, returning in the winter to Plymouth to insure attendance at church and to help guard the whole community in case of Indian attack. But the town today, with lawns and shaded streets, a stream of automobiles that scarcely stirs its comfortable somnolence, its harbor flecked with the sails of racing boats, seems very far removed from those days, or even from a later epoch when the name of Duxbury stood for sterling quality mixed with a measure of the eccentric and a generous flavor of the quaint.

Wait until the tide goes out. That will be the first token. Then the sailboats vanish or lie ignominiously tipped over on their side, and, where they careened so saucily, the Duxbury clam spouts in all his old-time glory. As if materialized from the froth of the receding billows, comes an army of diggers in costumes that would suit a comic opera, and at every turn of the rake the clam appears, white and glistening as when he greeted famishing Pilgrim eyes. He, at least, through unbroken ancestry maintains a very real connection with the past. But for him the sword of Miles Standish would have trailed in the dust and the romance of Priscilla have been buried in an untimely grave. Yet an ungrateful Republic heaped its honors on the more spectacular, but far less useful, eagle.

There Rises the Standish Monument

And by and by the tide comes rolling in, just in the nick of time, it would seem, to save the clam from utter extinction. Then the little sailboats lift their masts and make ready to skim again over this

"Bay of great surprises and unexpected lands
Which, when you least desire it,
roll up their golden sands."

But this very absence of deep water makes the harbor excellent for the racing of small boats. Clark's Island, and the long, slender promontory of the Gurnet offer shelter from the open sea, and, like a great beacon, there rises from the home shore the Standish monument, surmounted by a statue of the Captain looking out over the harbor which he so ably guarded.

This monument is the dominating feature of the region about. It is itself more than 200 feet high, and it rises from a bluff that was part of the estate granted to the Captain for his farm. Nearby lived his friend Brewster, on land bordering what has been called from his day to ours, "the Nook." The cellar of his house has been identified. A modest structure it must have been to have sheltered so much learning, for Brewster was a scholar, a graduate of Cambridge University, and, at his death, he left a library of 400 volumes.

Then There Was Priscilla

Miles Standish built near the highest point of the bluff and his house was no commonplace affair, but a V-shaped structure that was as much unlike the ordinary pioneer dwelling as the doughty captain differed from his good friends of the pilgrimage. This house was destroyed by fire, but some of the materials were used in the gambrel-roofed cottage built in 1666 by his son Alexander, and still in excellent condition. It is a charming house, but it does not suggest Miles Standish. It is too pretty, too much like other dwellings of the period.

The old cemetery, with its ancient, straggling trees and crumbling stones, is better calculated to awaken visions of the hero. Four large flags float from the corners of the fort-like monument that surrounds his grave and, with their shifting shadows, they make a vibrating, colorful tribute to the valorous spirit whom they honor.

I think there never was a nation so favored in its first martial hero, prudent in action in spite of hasty temper, an adoring father and tender nurse in time of illness, as Bradford especially mentions, always bearing the brunt of the danger, yet retaining just a touch of hauteur, perhaps because of hereditary rights in lordly estates across the sea. No wonder that when, in 1632, the church was gathered, and a few years later the town incorporated, they chose their name from Duxborough Hall, the ancestral seat of the Standish family. Seen through the afterglow of centuries, Captain Miles appears the very *beau ideal* of heroes.

But Priscilla Mullens did not see him in that light. At Southampton a youth, John Alden, joined the company as cooper. Some say that he was smuggled aboard for adventure's sake. At any rate, he was a valuable member of the company and throughout his life performed honorable service. Shortly after the Pilgrims landed, the whole band was divided into households to provide shelter for all, and he was assigned to the Standish family. Of the Captain's faint heart in courtship and its disastrous results to himself, we have been told many times. But he doubtless forgave the lad for winning the maiden himself and the two families lived for long years neighbors, as neighbors went in those days, on the lonely shores of Duxbury.

John Alden Built on a Little Knoll

John Alden built on a little knoll at the tidal head of the Bluefish River, near where a fresh-water brook, with the delightful name, Hound's Ditch, runs into it. The site is marked by a tablet and not far away is the house built by his son Jonathan. This house has been in the Alden family ever since its erection, and even the confirmed antiquary must confess that it has a charm all its own. The tiny room leading from the kitchen was John and Priscilla's, when, grown old in

good deeds, they returned to the homestead to pass their last days.

Doubtless John and Priscilla lie buried in the Alden corner of the old cemetery near their son Jonathan whose stone is still standing. Many of the monuments are crumbled past deciphering, but over one grave we clearly read,

"Aseneath Soule. The chisel can't help her any."

Surely not of Pilgrim days, that stone, but rather of old Duxbury of a later time when characters developed according to their bent without restricting influence of the struggle for existence or the modern easy means of communication to force them to a common mold. There are no monuments to mark that Duxbury; the sleek village gives slight trace of it, but perhaps in Duxbury woods there may be memories still green.

The very names sound encouraging as we journey along the dusty Cape Cod road. If it is spring the wayside is white with flowering plum and the air sweet with the breath of arbutus. We pass King Philip's path, Malachi Brook, Black Friar, and Happy Valley. At Four Mile Hill we pause to ask the way of an old man whose skin is wrinkled like an autumn leaf but whose blue eye retains the keenness that comes from searching the long vistas of the sea. He tells us that the hill is four miles from Duxbury Village, Kingston, Pembroke, and Marshfield. He also says that in his youth he knew a popular ballad about one who

"hired a cart to cart her round
From Four Mile Hill to Tarkiln Town."

Tarkiln, Tinkertown, Ashdod, and Crooked Lane are four little villages nestled in Duxbury woods. In the first there used to be, in stagecoach days, the "tree of knowledge," a great oak to which was nailed a box where the stage driver deposited the mail for the neighborhood and any passer-by might look for his own. Even Duxbury Village itself, apart from its main thoroughfare, so comfortably commonplace, except for the office of the Atlantic cable to Brest, is rich in names which recall the episodes of its history. There is Bumblebee Lane, Pucker's Hole, Wicked Hill, and King Caesar's Road.

This last leads to Powder Point where the Westons had their warehouses, in the days when the Weston fleet numbered a hundred sails. Their wharf still stands and the buildings which served as quarters for the slaves, but little else remains of those days of Duxbury's glory. Just across the flats, now spanned by a half-mile bridge, is Duxbury beach, the finest of the Old Colony, six miles long, but so narrow that there was constant fear lest the sea break through some day, rush over the flats, and sweep away wharves and houses.

The John Alden House.

Toward the middle of the eighteenth century Duxbury carried on the most extensive shipbuilding in the country. From here sailed countless vessels, among them the *Hitty Tom*, the *I Tell Ye*, and the *Mattakeeset*. This last was the Indian name for Duxbury, happily perpetuated by the local lodge of Independent Order of Odd Fellows. Ezra Weston himself received the name King Caesar, for the folk of Duxbury would allow no one, not even the wealthiest shipowner in the land, to put on airs unpunished.

Where today is there a bit of that village whose story is reflected by such nomenclature? Surely not in the antique shops where ancient glass and pewter jostle pell-mell with modern fads. The Rural Society is more promising. There you catch at once the keynote, hominess and sincerity. The people who have loaned their treasures for its rooms know Duxbury and in their reminiscences the character of the old town rises again like a shadowy vision.

There was Aunt Sarah Mac, poet and prophetess, who delivered an oracle in rhyme at every village incident. Offenders feared her more than the sheriff. When two young men were caught sawing a beam of the unfinished church, she exclaimed,

"And so you broke your saw!
But first you broke the law
Pray tell me what you did it for."

In this generation she might have been hailed as a *vers libre* genius, but then she was a lonely old woman, "queer," but always to be greeted respectfully because of her uncanny gift.

There was the minister, the Reverend Mr. Allyn. When any of his flock were led astray by Tom Paine's heresies, he would wrap himself in a sheet and pay a ghostly visit to the wanderer, who, shamed by his fears, would return in humbleness of spirit. There was Bidley Soule, of good family and not without intelligence, but who refused to so much as wash his face. At last the selectman built him a shack where he dwelt contentedly enough until an unfeeling medical profession forced him to take a bath and his demise quickly followed. Then there was Joseph Delano, commonly called Joe Dumit, who, long after the rest of the world had adopted more conventional attire, appeared every Sunday in church in bell-crowned hat, blue swallowtailed coat with brass buttons, yellow nankeen trousers, and high stock, truly a "last leaf upon the tree."

Such a quaint New England village cannot wholly lose its individual character. In spite of the ensnaring web of modern living, a little of its personality escapes, lending a charm that even a casual visitor must feel, although to find its source he must delve below the surface.

Like present-day parents, the Pilgrim fathers resented what they considered the low standards of those they found supplanting them in the younger generation and the incoming population. From 1629 to 1641 the population of Massachusetts increased from 300 to 3,000. Much of this population spread to Plymouth; hence the need for expansion which brought about the founding of a new town and a separate church. This enterprise proved the beginning of the ten neighboring towns that came to make up the Plymouth colony: Plymouth, Duxbury, Scituate, Taunton, Standish, Yarmouth,

(Concluded on page 27)

Putting the Lid on Profiteering

(*Continued from page 7*)

officials in their acts, where the evidence is sufficient, are supported by the public, unfair methods of competition and their progenitor, monopoly, will not be met successfully.

Perhaps our nation will not arrive at this state of mind until the average citizen, searching his conscience and patriotism, puts the question to himself seriously: "Am I willing to be a satisfied underling, or a dissatisfied free man?"

What Takes Place Behind the Scenes

That last quotation was given to me by one of our greatest thinkers and best-known public men, who, because of his high official position, forbade my using his name, when I asked him to phrase his idea of the problem confronting the people of America. How many of us, when put to the test, will battle for the greatest boon that our ancestors have given us—*economic and moral freedom?* If such a question were put to the average audience, the chorus of answers would certainly be heartening. But let there arise a contest between the government and a dominating corporation in any one of our industries today. Come then behind the scenes with me and watch the terror that strikes the heart of the small competitor who has made the complaint, when he is asked to take the witness stand and testify to what he knows and has stated confidentially. Many have pleaded piteously not to be forced to subject themselves by testifying to the reprisals of the one against whom they have complained. In some cases, they have gone so far as to say that they would refuse to testify, that they dared not risk ultimate ruin. Rather than do so, many are willing to accept the crumbs that fall from the table of special privilege. Time and again these men have said that they live only by the consent of the colossus of their industry. One wonders what such men think as they sing "My Country 'Tis of Thee, Sweet Land of Liberty."

Only recently when one of the great mergers took place, I was pestered with information by one who was employed by one of these organizations, as to each step that was to be taken by the combiners. His hope was that there might develop some way by which the combination could be frustrated. When I asked the reason for his anxiety, he told me that consolidation meant either that he would be let out or shoved down the line because his company was the smaller of the two.

When our American citizen arrives at the state of mind and shows the same spirit against monopoly and for the competitive system that I have seen exhibited in Europe by the coöperative where a member of a coöperative organization would walk six miles through all kinds of weather to his coöperative store, rather than purchase around the corner from those who were monopolizing or controlling the market place, then we shall be able to handle monopoly more successfully.

To assist honest business effectively the Federal Trade Commission must be given the tools and machinery to carry on. Not more power, but a more clarified power is the necessary requisite for the Commission. Instead of being given the authority to rule in advance which would necessitate the building up of a great bureaucracy of thousands of employes, the legislation creating the Commission should be so clarified that it can act with greater speed and effectiveness. As it is now there are hundreds of cases awaiting investigation and trial by the Commission. One of the reasons for this is that the courts have by a decision injected a delay into the Commission's procedure which, if measured in working days, would total up into many working years. When a case is started by the Commission and after it has made investigation and gathered the data from the field it places it before a group of three men in its employ known as the Board of Review. Their opinion and the facts are passed along to the Commission. If the Commission issues a complaint, it states its charges and serves the same on the proposed offender.

A Question Regarding a Monopoly

The very first order of the Commission that was appealed from and carried to the Supreme Court of the United States involved the manner in which the complaint stated the charge against the offender respondent. In this case the respondent manufactured and sold a large proportion of all the steel ties for baling cotton and controlled the company that sold 40 per cent of all the bagging used to incase cotton bales. The charge was that it forced those buying the steel ties also to buy the cotton bagging. This, the Commission thought, in view of the dominance of the respondent over the sale of ties, was unfair.

Now, in most of the cases that the Commission starts it does not and cannot know all the facts, but it does know the unfair method that is being practiced and can so describe it. The one charged, however, is fully protected from surprise by a rule which compels the Commission to present all of its evidence to the respondent before he puts his witnesses on the stand. The Commission did not know whether the respondent had a monopoly or a practical control of the articles in question, and so it did not state in the complaint that there was a monopoly. However, the respondent on the stand admitted its dominance and co of the price of the ties. Neverth the court set the Commission's o aside because it had failed to char monopoly.

In hundreds of complaints is since the decision in that case the C mission, which gives the one cha approximately forty days in whic answer, has been compelled, upon covering new evidence, although it set forth the unfair method of petition in detail, to withdraw complaint, prepare and serve a one, and allow an additional days. The number of instances, have said, if totaled up, would n many working years and has ca innumerable delays in the Com sion's efforts to bring about spe action.

Commission Has No Criminal Jurisdiction

Moreover, Commission have its po clarified as to rights to investigate combinat associations and groups that are bl ing the channels of trade.

No one questions that a man the right to protection from search seizure of his person, or his offic his home, nor would one contend he has not the right to refuse t criminate himself where there criminal liability involved. But Commission has no criminal juri tion. It can't send any person to nor fine, nor punish him. All it ca is to tell him to stop and if he doe obey them it must go to a court ask the court to see that he s If the Commission is to put the mate consumer on an equal basis the seller in the market place, th must have authority especially there are apparent monopolies, binations or associations contr production, or the prices of commod to acquire the data and inform in respect to business and to give information out to the public rently so that it can be infor Otherwise the question of any att to meet this great problem suc fully is foredoomed.

Take the situation that the mission found itself in immedi after the war. It had been calle fore a Committee of Congress t what it thought was the cause o high cost of living. It replied th did not know whether there w high cost of living, and suggested if Congress would give it $150,00 expenses it would try to get the

Upon the consent of Congress with an appropriation of $150,00 this purpose, the Commission b its work. It was acting, not only u the language of the act appropri the money, but upon the langua the act creating the Commission wi gave it the power "to gather and

ile information concerning, and to investigate from time to time the organization, business, conduct, practices, nd management of any corporation ngaged in commerce." It set up the achinery for getting current reports n coal and giving them publicity and as intending to do likewise with steel, il, lumber, and the other principal ecessities of life.

The Commission believed that if very thirty days it could give the ublic a picture by districts and without naming any corporations, of the roduction, prices, and amount of tocks on hand in an industry, it could nform the public and quiet it so far as rices were concerned, when the data f the Commission warranted it. Such nformation would prevent an artiial market with prices not supported y supply and demand. In addition o this, the Commission believed that his information would have a quietng effect upon any imminent labor roubles. In the case of an impending trike, it would have the information eady to place on the table between mployer and employe. Thus there ould be informative facts upon which he public could determine which side to support.

What Is a Reasonable Profit in Coal?

Some time previous to the beginning of this work, the National Coal ssociation had written a brief in which admitted, even contended, that the ommission had jurisdiction to acquire uch information from the industry. he Commission was working in the Vest Virginia coal district and had arned that $4.50 was a fair price at he mouth of the mine for the cost of oal, including a reasonable profit, hen it was called upon by Admiral enson of the Shipping Board to nform him why he was compelled to ay approximately $22 a ton at idewater. The freight rate to tidevater was about $2.

The Commission was very close o the facts when the National Coal ssociation, through a certain cororation, brought injunction proceedngs to stop the work of the Commission n the grounds that the mining of coal as a thing that took place within a tate and that the Commission had no uthority to go ahead on matters ntrastate, and only had jurisdiction o collect data about coal that was o cross state lines. Since that time, hich was in 1919, the Commission as been under restraint of a court njunction, and its rights have not yet een finally determined. Should it ventuate that the government does ot have the power to gather data rearding coal or any other commodity om its raw material state to the final elivery to the ultimate consumer, hen I do not believe it will be able o deal effectively with the trust and rice problem.

To understand this price and trust roblem Congress must have all the facts before it at one time. If it does not then when prices are high the retailer may pass the blame along to the wholesaler, and the wholesaler to the manufacturer or producer, and no one will be able to say who, if any one, is at fault.

Moreover, if the Commission is to protect the public and act in behalf of honest business, then the authority granted to it by Congress of preventing one competitor from buying out another where the effect is substantially to lessen competition, must not only be clarified but reinforced since combinations have become the order of the day. The Commission law requires it to make an investigation and have a trial which often is quite extensive and consumes considerable time. As I pointed out, if during that time the combination goes ahead and takes its chances it can so intermingle the business of the units which it combines that it becomes an almost impossible problem to separate them, when the Commission is finally ready to act.

To correct this situation the Commission should be authorized, where a combination is announced to take place and the substantial wiping out of competition appears fairly ascertainable, to go into court and ask for a temporary restraining order until it can have a reasonable time to make an investigation of the facts. Such an authority would not make the Commission paternalistic, for its action would at all times be under the control of the courts, and since the policy and language of our legislation from its beginning has been against combinations this negative action which the court would grant for a reasonable period in proper cases could not be classed as paternalism.

Today the Commission has only the power to halt combinations where one purchases the capital stock of another. To escape the restraint of the law some of those combining have bought only the physical assets of the competitor and thus believe they have combined "within the law." It is obvious that the law should forbid the purchase of physical assets as well as the capital stock of a competitor.

Like Unto One of the Plagues of Egypt

Summing up the whole question of government and business in relation to combinations and price control, it is evident that there is no problem more difficult and no subject so important to the welfare of our people and our country, for, as Lord Culpepper said in the House of Commons, in the Long Parliament in 1640:

> "These men, like the frogs of Egypt, have gotten possession of our dwellings, and we have scarce a room free from them. They sup in our cup, they dip in our dish, they sit by our fire; we find them in our dye-vat, wash-bowl, and powdering tub; they share with the butler in his box, they have marked and sealed us from head to foot. . . . they shelter themselves under the name of a Corporation; they make by-laws which serve their turns to squeeze us and fill their purses."

Old Duxbury

(*Concluded from page 25*)

Barnstable, Marshfield, Seeconck and Nausett.

According to the old records, the new settlers were a miscellaneous set, composed for the most part of "unruly servants" and dissipated young men, whose ill conduct caused old rulers like Bradford to question "whether after 20 years' time the greater part be not grown worser." These people increased in their "outward estate," and as they scattered in search of fertile land, Plymouth, "in which they lived compactly until now, was left very thin and in a short time almost desolate."

It was in this Plymouth colony that the representative system of government was definitely introduced. As the settlements increased, it became inconvenient for the freemen to attend the general courts in person. It was, therefore, agreed that Plymouth be allowed four delegates and each of the other towns two, and they, with the governor and his council of assistants, constituted the lawmaking body of the colony. To be entitled to hold office or vote at the court, the person had to be "a freeman"; and to acquire this character, he had to be specially chosen one of the company at one of the general courts. Thus in the beginnings of our government, suffrage was regarded as a privilege and not a right.

When Witchcraft Was a Capital Offense

Although the first of the colonies to establish a Separatist church, the Puritans of Plymouth did not make church-membership a condition of citizenship. Still, there is little doubt that this restriction prevailed at Plymouth, since up to 1643 only about 230 persons acquired the suffrage. In the general laws of Plymouth, published in 1671, it was provided as a condition of receiving the franchise that "the candidate should be of sober and peaceable conversation, orthodox in the fundamentals of religion."

The earliest New England code of statutes was that of Plymouth, adopted in 1636. It was digested under fifty titles, and recognized seven capital offenses, witchcraft being one.

Did Man Know the Dinosaur?

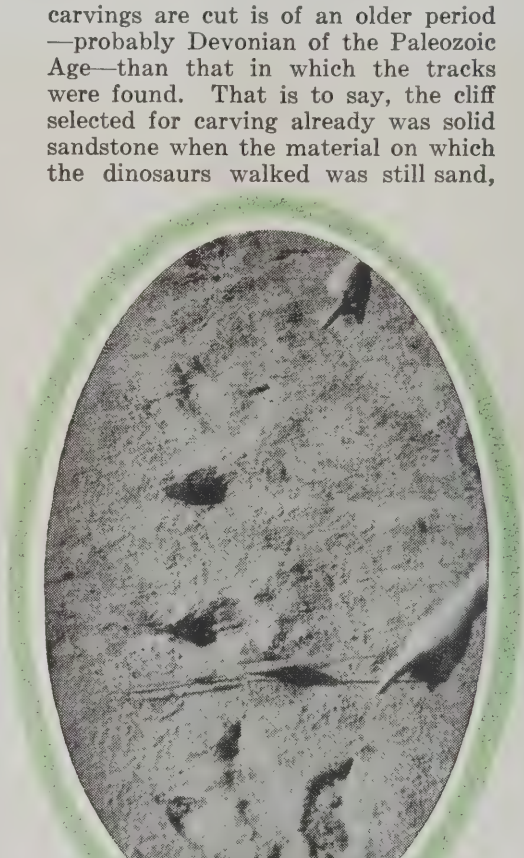
(*Continued from page 17*)

important of all, the drawing of the dinosaur in the position, reared up on its hind legs, in which man would be most likely to see and remember the huge lizard, the attitude it assumed when feeding from the lofty and luxuriant vegetation of its period. The fact that the prehistoric artist endeavored to portray the dinosaur using its tail as a balancing stick, just as do the larger lizards of today, indicates that the man was at least somewhat familiar with the more obvious habits and actions of the creature.

"That dinosaurs were in this vicinity was proved later by our discovery of tracks in considerable numbers, which were identified by Professor Gilmore as belonging to one of the carnivorous dinosaurs. We found these tracks some distance into the Painted Desert of Arizona, about 100 miles from the drawing of the dinosaur. Their exact location is about eight miles west of Tuba City. The plainly visible clawmarks led Dr. Gilmore to identify their maker as one of the flesh-eating dinosaurs, rather than the herbivorous type. The pink cliffs of the 'Jura' surrounding the level stone on which the tracks are imperishably engraved, and the stone itself, easily identified the formation as of the Triassic period of the Mesozoic Age. The footprints of the giant lizard were impressed in the sandy shore of what had once been a lake or sea, but the sand had long since turned to stone. There were three sets of tracks, made by individual dinosaurs of differing sizes, in a small area which had been uncovered out of three or four feet of sand by either a cloudburst or a miniature tornado. Clearing away of a large area of this Triassic stone still covered with sand probably would reveal still other tracks. Possibly there are eggs of the dinosaur to be found in this region as well; indeed, until our party went in, the area never had been explored by white men.

"The largest of these tracks were 16 inches long by 14 inches wide, and the stride was 52 inches from heel to heel. Between the tracks were two depressions, believed to have been made by the tail of the dinosaur when the big lizard raised itself on its hind feet. We made plaster casts of the tracks and photographs of them, while Dr. Gilmore took careful measurements of a dozen or more of them, and made sketches to illustrate their depth and position. To revert for a moment more to the drawing of the dinosaur, its dimensions are: Height, 11.2 inches; greatest width, 7 inches; length of leg, 3.8 inches; length of body, exclusive of tail, 3.9 inches; width of body, 3 inches; length of neck to top of curve, 3.5 inches; length of tail, approximately 9.1 inches; length of neck approximately 5.1 inches. The primitive artist was so anxious that this picture should be preserved long after he had passed away that he not only cut through the 'desert varnish,' but also engraved his lines about one-fourth of an inch deep in the sandstone itself. This depth enabled us to make a virtually perfect cast of the figure, usually a difficult result to obtain with Indian cuttings, because the makers do not carve their lines deep enough to receive the casting material.

"The sandstone in which these carvings are cut is of an older period —probably Devonian of the Paleozoic Age—than that in which the tracks were found. That is to say, the cliff selected for carving already was solid sandstone when the material on which the dinosaurs walked was still sand,



Petrified footprints found in sandstone of the Painted Desert by Doheny expedition, and identified by Dr. Chas. W. Gilmore of the United States National Museum as those of a carnivorous dinosaur.

waiting to be hardened and laid down as Triassic stone. Probably the river—or at least *a* river—washed the base of the cliff when the primitive artist drew his dinosaur with a sharp-pointed piece of flint. Today, the river is considerably more than 20 feet below that drawing, having carved its downward way that far in solid rock, in the time which intervened between the making of the drawing and the present day. If, however, as Dr. A. C. Lane, of Tufts College, has suggested recently, the Earth is approximately one and one-quarter billions of years old, the matter of man's antiquity running back ten or twelve million years to the time of the dinosaur ceases to be a tremendous stretch of time. logically, the day of the dinosaur yesterday, as man considers days.

"But, if this is a drawing dinosaur—and what else is it inter to represent?—either man goes in geologic time to the Triassic pe of the Jurassic Age, which is appr mately 12,000,000 years further than any scientist will now admit man existed on earth, or, the dino came down into the so-called 'ag mammals,' including man. Al side this picture are symbols clo resembling the Greek sign of M showing the shield with the spear projecting above it. In these, an these only, the deposit of iron begun to appear, indicating that are of the greatest antiquity.

"In any event, that drawing on wall of the cliff in lonely Hava S Cañon is eloquent, though du It says:

" 'The man who drew me made used *tools*. He had the *patience* chip an outline which he first had *intelligence* to draw on hard stone crude flint, and he had the *persance* to finish the job to which he set himself. He had an eye for *f* and a sense of *proportion*, no ma how crude we may consider th sults today. He had the *judgme* select a medium which has prese his work through uncounted— even unguessed—ages. He seen have had some sense of a debt t fellow men, for he here posted ar perishable *warning* to them that beware the dinosaur, because it dangerous to man. He must, have felt that *urge to create* s thing, which puts man into kin with God.'

"Standing before this dra the thought came to me that apeman, if there ever was su creature, is still lost in the whelming eons of time. It occu to me that the Neanderthal or the Java Man, may be no n to the First Man than we Amer are to the 'Dawn Man,' discove whose skull some years ago set scientists of two worlds by the It must be apparent to the th that the Power which rules this all other universes cares nothing fo individual, but everything for species. Is it not possible, nay, prob then, that in developing the animal, there have passed across earth myriad species of that an 'lower than the gods and higher the apes'?

"On the same wall with the graph of the dinosaur, about 15 from it, we found another drawin carving, evidently intended to r sent an elephant attacking a The animal is striking the man his trunk, and the man has both

praised, either in fear or in supplication, possibly both. The wavy line which cuts off the man's feet apparently is intended to represent water, into which it would seem the man has retreated up to his knees. The elephant has no tusks, indicating a female. The remains of elephants are not uncommon in many parts of North America, three varieties being represented—the mammoth, the mastodon and the imperial elephant, the latter the *elephas imperator* of California. A complete skeleton of the imperial elephant, from area deposits near Los Angeles, is now in the museum of that city. It stands fourteen feet high at the shoulder, as compared with the nine or ten feet of the largest African elephants of today.

"There is no means by which we can tell whether the elephant was drawn before or after the dinosaur carving, but the former picture may be taken in support of the opinion expressed by Dr. Frederick A. Lucas, director of the American Museum of Natural History, that while he believes that man and the elephant were contemporaneous in America, yet there is no record so far found to prove this belief. The pictograph on the wall of Hava Supai Canon presents that proof.

The mysterious footprints in the red sandstone of the Grand Canon of the Colorado, which have not yet been identified. Nothing like them is known to archeologists.

"The elephant figure is approximately 7.5 inches high and 0.3 inches long, exclusive of the trunk. The figure of the man, from the waterline at the knees to the top of the head, is 7 inches in height. It appears to have been the intention of the prehistoric artist to draw something in that hand of the man which is extended away from the elephant. The first rude outline scratches of the flint for this detail of the picture can be seen, but there is nothing to indicate what the object was which the early stone-etcher planned to draw. Possibly it would have been a spear, possibly a stone hammer, maybap merely a large stone; the failure of the man to complete the drawing, after showing his intention of so doing, raises the interesting but unanswerable question: 'Why did he quit?' and 'What became of him?'

"But our discoveries did not end with the dinosaur and the elephant. In three different places in the Hava Supai Cañon we found pictographs of the ibex, a long-horned antelope which still exists in Asia, but of which no trace, either in bones, fossils or pictographs, has ever been found in the New World. One group, showing a male and two females, was directly under the elephant picture, but close to the ground. These showed the effects of weathering, indicating their great antiquity, and in some parts were quite indistinct, though the outlines could be followed with ease.

"About a mile up Lee Cañon from its junction with Hava Supai Cañon, however, we came on a large smooth panel of red sandstone, well sheltered from the elements. There was no black surface on this stone, so the figures were carved about one-fourth of an inch deep, showing a very high type of workmanship, much better than either the elephant or the dinosaur, and quite evidently of a later period. In order that there might be no mistaking the animal which the primitive carver wished to portray, he also carved two deer and three or four mountain sheep into the picture with the seven ibex. The picture shows several hunters driving the animals into a trap or through a pass in the mountains; it is difficult to say which. Roy Chapman Andrews, head of the expedition to Asia which found the dinosaur eggs, and who has hunted ibex in Asia, unhesitatingly pronounced these figures to be those of ibex. He identified them most strongly by the knobs on the front surface of the horns, a characteristic possessed only by the ibex among all horned animals. In a cave near Alpera, Spain, there is a drawing showing men hunting ibex with bows and arrows, but the pictographs I have described above form the first appearance of this animal in America.

"In the main grand cañon of the Colorado, we found a fortress or stronghold of prehistoric man, built of large blocks of stone, on top of a small but isolated mesa. Near it, we found tracks in the red sandstone which have not yet been identified. The present Indians know nothing about the fortress or its builders, and still less about the mysterious oval tracks deep-bedded in the sandstone. There are miles upon miles of this Grand Canon country which no white man has ever seen, and the Doheny expedition found enough in its brief visit to convince every man on it that here lies a veritable mine of archeological treasures. There are enough unexplored pictographs, burial places and other similar remains in the Hava Supai Cañon alone to keep a large party of scientists busy for several seasons."

Are We Living Off Our Children?

(*Concluded from page 2*)

ments are chiefly to blame for this piling up of indebtedness, and in the mismanagement of credit. Borrowing money through the issuance of bonds is too easy. It is becoming a habit with our city, county and state authorities. And the result is something like this:

In 1912 the per capita indebtedness of the United States was $49.97. Today the per capita indebtedness stands at $283.70.

Including interest, the Illinois roads provided for by a recent bond issue of $100,000,000 will probably cost, before the issue is retired, in excess of $300,000,000.

There is nothing of news in the remark that the financial standing of European nations is not healthy. Here is one reason, found in an analysis of the figures presented by the New York Trust Company: Of the $788,-005,000 financed in this country by foreign governments during 1924, over $210,000,000 was for the purpose of refunding old debts. The total of all classes of financing in the United States last year was $6,327,086,000—of which almost one billion dollars, or nearly one-sixth, was for refunding. Unless we reverse our tactics, that one-sixth will grow to a much more formidable fraction by 1935, 40 or 50, when many of the road, school, bonus, and "improvement" bond issues mature.

We have developed a terrific credit inflation—and somebody must pay the fiddler. In business the man who misuses credit fails. In government, unfortunately, the politician who misuses credit "points with pride" to his supposedly economical administration. When we see 16.5 cents out of every farmer's dollar going for taxes (as against 8.7% in 1910) we wonder how long we can stand the strain—how long it will be before something cracks. We are not paying as we go, and unless we get back to that fundamental principle soon, we will leave posterity a fine crop of promissory notes as heritage. Just now we are living pretty much off the kids.

The High Cost of Selling—and Buying

(*Concluded from page 3*)

ful in some particulars, but those who talk most about waste never mention the ways in which we waste the most. Our manufacturing and selling systems are our weak points. When it costs but a fraction of the retail price to make an article it might seem as if our manufacturing methods were very efficient, but this is not so. It merely shows how much worse are our selling methods. Able manufacturers know how much room there is for improvement in the efficiency of manufacturing methods. They are appalled at the lack of imagination that they see all around them. This is because men are managing industries who cannot go out into the works and perform the simplest mechanical operation. These managers are not mechanics. They are business men who are managing something about which they know nothing. The cost of manufacturing will be still further reduced when we have the right kind of men at the head of industry.

But what about the cost of selling? Must it remain high forever? There is some excuse for high prices in connection with new things that are passing through the experimental stage, but what about standard articles that have been before the world for a long time?

It would seem as if the cost of selling such things should come down. But what about watches? Watches are not a novelty, yet Mr. Tripp informs us that it costs six and one-half times as much to sell as it does to make them. What about fruit, vegetables and milk that cost five times as much to sell as they do to produce?

Let us first consider cheap watches. Are dealers making exorbitant profits? It is very unlikely. Cheap watches are now mostly carried as side lines in cigar stores, drug stores and similar places that are located where the tides of travel rise high. This means areas where ground rents and building rents are high. In large cities it is astounding to learn what tremendous rents are charged for small stores. Before the proprietor of such a store can have a cent for himself he must pay for his stock, pay his employes, and pay his rent. When you buy a cheap watch in New York it is more than likely that you are also contributing to a fund to enable Mr. Astor to buy more real estate from which to collect more rentals. The cost of selling cheap watches and everything else is in part made up of the cost of maintaining gentlemen who own land upon which others do business.

Milk, vegetables, and fruit not only pay tribute to the landlord but they are further handicapped by a system of distribution that is wasteful in the extreme. The only good thing that can be said of this system is that it works. Nobody who can pay six prices for what he wants need suffer. It is true that the farmers who produce these things show few signs of affluence. They complain that they are doing business at a loss. But their products, after passing the hands of a long line of middlemen, do eventually reach consumers, and to this important extent, the system works.

Human beings have to learn to creep before they can walk, and our present methods of distributing things are obviously the most efficient methods that we have thus far been able to work out. But efficiency is a word of which we never heard until day before yesterday and, before we are through, we shall do much with it. We shall learn that the shortest line between the producer of farm products and everything else and those who consume them is the line upon which goods should travel. When farming is organized and systematized, as it soon will be, farmers will deliver their own products to consumers and collect what the consumers pay. There will be no lost motion between the points of production and consumption. We are already equipped to make the change. We have the roads and the motor trucks that are needed for transportation. All we need is the organizing ability. Nor need there be anything in the nature of hit or miss about it. The city market can be studied to see what and how much it wants. Definite orders can be obtained. Having gathered this information, a group of farmers can set about it to produce those things for which there is a demand and one farmer can deliver w a dozen other farmers raise.

It costs a lot to live now bec*so large a percentage of the popula is engaged in doing things that nothing to the worth of merchandise do add enormously to its retail p* After a thing is made, nobody ca anything to add to its worth. most that anybody can do is to p in the hands of the consumer. Th largely a matter of transportat Transportation is a necessary ser and should be paid for but it does cost much. It is the creation of mar for new things and the strugg among competitors to determine shall get the profits that cost.

About the best the world has been able to do is to learn one le at a time and flunk the others. have at least learned a great deal a production. Much as we still hav learn upon this subject, we now k how to produce more of everyt than we want. And that is somet that could not have been said, eve late as George Washington's time.

We shall soon learn how to things—not for seven times wha costs to make them but for a s fraction of their manufacturing Some manufacturers are doing already. What they are doing e manufacturer will eventually Middlemen are often an added exp without being an added service.

And no person whose labor to the worth of an article shoul permitted to add anything to retail price.

John Burroughs as I Knew Hi

(*Concluded from page 5*)

being subjected to talk which roiled him, or which, if thought-provoking, interfered with digestion. "And then," a bit defiantly, "I go to the table to eat—to masticate—and you can't do that and chatter." However, during the last decade of his life he was weaned from his silence at meals to a considerable extent, and came really to enjoy a cheery atmosphere at table, to which he contributed not a little.

Much as he loved the wild flowers, he had little liking for cultivated flowers, except a few old-fashioned ones. In one of his early letters to me (apropos of the value of the natural over the artificial), he wrote: "I care nothing for garden flowers, or those you can get at the florist's, but when a schoolgirl offers me a bit of arbutus, she touches my heart . . . I had rather have one pint of wild strawberries than a gallon of tame ones." The roses and carnations of the florist's, like sophisticated beauties of the drawing-room, made little appeal to him; and he would look unmoved upon chrysanthemums that would seem to chall the admiration of anyone suscep to form and color. When rallie his coldness, he replied, "How arti they look! They lack the modes Nature." For the papery hydrange had only contempt, while for the cri rambler he felt a positive aversi "soulless, scentless, flaunting thing

It is difficult to single out a his many favorite flowers thos best loved, but perhaps they were blossoms, arbutus, hepaticas, lilies, the various cypripediums, the glowing, regal bee-balm w haunts the mountain streams o boyhood. Among trees, he had sp fondness for the maple, the b "the girlish birch," and the ash t this last for the subtle gradatio color in its autumn foliage.

In literature, as in life, he was attracted by the qualities of simpli genuineness, clarity, and feeling. book, to attract me," he said, "i teach me to know something bett to love something more. The books do both."

Within the Walled City of Manila

Architectural Dreams Full of Romance

By WILLIAM L. STIDGER

One beautiful corner of the Walled City.

THERE are three Manilas in our island possessions, the Philippines.

There is that Manila within the Walled City; there is that American section outside of the Walled City; and there is the section where the Filipinos live. These three cities are as different as they can be; and all fascinating.

There are three great groups of people who live in Manila: the Americans, the Spanish, and the native Filipinos; and all three have a history, customs, and habits, all their very own.

The American population is made up of the army and its followers; civil employes in the government and schools, and American business men with their families who have gone to the Philippines to make a fortune or a living—as the case may be.

The Spanish group consists mostly of the descendants of the Spanish régime who have grown up in Manila, and to whom it is home; who live their own lives, in their own way, in a sort of a regal excellence due to money accumulated in the olden days when exploitation of the people was easier than it is now. The Spanish group lives in a bygone romance of luxury and with an atmosphere of monarchial splendor such as we seldom see in these days, even in European courts.

The native Filipinos, mostly Tagalogs, who live in Manila live in their own section of the city, in thatched houses, raised up on platforms above the reach of snakes and water, in almost as primitive fashion as the natives live back in the interior of the Philippines. This section of Manila is the most fascinating part of the city and this group the most interesting.

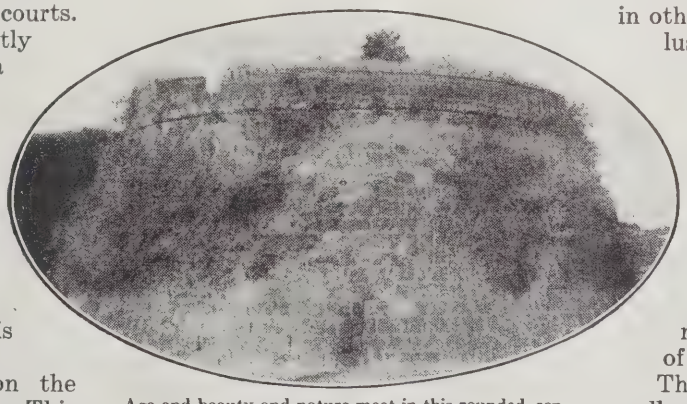
One ought also to mention the great Chinese group in Manila. This group lives in a section by itself within the Walled City, and among these Chinese merchants are some of the shrewdest and richest citizens of the city.

Natural-born traders, these Chinese have come over to Manila from Hongkong, and Canton, and they have established themselves so securely that they are a respected and a permanent part of the life of the city. Dr. Sun Yat Sen raised more than a million dollars among these Manila Chinese to overthrow the Manchus and he has always been liberally supported by them. During the World War these Chinese were most generous in their support of our great American drives.

That portion of Manila which lies outside of the walls of the city is the more modern of the two sections. The Americans and Europeans have their beautiful homes outside of the walls. The beautiful Luneta is also outside of the walls of the city. This is a great public square facing Manila Bay, where, each evening the Constabulary Band plays. Here gather men of every race and color on earth each evening to hear the band and watch the indescribable sunsets down behind the mountains of Cavité, and to while away a leisure hour at the twilight time. This is one of the great public institutions of the city: this twilight hour on the Luneta, and the band concert.

Intramuros they call it, and so are marked cars, that come and go through the walls of this interesting city. Step inside of those walls, or ride through them in an automobile, a street car or a carretela, and you have suddenly been transferred from a modern world into an ancient civilization.

The walls are useless any more.



Age and beauty and nature meet in this rounded contour of the Walled City of Manila.

But thanks to the good sense of the Americans they remain, the most fascinating and romantic thing about the islands. It would be like tearing down a monument to tear down those ancient walls. With the single exception of the Chinese Wall, which I have visited, the walls that surround the city of Manila are the oldest in the Orient and the most interesting.

I walked around these walls on the outside a dozen times during my two months in Manila and I never tired of the constantly changing panorama of church steeple, dome, tower, and minaret. Its white interior buildings, its barred convent windows, its Spanish architecture, its secret suggestion of bygone days, as seen from outside the walls, fascinate one. The picture never grows old. I have watched a dozen sunsets over that Walled City. I have watched the great church domes of golden splendor fired with the rays of the setting sun. I have looked over the tops of these wonderful walls at dawn and have watched the morning sun gild dome and tower until it looked like the Eternal City or the Celestial City of the vision of John of Patmos. One never has caught all of the splendor of the Walled City of Manila until he has watched several sunsets behind its walls and until he has risen early in the tropical dawn and watched the day arise behind those walls.

One is conscious of the fact, as he looks upon these walls, that they have borne the brunt of the attack of hundreds of pirate European and American invasions from the beginning of the Spanish régime and that over these walls climbed the American soldiers when Dewey captured Manila. The streets of this Intramuros have rung with shot and shell. Blood has run in rivers down these cobblestones in other years. Intrigue, plot, murder, lust of priest and people, has centered within this one square mile of walled romance.

The entire city of Manila consists of twelve to fifteen square miles but that portion within the walls is only one square mile in extent; yet within this single square mile of walled city there are more historical and architectural monuments than in all the rest of the United States put together.

The entrances through this ancient wall are in themselves beautiful architectural dreams, and regnant with historical romance. A study of the walls from the outside is not complete until one has looked upon the contour and beauty of every single entrance.

One of the most beautiful is the old Parian Gate, with its strange buttresses. Another is what is called Puerta Real, small and just behind the

great Manila Cathedral, with its ancient dome showing above the walls at this point. Isabella II is another beautiful arched entrance.

There is a continual stretch of almost three miles of walls surrounding this square mile of city. The first wall was built of logs back in 1570 and as early after that as 1574 the first attack came under the Spanish régime. It was made by Limahon, a Chinese pirate with 2,000 soldiers and a Japanese General in command. The Spanish drove off these pirates.

In 1590 Governor Dasmarinas came out from Spain with authority to build a permanent wall to protect Manila. This construction began at Fort Santiago, and this first section of wall still stands after more than 300 years of varied history.

The walls were well tested in 1603 when a Chinese rebellion took place which lasted six months, and when it was over, 24,000 Chinese were killed—utterly wiped off the face of the earth, as was the Spanish fashion in those days.

Juan de Silva began work on the walls again in 1609, and, in 1620, his work was taken up by Nino de Tabora, and followed up by Diego de Fajardo in 1644.

When France and Spain united to conquer Great Britain, that nation sent a fleet to capture Manila and, in September of 1762, thirteen British ships commanded by Admiral Cornish entered Manila Bay. The Spanish to the number of about one thousand trained men were driven into the Walled City and were besieged by about 2,500 British who at once began to pour 24-pound shot into those beautiful walls. The British shells made a breach in the walls and the Spanish surrendered on October twenty-fourth. This surrender was followed by a week of debauchery and licentiousness; stealing, rapacity, and murder such as makes Great Britain blush with shame to acknowledge. In the famous Treaty of Paris the islands were again given back to Spain.

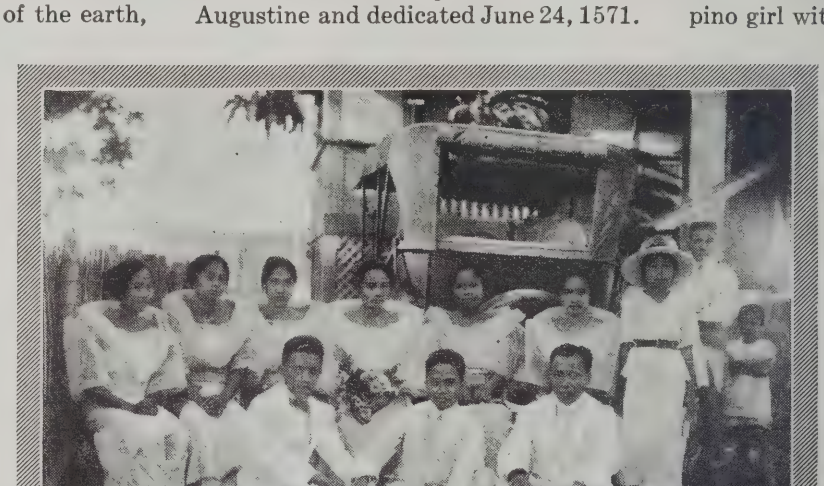
There were originally seven gates, and five of them still remain. Up to 1852 the gates were religiously closed promptly from eleven o'clock at night until four in the morning and Spanish watchmen guarded the city pacing these walls.

The heart and soul of Intramuros is Fort Santiago.

It is the oldest section of the wall, and around it centers all the history of the city. Three flags have floated from its staff. The Spanish flag floated unmolested for 348 years. Then for a brief period the British flag fluttered in the tropical winds from Manila Bay. Then came the Stars and Stripes which still flies over those ancient walls, that historic fort, and that medieval city within the walls.

Within this old fort, General Merritt met the Spanish governor-general and arranged for the American occupation on August 13, 1898. In proud contrast to the British occupation in 1772, the American occupation came about quietly, in decency and order, with no bloodshed, no robbery or burning of buildings or tearing down of churches.

One of the characteristics of the Intramuros is her cathedrals and churches, of which there are more than two hundred. When we talk about the United States being overchurched in her smaller communities we are right, but here is a city that has two hundred in a single square mile. They are all old and beautiful, the oldest being at the corner of Calles Palacio and Real and it was erected by the order of St. Augustine and dedicated June 24, 1571.



Filipino girls and young men of Manila.

Of the three most historic and beautiful churches within these walls the Cathedral is the largest and most impressive. It is Byzantine in style, has been destroyed four times by fire and earthquake, has nine entrances, three beautiful chapels of a larger size and many smaller ones, and it took seven years to build it.

The second church of interest in the three is the Jesuit Church on calle Arxobispo. Its beauty of architecture, decoration and art is unsurpassed even in European cathedrals.

The third of this trio is the old Santo Domingo monster cathedral with its towers, buttresses and domes, stately and majestic. Its great dome is visible over the walls of the city for miles. It is the only Gothic interior in the city.

One Easter morning I visited this great church and more than five thousand candles were burning about the altars, the American priest told me, while three thousand persons knelt in worship. The incense filled the high Gothic interior with mist and perfume and the chanting of the choir boy shall never forget. The great beautiful organ rolled its melody through the open windows and could hear it long after I had left cathedral and had gone outside of city walls.

Side by side with these hist associations which have seen the mance of four occupations; side side with these aging cathedrals, vents, and monasteries; side by with these white-robed priests Spanish señoritas walk alert Ameri business men up and down the m business street which is called Escolta.

Side by side with the Filip carretelo, a little two-wheeled pulled by a small horse, swiftly American-made automobiles. Side side with American horses one see great lumbering carraboa. Side by with a beautiful American girl walk a beautiful brown-skinned pino girl with her great bulging slee

Side by side with Orient walks the C dent for "East is E and West is West never the twain s meet" does not a to these streets wi the Walled City Manila. The w world meets here: S beria, India, J Spain, China, Ja America.

I have traveled world over, searc out the unusual, the untrod trails; s ing to find those co and crevices of the that white men never looked into; I am here to say there is no spot on face of the earth that is so fu beauty, history, architectural gran brooding romance, in such a compass of space as will be found in this single square mile tha surrounded by these ancient and pressive walls of Manila.

This year tourist traffic to Eu is so heavy that the booking panies are swamped with private group tours. I know of one orga tion that has had twenty-five m work for six months mapping private tours of Europe for Ameri It looks as if all America will Europe this summer. Many of Americans have been in Euro dozen times and yet that rom spot, our own possession and our responsibility, out yonder in the P pines is unvisited. Here is a forg and a little-known city-beautiful, has more cathedrals, and more b and wonder than the average t will see in all Europe—and it within the walls of a single city- that *our own*.

Trees showing over walls of Manila.

Upper left—Puerta del Paran entrance.

Center—Pasig River scene in the heart of old Manila

Left—An ancient prison gate in the walls of the city.

Right—On top of the walls of Manila.

Typical thatch roof home in Filipino section of Manila.

Dome and tree beautify the old Manila walls.

EVENTUALLY the people rule. It is always safe to return to that point as a basis. They are ruling now, inasmuch as they permit the kind of rule which exists now. When this kind of rule ceases to be to their taste, they will substitute another. The people are not politicians, they are not even political economists; they are pragmatists—that is, they believe that if a thing works well it cannot be very far wrong. The whole situation which faces the rulers of the world today—the parties, the politicians, the princes—may be stated in four words: *It does not work.* The complaint of the people is never against form or method, but always against failure to function.

Change of Address

1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

Presented in This Issue:

Mr. Ford's Page this week takes up the question of e "old-fashioned" virtues as set forth in copy-book axims. Some of these old maxims seem to have been rgotten. (p. 11)

Few visitors to Paris, especially book-lovers, have iled to remark the open-air stalls along the banks of e Seine, whereon are displayed all sorts of rare and rious wares, but more especially books. There are iles of these book-stalls, and their proprietors are men ch as Dumas or Victor Hugo would have liked to pict. A resident in Paris tells us all about them. (p.2)

Political questions to be of interest or value must ve expert treatment. The Wadsworth-Garrett Amendent is something that is vital in its relation to the onstitution of this untry. Iredell Meares s made an especial study this matter and in terse nguage sums it up. (p. 3)

The newspapers pubh so many conflicting ories about Soviet Rusa that it is worth while ving a survey of the uation there from such able writer as Stanley igh. This eminent auority on Russia and the ast gives us a "close-up" the Russia of today. It impartially written, and formative. (p. 4)

So far as we know, ere has not yet been a rike of college presients; but if hard work to be taken as an excuse r "downing tools" colge presidents should ve been in the liable-torike class long ago. (p. 6)

Harrow is one of the ost famous of the great nglish public schools. It was on the benches of its schoolroom that such men as the poet Byron carved their names as a preliminary to carving a name for themselves in the great world beyond. (p. 12)

Today almost everyone is interested in radio broadcasting. It is well to keep posted on all developments in this direction. This article affords an insight into things not generally known in the radio world. (p. 13)

One of the most romantic of the world's romantic rascals was undoubtedly William Parsons, the son of an English gentleman, who was the pet of a powerful duchess and the despair of his parents. (p. 16)

Thomas Carlyle has been called "The Sage of Chelsea," but he was much more than this; he was one of the world's greatest philosophers and writers of history. In the world of letters he made a world of his own, and his memory today is as much honored in Berlin as it is in Ecclefechan. (p. 18)

We have been so much accustomed to regarding the spider as a nasty, disagreeable pest that it is somewhat startling to find a champion who regards it as a benefactor to mankind. (p. 20)

Where the next national park will be is the theme of an article by Max Bentley. (p. 22)

There is no book ever printed that is so well known as the Bible. Bibles were printed in America at an early period. (p. 28)

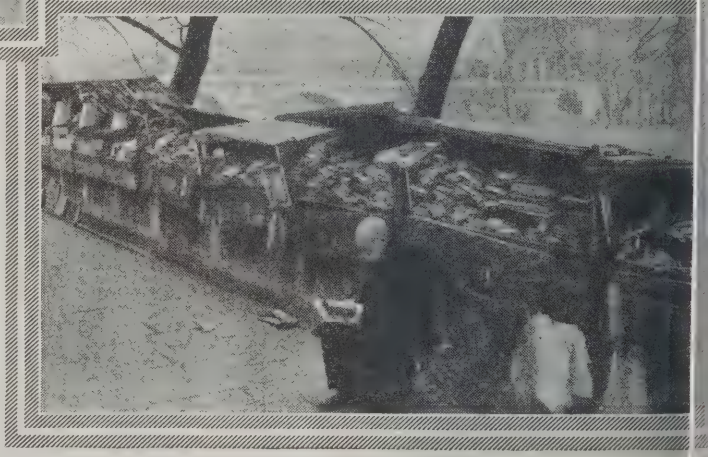
Little Trades of Paris Street

An Out-of-Door Library That Stretches for Miles Along the River Seine

By ANDREE PRATOUCY

TO the majority of Parisians the "quays" do not mean the "*bric-a-brac*, nor the *matelassiere*," nor the dog-clipper; they mean the out-of-door library which, stretching along four miles of parapet, exhibits the queerest displays of books watched over by the queerest librarians. Imagine thousands of steel and wood boxes with half-open covers, and tightly fixed on the stone walls in such a way that their contents may be seen, handled and read with the maximum of facility. You may stand there for hours, going from one box to the other, perusing through remote Hindu philosophers, through all yesterday's and today's literature, and no one will bother you with the usual "What shall I sell you?" You may find treasures in the ten-sous' box, in the "original editions" section, in the moistured, nibbled, leathered books bearing the date of their birth—the "*an de grace*" 1360, 1485, et cetera, under some faded seal. Right opposite the water, the old Louvre seems to protect them from modern plunderers. A special atmosphere softens people and things.



Above—Old booksellers on the Quai de Conti (the right part) Institut de France, Paris. Right—An old-books dealer on the Voltaire Quay, Paris.

And close by, in an old house of the Quai Malaquais, a wide-awake child once reared amid his father's books and permeated with this atmosphere—Anatole France—was later on to pay tribute to his former educators, the quays of the Seine. "I know of no pleasure more peaceful than that of looking for books on the quays. From the dust that covers the content of those humble boxes, you may evoke a thousand terrible or charming ghosts. You converse with the multitude of the dead you meet there. The Elysian Fields, so praised by the Ancients, offered nothing to the wise after death that the Parisian does not find on the quays in this life. If I have ever tasted the sweetness of having been born in the city of generous thoughts, it has been while sauntering from the Palais Bourbon to Notre Dame. All the way you hear the very stones telling of the most beautiful of human adventures—the history of ancient and modern France. It is there that I most keenly feel the labors of generations, the progress of ages, the continuity of a people, the sacredness of the deeds done by our forefathers to whom we owe our liberty and our studious leisure."

The Seine ripples on its waters the reflection of its belt of trees. Twilight. Sunset is but a purple glow behind Notre Dame but the fourteen bridges gradually put on the jewels of their soft green and red lights. A flute modeling a four-notes pastoral and then, from the medieval Rue Saint-Julien-le-Pauvre emerges a flock of goats which seems to be the vanguard of Israel's cattle making for the Red Sea. But the flock stops with the flutist. Women and children—some still out of breath from hurrying down six flights of stairs—gather around with jugs and cups. And amid the rumbling buses, this sets a Virgilian scene; the shepherd milks the goats with as much ease as if he were in a Highland glen, and children drink with delight the overflowing milk foam. Then onward trots the flock, with the warbling flute for band.

The tripe-seller with his horn, the "*remouleur*" (knife-grinder) with his chime, the "*rempailleur*" (chair-mender) with his fife, the chinaware-mender with his clarion are but a part of itinerant morning orchestra w makes it a point to wake up P with music. They seem to spring from the pavement all at once, the street is their own shop where t sell, buy, repair, without minding traffic. Soon a tenor joins them—"*vitrier*" who carries on his back size-cut pieces of glass so that he fix "*a la minute*" any window accidents. Then comes a barit the barrels' buyer with his "*Tonnea Tonneau-o!*" worthy of the op and also the bass—the "*chands' habits*" (clothes' buyer), whose pu of voice could make one believe h just out from a class at the servatory instead of his being bo for the flea-market. But the sta without contest, to be found among "*peaux d'lapins*" (buyers of ra skins). For his song is most o not only a mere mercantile cry also a whole melody going down up the scale with a fantasy which an artist can afford:

Peaux de lievres, peaux de lapin!
Allons Mesdames!
Mesdemoiselles!
Fouillez vos caves,
Fouillez vos greniers,
Voila le peaux d'lapins Bordelais!

(Hares' skins, rabbits' skins!
Well, ladies
and Young Ladies!
Search through the cellar,
Search through the garret,
Here comes the "Bordelais"* rabbi
skins buyer.)

Is it only his skill or the Pa si taste for "civet"—rabbit meat co k with a red wine sauce—which ak the "*peau d'lapins*" so popular A any rate his trade is prosperou a keeps pace with the general fan y felt hats and fur coats. (*Concluded on*

*Bordelais—from Bordeaux.

Shall People or Politicians Rule?

Wadsworth-Garrett Amendment Attempt to Open the Door to Popular Expression

By IREDELL MEARES

THE joint resolution, which would have submitted to the states for ratification what has become known as the Wadsworth-Garrett Amendment to Article V of the Federal Constitution, was lost in the legislative jam at the closing hours of the Sixty-eighth Congress. The article in question declares that amendments "shall be valid to all intents and purposes as a part of this Constitution when ratified by the legislatures of three-fourths of the several states, or by conventions in three-fourths thereof, as the one or the other mode of ratification shall be proposed."

The Constitution was first adopted by the several states through the action of conventions in each state, the delegates to which were elected by the people on the Constitution issue. But the nineteen amendments, subsequently adopted, were submitted by Congress to the legislatures of the several states and ratified, without a reference to the people, by three-fourths of the states acting through their legislatures.

It has been pointed out in previous articles in THE DEARBORN INDEPENDENT that 2,316 members of the legislatures of certain states, which would constitute three-fourths of the legislative membership of the states, could amend the Constitution, as the law now exists, without regard to popular sentiment in their respective states. State legislatures were cited as having done that very thing.

The members of Congress in both House (435) and Senate (96) make a total of 531. Suppose Congress acting unanimously submitted to the states any proposed amendment. The aggregate number of members of all the legislatures of all the states is 7,290. Suppose each of the legislatures of the states, acting separately, unanimously ratified an amendment submitted by Congress. Then, we have the situation that 531 members of the Congress, which submitted it, and 7,290 members of the legislatures, which ratified it, constituting in all 7,821 citizens, can change the Constitution of the United States, without reference to the sentiment or the will of the majority of the 110,000,000 inhabitants and citizens who comprise the nation.

Congress in submitting amendments has uniformly, by a majority vote of its members, declined to adopt the mode of submitting them to the conventions of the people of the several states. One purpose may have been to save the delay and expense of each state having to call a convention. Another purpose may have been to gratify the proponents of amendments who consider it easier to convince legislatures to ratify than to convince the people. A convention would represent the action of the people in that the delegates chosen to attend the convention would be elected upon the question of the proposed amendment.

> Why should "Child Labor" reformers distrust fathers and mothers?
>
> Why do they prefer to do business with politicians rather than with the people?
>
> Why are they fighting now to prevent the people having a word to say about changing the Constitution?
>
> You will see why the professional labor leaders and reformers prefer to appeal to 7,821 state and national legislators, rather than to the 110,000,000 who form the nation.

It appears from official sources that, from the adoption of the Constitution to 1889, there were introduced in Congress 1,736 proposals and since 1889 to the present Congress 1,252 proposals to amend the Constitution, or from its adoption to the close of this Congress as many as 2,988 proposals to amend have been made. Only a few of these were ever acted on by Congress or reached the point of submission to the states.

Senator Wadsworth, of New York, introduced in the Senate, and Representative Garrett, of Tennessee, introduced in the House, at both the Sixty-seventh and Sixty-eighth Congresses, resolutions to submit to the states an amendment to Article V, known as the amending clause of that instrument. This proposed amendment has been discussed in both Senate and House and, if a vote could have been reached, it would have been submitted in all probability to the states for ratification. The Judiciary Committee of both houses made favorable reports, after hearings, but the Senate Judiciary Committee so amended it as to provide for a mandatory referendum in each state instead of a permissive referendum. However, Congress adjourned without acting on the proposed amendment and the matter will probably come up at the next session.

The Wadsworth-Garrett amendment would make four changes in the fifth article of the Constitution. These changes are:

First. It would provide "that the members of at least one House in each of the legislatures which may ratify shall be elected after such amendments have been proposed" by Congress. It would not prohibit its ratification by the legislature of a state, nor make compulsory a referendum, but it would make mandatory that one House of the ratifying legislature must have been elected subsequent to the submission by Congress of the amendment to be acted upon. This would give an opportunity for the people to select the members of at least one house of the legislature with a view to their voting on a Constitutional Amendment. It offers a means for popular expression, though indirect, and would forestall hasty consideration and final action by legislatures whose members were elected prior to the submission of the issue and without popular discussion of it.

This provision, as will be seen by the second, would not prevent a referendum of the people, where it is required or demanded by the laws of any given state.

Second. The second change would provide "that any state may require that ratification by its legislature be subject to confirmation by popular vote." The Ohio constitution has a provision that "the people also reserve to themselves the legislative power of the referendum on the action of the general assembly ratifying any proposed amendment to the Constitution of the United States"; and the constitutions of Tennessee and Florida both require that no legislature can act upon an amendment to the Constitution of the United States except one elected subsequent to the submission of that amendment, thus affording the people of those states an opportunity to choose representatives with reference to their stand on the issue involved. But—and here's the rub!—the states cannot make valid such provisions, as the law now stands, for the Supreme Court of the United States has held that the function of a legislature in passing upon a proposed amendment submitted to it by Congress is a Federal function and, when submitted to it, the legislature is not controlled by either state constitution or statutes. So state laws of referendum or restriction as to Federal amendments are (Concluded on page 15)

Soviet Russia Seen at Close Range

American Globe-Trotter Analyzes the Changes From Czarism to Communism

By STANLEY HIGH

Stanley High, who contributes this article on Moscow under the Soviets, has recently returned from Russia, where he has come directly in contact with the Soviet leaders and become familiar with their policies. He has been an extensive traveler in Russia and Asia, and can speak with authority of their people and their objects. Though not yet thirty, Mr. High has in the past six years made three extensive journeys in Europe, as well as an expedition to Asia. He is the author of *China's Place in the Sun* and *The Revolt of Youth*.

MOSCOW, under the Soviets, is a city of posters. The rulers of Russia, who direct the affairs of their Red realm from the palaces of the Kremlin, are master propagandists, as Communist outbreaks in many places indicate. And every feature of the program which they propose to carry through finds its way, sooner or later, to the billboards of Moscow. I have seen everything on them from the news of a student strike in China to an announcement of a Jackie Coogan movie—though this last, of course, was not "Red" literature.

Last summer, of all the assortment of posters that adorned the city, none was so spectacular as those which announced the opening of the fair at Nishni-Novgorod up in the Volga Valley. Now, the fair at Nishni was a famous and extraordinarily profitable business enterprise of the prewar days of the Czar. For generations, in fact, traders and merchants had come from out of the East to do business over the counters at Nishni. Indians from below the Khyber Pass, Persians from beyond the Caspian Sea, Tartars in strange costumes, and Chinese with stranger goods, all had found a meeting place at this ancient market, where their products could be sold, at shameful prices, to gullible Occidentals or, at prices less shameful, to the representatives of European business houses. The annual business at Nishni—for the few weeks that the fair was open—ran into the millions and as many as a half-million persons have visited the fair during one season.

But Nishni, as with all things capitalistic, was due for the ax when the Communists came to power. Here were acres of buildings, a magnificent monument to that barter and exchange, that reckoning of profit and loss which the exponents of Karl Marx had come to destroy.

With the enthusiasm of the first days of the revolution, therefore, the Communists worked havoc at Nishni. They tore down the buildings for firewood; they destroyed the bargain counters for the pure joy of it; and left the place only when more promising places offered.

Poster circulated by the First Transportation Corporation of Soviet Russia, showing trade-mark. The lower lines in Russian read as follows: "Nijny Novgorod Fair 1924. Through Nijny Novgorod we will make a strong connection with Soviet Russia and the States of the East. Edition advertisement Bureau of the Fair Committee."

But last summer the bulletin boar of Moscow announced the return Nishni. Posters, unrivaled even the United States, besought and i plored the poverty-stricken Russia to patronize the fair—and brilliant colored pictures set forth the beau of the place and of the goods it was contain.

Something, apparently, had ha pened to the Communism of the Co munists. I went to Nishni to find ou

Parenthetically, let me say a wo about that trip to Nishni. It is li most trips in Russia at the prese time, all right if you get the right tra and all wrong if you don't. The trai of Russia—the good ones—are a jo They run on a wider gauge than tho of the United States. In a Russi compartment you can always find ju that additional amount of room y always look for in a Pullman and a never able to find. Some of the oth things you may find I won't menti But of room there is plenty.

There were three other p sons in my compartment. I ne discovered much about the for it was da when we started a the only light ca from a diminut candle, set behin dirty glass up n the ceiling where lighted everythi except the space cupied by the p sengers. Then, th were no sleepi car facilities. the "right" R sian trains, the p ter—who serves everything fr brakeman to d ing-car steward will bring forth, response to a a bundle of beddi clean bedding that, with which makes up a bu But there was such luxury on t train. So I ro in my steamer r tucked my pock book into a c paratively inacc ible spot and sl soundly.

The next mo ing I was in Nish The town is b half on one and half on other side of Volga. On

Wheat in the shock on a "Model Farm" in South Russia.

Twenty-five thousand dollars' worth of American machinery has just been shipped to the Reconstruction farm in the Black Sea region.

tation side of the river the fair and ll its hanger-on establishments, from he Soviet jail to a miniature Coney sland, were located. Across the river—n a series of high bluffs overlooking vast valley that stretched out to a lue horizon—was the city itself, with arrow streets, gold-domed churches nd a great clutter of rattletrap cabs, rawn by dilapidated horses. My uide piloted me across the pontoon ridge into the city for lunch. Food, ven Russian food, and the dust and eat of the fair was an impossible ixture so we found an attractive tea oom overlooking the river and had a eal Russian feast from whatever in ussian goes for "soup to nuts."

But it was about the fair and the ansformed Communism of the Com-unists that I had come to inquire. So s soon as I was off the train at Nishni, rmed with my press passes all signed nd countersigned by the right officials Moscow, I set off to find the "Honor-ble Director." His office was located ff an imposing hallway of the ad-inistration building. I sent in my ard—a made-in-America card, printed English—and awaited developments. hey weren't long in coming. Within wo minutes the lackey came rushing rth, and, following him, the Director imself—all smiles and beard! His elcome tumbled out to my interpreter ho got it all across to me as best he ould.

"We are overcome to have an merican newspaperman with us"—asping my hand. "Consider yourself y personal guest. The freedom of the lace is yours. Over there"—pointing a room opposite his own—"are your uarters for as long as you want to ay. You shall have a guide immedi-ely."

"Thanks," I said, when the ex-tement had died down, "but I came p here to find out what business the ommunists had in business. Perhaps ou can tell me."

"Certainly, certainly"—rubbing his ands—"that will be easy. We had have money. But no one brought s any so long as we refused to do usiness. Communism is very fine, ut money is more necessary right now. hat is why we have invited here all the old traders, and have rebuilt ese buildings, and installed electric lights. We only hope that business will accept this hospitality and return to Russia."

I accepted the explanation and went on a tour of the grounds. The fair was hardly under way, but the crowds jammed the place and overwhelmed those who tried to sell their wares. I was making some headway through the throng when my interpreter sighted something of unusual moment. A dense gathering had assembled around one booth and cut off the passageway beyond it. To me it looked as though a riot was in progress—there was such pushing and shoving. At the outskirts of the crowd I halted. My interpreter, being agile after the

On the poster appeared a number of verses entitled "See, Learn and Build a New Agriculture."

fashion of Russians, fought his way through. Several minutes later he appeared grinning.

"What's the excitement," I inquired, "an execution?"

"No," he said, "an exhibit of two American-made tractors."

Russia, plainly enough, was trying hard to get back into business—Communism or no Communism—and the posters in Moscow and the revived fair at Nishni all pointed to the return of the system that had been outlawed when the Soviets first came to power.

Back in Moscow I went to see L. Krassin, then the commissar for foreign trade—now the Soviet ambassador to France. I told him about those tractors at Nishni.

"Is the government selling them?" I asked.

"No," he said, "we'd like to but we can't afford it. The truth is we haven't the cash. Right now we could use ten thousand of those tractors, but we can't buy them. When we can we will begin to make some progress toward the reorganization of our farming system here."

The fact is, as I discovered at Nishni and confirmed elsewhere, the Soviets have gone into business. They weren't quite willing, then, to give an open invitation to the capitalists to return so they were doing the capitalists' job themselves. Lenin—the genius of the revolution—saw very clearly that business, along the old lines, was needed to restore Russia. He introduced what he called the New Economic Policy. That policy was nothing more nor less than an invitation to the small business men to return to Russia. They did return. They flooded in and took possession of the country's trade and it prospered—for a few months only. Then Lenin died and those who followed him in power weren't sympathetic to his economic ideas. His New Economic Policy was resulting in the creation of a new capitalist class. In the Worker's and Peasant's Republic the only people who had much money, who rode in automobiles and wore fur coats, were neither workers nor peasants but capitalists.

So the New Economic Policy passed with the passing of Lenin. The small business men were taxed out of business. The government took over their shops. Two years ago in Russia about 85 per cent of the retail trade of the country was in the hands of private concerns. Last summer the situation was reversed, so that fully 85 per cent of the retail trade was in the hands either of the government or of government coöperatives.

In Russia, therefore, you ride on a government train and a government street car; use a government phone and burn government electricity. You shop in a government (*Concluded on page 29*)

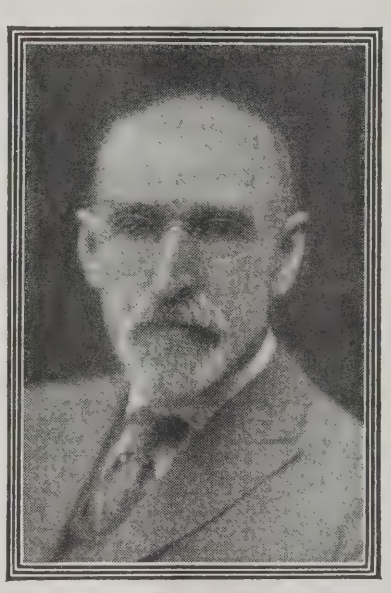
Overworking University Presidents

Few Changes in Managerial Methods Adopted Since 1900; Enrollment Quadruplicated

By FRED L. HOLMES

NEARLY every leading state university in this country is facing the problem of reorganizing its administrative methods on a more businesslike basis. Most of the plans contemplate a divorcing of the dual units of financial and educational supervision now exercised by the presidents.

Although there has been a fourfold attendance expansion in the last quarter of a century, the obsolete ways of administering university affairs are generally retained. Since 1900 the aggregate enrollment in the eight leading state universities has increased from 18,696 to 77,152. Meantime, millions have been expended for buildings; new departments have been added; faculties have multiplied, but the functions performed by the president have gone on increasing. Instead of shifting some of the responsibilities each department has loaded on more burdens. If good results are to be expected, there must come a division of labor. State universities have become great public instruments of influence and power, expanding and developing rapidly, breaking down the old, narrow Latin-quarter college confines and turning the entire state into a campus. And yet, the one-man method of entire supervision still prevails.



President Charles R. Van Hise, of the University of Wisconsin, who was head of the Badger institution for 15 years.

Presumably, the head of a university is interested primarily in the institution as educational. That is still the popular conception of his position. Before the age of electricity and steel, which came upon this country at the end of the last century, his activities were largely educational. Today his duties are primarily administrative and he spends a great deal of his time, most of it in fact, performing services that have little to do with the main thoroughfare of his chartered employment.

Within the last few years the presidential long-hours and all-kinds-of-work situation has been growing more acute. Every university authority with whom I conferred recognized this menacing tendency, but felt impotent to change the trend. Educators began a discussion of its evils with the sudden death in 1918 of Charles R. Van Hise, at the age of 61, as president of the University of Wisconsin. It has been re-presented by the recent death of Marion LeRoy Burton, president of the University of Michigan, at the age of 51. That the deaths of both men were caused by overwork is not denied. That the end for each was undoubtedly hastened by exacting, multifarious duties is generally admitted. Both were victims to a heavy educational harness from which there was no escape from exhausting irksome toil.

It is not my desire to criticize in what I have written. Nor do I wish to faultfind the great state educational institutions which have grown up so splendidly within the past decade. But I know how several university presidents feel about this dual financial and educational collar that hangs so heavily about their necks. Unity of control may have been a perfectly operating system of organization and supervision, when society was less complex, a quarter of a century ago. Unprecedented recent university growth, however, has rendered it cumbersome. Replies to my letters and conferences with presidents and leading faculty members of the several state universities, within the past few months, have furnished an abundance of data, which makes me feel that I shall render a service by calling attention to this problem. Neither legislatures nor the public have sensed its direful aspects.

Dr. Marion LeRoy Burton, late President, University of Michigan.

The problems of state university expansion have come upon the country rather suddenly. Greater economic independence in families of all classes has helped to popularize higher education. As in most situations which develop rapid the method of organization adop has been to patch-on instead of cre ing anew. Of the eight institutions fr which information was gathered, m of them are now striving to simp their schemes of management. So have made a modest attempt to reli the president by creating the office business manager or financial se tary to look after the fiscal det Others have established the posit of assistant president, leaving to president the shaping of the la educational policies. California u versity alone seems to have more ne approximated a solution. There president of the university is not pected to devote any time to secu legislative appropriations, admitted all as one of the most trying du which a state university presi must perform. This responsibility California is handled by a contro backed by enthusiastic alumni.

Such an adjustment of services come only by shaking off traditions facing the new problems with a pres day spirit. Universities have plodding in grooves, occasionally br ing away from their century cust and classical curricula only under urge of some dominant educati leader, like Henry Barnard or Ho Mann. Methods of supervision become antiquated while the sys of presenting popular and prac education has grown more vital year.

State university beginnings back little more than a century, bu collapse of the four-year classical is recent. Early constitutio Vermont, North Carolina, Pennsylvania provided universities; in 1785 University of Georgia organized and the versity of Tenn was founded in 1 Thomas Jefferso came the busy moter of the ide public higher ed tion. While he complished littl his lifetime, the spiration he gav others was abiding opposed the idea t university must b tablished distinctly f education of the clergy asked Virginia to found and secular institution, u ported and controlled the state.

Out in the West the words o far-visioned leader were to be nur to fruition. While these other

educational beginnings were groping for light, the University of Michigan, established in 1817, forged ahead with the ideal and became the recognized "mother of the state university system." Essential differences between a state university and other universities are few. But these few distinctions are characteristic. Most important is that the former is a part of the public school system, with the uplifted standards of the educational ladder resting in the district and city schools for support. Moreover, state universities draw the bulk of their students from the state where they are located. Connecticut could not support Yale nor would the students of New Jersey be sufficient to support Princeton, but the 11,000 students at Michigan and the 9,000 at Ohio State are largely from their home states.

In the growth and development of the state universities there has been a blending of educational ideals. First came the French spirit which prevailed for a quarter of a century and then in about 1830 the German influence swept America, resulting in a coördination of the schools of the West into an elementary, secondary and university system, all under governmental supervision. At first Michigan and Virginia followed closely the German model as to management. The rectoral plan, instead of a president, was utilized for supervision. Michigan discarded this plan in 1851 and the other western state institutions never gave it a trial.

Innovations in education started early in the fifties. These were changes which were to make state universities potential. At first only men students were matriculated. But the competing denominational colleges gradually forced a coeducational program. Oberlin, founded in the backwoods of Ohio in 1833, opened with twenty-nine men and fifteen women, the first coeducational college in the world. Other western sectarian institutions followed. A broader spirit of freedom soon manifested itself. Those state universities which were founded after 1850 were coeducational from the beginning; Iowa admitted women in 1858; Washington in 1862; Kansas in 1866 and Minnesota in 1868. When the classrooms of the University of Wisconsin became depopulated by enlistments during the Civil War, women were admitted and after the conflict the regents were never able to expel them. Within a few years every state university admitted women on the same terms as men.

James B. Angell, for 38 years President of University of Michigan.

Meantime, other forces were operating to diversify educational opportunities. All western states were granted lands for the founding of universities, but the Morrill Land Grant Act of 1862 wrote the most important chapter in the history of American educational development.

It is now estimated that 13,000,000 acres of public domain were distributed and that the success of this stimulating movement has had a beneficent effect in the offerings made in the interests of higher education.

Benjamin Ide Wheeler, who served as President of the University of California for 20 years.

And yet, with all these aids and encouragements, colleges and universities crept up slowly in enrollment. With the liberalizing of the curriculum, however, in the latter part of the last century; with the more general application of the elective study plan; with the development of athletics; with the introduction of new subject courses; with the founding of engineering departments, dairy schools and experimental farms, the attendance tides began to roll higher.

Any one of the state universities of Illinois, California, Minnesota, Nebraska, Iowa, Michigan and Wisconsin, had more students registered this year than all seven had in 1890, when the aggregate enrollment was 7,300. Coincident with the improvement of country-wide home conditions and popular educational advantages the thin lines of students were transformed into increasing phalanxes with each autumn semester.

When universities were small it was impossible for a university president to exert a powerful influence by supervising all details of education and finance. He stamped the institution with his dominant personality. Some of the greatest educators any nation has produced helped to pilot these universities to their present expansion. Great were the services performed by James B. Angell, who in 1909 at the age of 80 retired after 38 years as president of the University of Michigan; of Cyrus Northrup, who retired in 1911 at the age of 76 after 27 years as president of the University of Minnesota; of E. Benjamin Andrews, who retired in 1908 at the age of 64 after 8 years as president of the University of Nebraska, and of Benjamin Ide Wheeler, who retired in 1920 at the age of 65 after 20 years as president of the University of California. That period of individualistic state universities came to an end about 1910 and since then more than one president has been floundering in an effort to perform all of the functions and powers exercised by his predecessors.

To analyze the duties of a state university president of today is to catalog the important activities of the institution. He is striving to perform, singly, services which in a business organization are executed by an entire board of directors; or in the organization of the government of the United States by the Cabinet and the President. Such a personality must be ubiquitous. He must be able to get liberal appropriations from a legislature which is seldom enthusiastic about higher education; he must be tactful in his appeals to the public to sustain the state's interest in his institution; he must be a good public speaker, able to entertain a farmer's picnic or talk with authority at a convention of psychiatrists; he must be willing to waste his time smothering the gossip and bickering that emanate from rival departments; he must give supervision to the minute details of administration, discipline, and other routine affairs; he must act as the arbiter of the salary and rank of those who are employed as members of the faculty and he must be able to judge of the teaching abilities of those employed in the different colleges.

Every new expansion gives him more responsibilities. Of all the duties, great and small, which have come up with the office of president, only one has diminished in the time it requires. Denominational controversies have largely ceased. Once the state universities were characterized as "Godless institutions." With the increased enrollment most denominations have founded churches close to the campus and the old animosity has died down.

Other duties, however, have increased in burden. In a state university, handling a legislature is perhaps the most nerve-racking job of the president. It occupies his time for fully a year in every biennium. He spends six months preparing a budget and six months going over it with the legislature. Too frequently public opinion in the state does not understand the university needs and the appeal to the alumni is not based on knowledge of conditions and the resources of the state, but on a spirit of loyalty to their Alma Mater. He must fight his battles largely alone.

Facing difficult legislative situations the president attempts to educate the public to his program. This sometimes creates factions. Perhaps one

class of persons becomes interested in the building of an educational department, or the erection of a medical school or the founding of some new branch in experimental agricultural research. At the expense of a balanced development the president must see his adjusted program violated and must tactfully allow these factors to triumph in the hope that other enthusiasts in the future will correct the inequalities.

Such practical problems involving his policies may turn a scientist or noted educator into a resourceful politician. Because he is the head of a great public institution, the public claims his time. He must accept all invitations which come his way. He would rather be devoting himself to studying the suggested development of some department, but there is a mothers' convention and he must be there to address them on invitation. His popularity increases with his lack of attention to the practical educational problems that pile higher and higher on his desk.

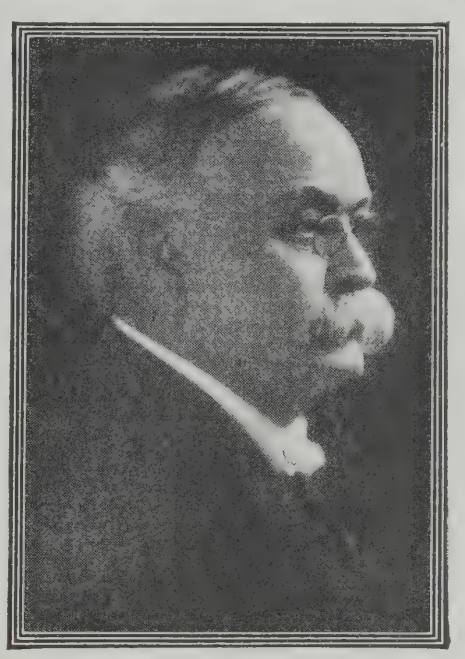
Within the institutions are pressing problems for him. Students create many. There is a rivalry between fraternity members and "barbs" and he must be deferential in dealing with their aspirations. Cliques form within the departments, jealousies arise between colleges—there is evil gossip even in educational circles. Unless checked it ultimately affects the morale of the university and the president must give it attention.

"I am reminded of the story told by President Lincoln," declared Chancellor Samuel Avery, University of Nebraska, in discussing some common duties of presidents. "During the Civil War a delegation came from an Illinois town to interview him in regard to a local postmastership. One of his old friends said: 'Mr. President, how worn you look! The war must be killing you.' Lincoln is reported to have replied: 'The war doesn't worry me at all. It is your postoffice that is killing me.' In a word, any president can be relieved of routine labor. It is difficult to secure relief from considering the constant adjustments that are forced upon his attention."

The social activities are also important. University life is eminently respectable and correct and professors and everybody else dissipate their energies in trying to meet the responsibilities of the social scale. And the president must be the social leader. His office makes him such and there is no escape and few opportunities for alibis.

"Perhaps the most exhausting things about the president's duties are things which are not in one sense his duties at all," declared a leading faculty member of one of the large state institutions. "I refer to the many calls upon him to go out of town to attend meetings and to give speeches. Also the numerous demands upon his time, even when he is at home, to attend dinners, committee meetings and purely social affairs. Of course, some of this is unavoidable. A president must be known to his clientele, whether this be the alumni body or the people of the state which supports his university. It is especially true that in the case of a state university president the state will conceive that it has a presumptive right to see and hear the state university president at local gatherings over the length and breadth of the state.

"It cannot but be wearing to frequent Pullman cars and banquet tables, with the additional nerve strain of speaking. The presidents also have to do a great many things on behalf of the university because there is no one else to do them. The lack of definition of the president's duties is one of the reasons why he may easily be overworked."



Cyrus Northrup.

To a surprising degree the presidents of universities tie themselves up with minute details of administration, discipline and other routine affairs. Too often the president desires to keep his finger on every activity. There is need in connection with the office of president of a reference or research bureau that will gather the experience from other universities and will actually study the educational and administrative procedure of the university itself and will bring to the president any new policy that may be developed.

There are two functions of a president that seem primary. They should rank above all others in importance. The selection of strong, able men to serve on the faculty is first and the supervision of them is second. Both duties give a president endless difficulties. One faculty member watches, not the work of the other, but the salary roll. A difference, between men of the same age and general training, but with relatively different temperaments as teachers, over $200 salary a year, may disrupt a department. The president must be watchful and tactful.

University professors are trained in subject matter. Many of them find greater interest in expounding dry facts than they do in enthusing the human element to activity. The result is that men who should settle the little problems which come before them pass them on. Every educational leader with whom I conferred over this presidential overwork problem pointed to the job as one in which everyone shifted responsibility. The president of one of the largest universities stated it as tersely as any.

"The university presidents of this country are willing to work and to work most industriously," declared this university president. "I think they take pleasure in their work. Furthermore, I am convinced that the amount of work which they do would not be regarded as a burden were it not for another fact or set of facts. One who is at all familiar with the situation in America, relative to the heavy burden which university presidents are expected to carry, is well aware of the fact that many of them are not standing up under the strain. The strain, however, is not due primarily to the number of hours they devote to their work, not to the multiplicity of duties they have to discharge but to something else.

"It is due in the first place to the failure or the unwillingness of other administrative officers within the institutions to accept responsibility, and in a second place, to the American theory of the right of appeal. A vast majority of the questions and problems which should be settled by the deans and other officers of the university are passed on by them to the president for disposition. This puts the deans in the innocuous position of being able to say to the members of his staff: 'We recommended this matter to the president,' or 'We submitted this matter to the president' or 'We passed it on to him—the responsibility of disposing of it, therefore, is not ours.' This unwillingness to accept responsibility is the first great weakness in university circles and a primary source of worry to university presidents.

"Failure to accept the responsibility which goes with the office is accompanied by another. This is the desire on the part of those who are affected in case the dean or other administrative officer acts, to appeal their case. The result is, that the presidents of universities, instead of having a large part of their time free for the consideration of problems relating to educational affairs and policies, are compelled to spend a considerable share of their time adjudicating difficulties and disposing of questions and problems which should never be presented to them.

EDITORIALS

Give Me Liberty or Give Me Speech

SPEECH is saved for the next generation. One million four hundred thousand high school students entered the recent national oratorical contest, and a boy from Alabama won. Which is fitting, because American ideas shot forth by southern oratory shaped the nation's beginnings, and influenced it at every crisis. Someone with far foresight, knowing that we were coming into a time of ignorance, ignorance of the ideal foundations on which our national liberties are built, conceived the plan of entering high school students the nation over in a platform contest whose subject should be The Constitution. To have 1,400,000 young men and women studying that Document and the times and convictions which brought it forth is an educational program beside which some so-called "cultural" stuff falls far into the shade. This nation will be a nation as long as it knows wherein its nationhood rests. Two things preserved this knowledge: instruction as to the historical facts and their present relations, and invasions of the liberty won for and bequeathed to us by men who did not live to enjoy its fruits. In these days we have both: we have the invasion of liberty under guise of constitutional changes; and we have instruction as illustrated in these contests and their wide public appeal.

What Is a Hero?

WEBSTER defines a hero as "a person of distinguished valor or fortitude." But a man may be a pirate, a smuggler or a highwayman and still be brave enough. One is struck by the widely divergent angles at which historical personages are viewed. The Scots regarded Wallace as a national hero, but the English king looked upon him as a rebel and marauder and had him hanged, drawn and quartered. Sir Francis Drake was acclaimed as a hero by the people of England, but the Spaniards regarded him as a common pirate.

John Paul Jones, the founder of the United States Navy and its first admiral, is honored in this country, but in an article in one of the Scottish newspapers he has been summed up as a "traitor-adventurer who not only pillaged the shipping of his own country (Scotland), but fought under the flag of any other nation that promised to pay for his services."

But a Glasgow man tersely retorts: "Paul Jones was only a 'rebel' like George Washington, holding a commission from the same body to fight the tyranny of George III."

Heroes do not always possess the god-like qualities attributed to them by the ancient Greeks and those who have succeeded them. But to become a hero, a man must have evoked the gratitude and admiration of someone. Hero worship is among the most ancient of the cults that survive today.

Benevolent, Though Cannibals

HERODOTUS, the father of history, speaks of a tribe in the Far East that used to eat its aged and sick people. By doing so the members of the tribe provided themselves with a cheap meal, avoided doctor's bills, and saved funeral expenses. They also derived satisfaction from thinking that they had put their friends out of their misery, and hastened their arrival to the tribal Elysium.

In *The Golden Bough* there are instances given which show that among certain primitive peoples, the practice of disposing of one's relatives in this manner has not entirely died out.

An example of it was recently brought to light in the discovery of a tribe in the interior of Africa which has connected with it a secret society that cooks and eats objectionable people "for the public good."

It appears that these cannibals are sincere in their idea of service and "safety first," and think that they are practicing much fortitude and self-denial in thus making things easier for the rest of the tribe. They are said to be an intelligent people, well up in the arts and handicrafts, and insist on a rigid initiation ceremony before new members are admitted to their society.

It is not so much an act in itself as the intention which guides it that counts. Judged by this standard who shall condemn the poor heathens?

Pandora's Hope Chest

THAT old story about Pandora's box has as much interest today as it had in the mythical days of ancient Greece. Hope was one of the virtues which Pandora did not allow to escape from her precious casket, and Hope has remained in the world ever since.

Today the world is more hopeful than ever, and despite the many depressing and disturbing influences at work there is no general tendency to sink under these or let them become predominant.

The world is neither all good, nor is it all bad, and this has been the way of the world

since its beginning; but for the first time in history there exists a movement for its betterment in which almost every tribe and nation is endeavoring to participate.

Nevertheless the destructive forces which permeate the world today cannot be ignored. One might as well ignore a festering sore which increases in virulence the more it is hidden and neglected. The subversive influences which are at work must be followed and checked. If there is a world-wide and conscientious effort to do this, good must follow.

Unfortunately, while this is the age of a universal tendency toward better things, it is also the age of quackery. There exists an army of doctrinaires who are continually shouting their formulas from the housetops and are mightily offended if the multitude does now swallow them and ask for more. There are busybodies who beat the air and plow the sand, but who never do anything that is constructive or worth while.

The world today wants men of action, not talkers. It wants leaders, not shouters. Above all it wants to retain that spirit of confidence and hope without which all things would end.

What Disraeli Said About the Semites

THE gift of prophecy has from time immemorial been associated with the Jewish race. Forty-five years ago one of them foretold that within a quarter of a century the Jews would emerge from the obscurity in which they had been enveloped for centuries, and take their place in the sun.

That man was Benjamin Disraeli, writer, politician, and favorite of Queen Victoria, who conferred upon him the title of Lord Beaconsfield. As a novelist Disraeli was by no means brilliant, but he occasionally said remarkable things. In his "Endymion," written in the year 1880, occurs a striking reference to the coming influence of the Jews in higher politics. In chapter LVI in that book is the following:

> "There is another great race which influences the world, the Semites. Certainly, when I was at the Congress of Vienna, I did not believe that the Arabs were more likely to become a conquering race again than the Tartars, and yet it is a question at this moment whether Mehemet Ali, at their head, may not found a new empire in the Mediterranean. The Semites are unquestionably a great race, for among the few things in this world which appear to be certain, nothing is more sure than that they invented our alphabet.
>
> "But the Semites now exercise a vast influence over affairs by their smallest though most peculiar family, the Jews. There is no race gifted with so much tenacity, and such skill in organization. These qualities have given them an unprecedented hold over property and illimitable credit.
>
> "As you advance in life, and get experience in affairs, the Jews will cross you everywhere. They have long been stealing into our secret diplomacy, which they have almost appropriated; in another quarter of a century they will claim their share of open government."

Disraeli was a greater prophet than he knew, but were he still living he would not have to refer to the Semitic influence in governmental affairs in terms of the future, but in those of the present. Their "unprecedented hold over property and illimitable credit" are universally acknowledged, and "secret diplomacy" is their long suit. Today this chapter of "Endymion" would require considerable revision to bring it abreast of the times.

What Fools These Mortals Be!

PUCK was right, for few of the highest type of the animal creation, even among the wisest, have closed their careers without a display of folly. Old Ben Franklin wrote his own biography, narrating in its pages what he termed his follies, without realizing that to tell intimate incidents is folly in itself. Yet Franklin was a sage and philosopher.

Recently a public speaker asserted that no scholar should be graduated until he knew the Federal Constitution by rote.

Knowledge without understanding is of little value, and a parrot may be taught to repeat the wisdom of the sages; but if a candidate for political honors were to rest his laurels entirely on his ability to repeat either *Roberts' Rules of Order* or *Cushing's Manual*, his reputation as a parliamentarian would suffer. Moreover, a knowledge of the history of the framing of the Constitution and its interpretation in the courts is as essential to understanding as the language of the document. The student must pass an examination in Civil Government before graduation. His own language in that test is the best criterion of his understanding.

Bores

WEBSTER defines a bore as "a person or thing that wearies by prolixity, dullness, and so on," and the act of boring as "to weary by tedious iteration, or by forcing one's presence upon another." It seems to us that this definition is altogether inadequate. There are many other things characteristic of bores that the lexicographer has missed, notably their entire inability to mind their own business.

But the bore is something more than an inveterate nuisance; he is a robber as well. He not only squanders his own time, but he deprives you of yours.

MR. FORD'S PAGE

A PUBLIC speaker recently deplored the decline of "the old-fashioned virtues of honesty, justice, and decency." These old-fashioned virtues, so-called, were included in what is now called "copy-book maxims." At one time precepts such as these formed a regular part of the school course. Not only in the copy books but in the reading and other textbooks "gems of wisdom and pearls of thought" formed a part of the curriculum. Why is it not so now? Have we grown wiser in our generation than "the children of light"?

One of those maxims told that "Procrastination is the thief of time." The habit of "putting off" has ever been one of the greatest drawbacks to service of all kinds. It is one of the greatest obstacles to progress today. Many a good resolution has been rendered useless through delay in carrying it out. To do the right thing at the right time seems with some people almost an impossibility.

Promptitude invariably adds to the value of any good action, and, inversely, delay often lessens it. Some of the greatest reforms have been held up through the procrastination of politicians. It is one of the main causes of the lack of efficiency in governmental affairs and of immense loss to the nation.

Another of those copy-book maxims was that "Evil communications corrupt good manners." Evil communications are more prevalent today than ever they were in the world's history, for the simple reason that the means of propagating them are more powerful. The invention of printing was a boon to humanity, but the presses had not been long in operation till they were put to uses which were altogether foreign to their original purpose. There are many thousands of books today which should never have been printed.

But it is not alone the printed word that is responsible for the large amount of "evil communications" that is prevalent today. There is the misuse of the motion picture film and the theater. There are others which are not so easy to detect. There is that underground current which is so hard to check but which is so destructive in its effects; that passing from mouth to mouth of the verbal garbage which seems to be so much relished. Among young people this taste is particularly keen, and a great amount of harm can be traced to this source. It seems a great pity that cleanness of thought and speech are not more in favor with the present generation.

Another copy-book maxim which has been largely pushed aside by the trend of modern thought is that which teaches that "Honesty is the best policy." Perhaps there is no precept in all the category of "old-fashioned" philosophy that is more indifferently treated. It is considered by many to be a smart thing to be crooked. Some people are called "soft" because they are honest.

What, after all, is honesty? Honesty is truth, and truth is justice, and justice is doing to others as you would be done by. So there are many things contained in that one word "honesty." Honesty is the difference between that which is real and that which is false, that which is sound and that which is rotten.

THERE was once a time when men took pride in their handwriting. They also took pride in what they wrote and how they wrote it. The old-time copy books were models of neatness in their penmanship and of sound common sense in the maxims they set forth. These maxims were based on the experience of ages and on the best ethical standards. Having to be repeatedly written they were indelibly impressed on the minds of the pupils. It would be an advantage these days if some of those "old-fashioned precepts" were revived.

There is much talk of corruption, but no one suggests a remedy. People have accepted it as a necessary evil. But no evil can be called necessary. A fungus which retards the growth of a tree is not regarded as a necessary evil. Steps are taken to eradicate the fungus so that the tree may not be blighted, and if it cannot be eradicated by any other means the tree is cut down and destroyed, to prevent the fungus from throwing out fresh spores and infecting other trees.

When fungus attacks a political office or government department, it is too often the custom to hide it, not to remove the cause by laying the ax to the root.

Why is it that when administrative corruption is found there is usually an army of apologists? When an orchard is attacked by any pest we do not find any eagerness on the part of the neighbors to have it retained. Why then should there be so much anxiety to cover up evils that are much wider spread?

Some cynic has said that "there can be no such thing as honesty in politics." As well say that there can be no honesty in anything. Without honesty the whole fabric of Government becomes fly-blown and moth-eaten. "Safety First" is an excellent message, but a still better one is "Honesty First."

"The old-fashioned virtues of honesty, justice and decency" are flouted because it does not suit someone to put them in operation. You will be told that those copy-book maxims are now hopelessly out of date. Nothing that is good can ever become out of date, but evil is out of date all the time.

This country would be all the better for having a mammoth edition of these old copy books reprinted and circulated all over the continent. They should be read and digested by politicians and public servants of all kinds. They are not for one class or section. They are for all. Pity it is that the old-time writing master with his old-time precepts has been largely cast aside.

The Fourth Form Room, Harrow (from "Greater London," Cassell and Co.).

Harrow-on-the-Hill

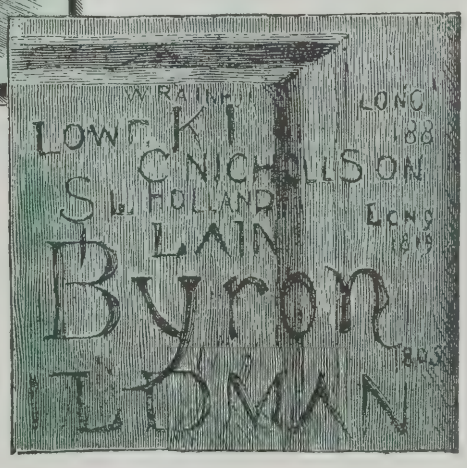
The School Where Byron, the "Melancholy, Most Unpopular Boy," Carved His Name

By HUGH A. STUDDERT KENNEDY

IT WAS King Charles II who remarked dryly to some divines who were disputing with him about the *visible church* that he "knew not where it was to be found, except indeed, at Harrow-on-the-Hill." Visitors to the British Empire Exhibition, opened recently at Wembley Park outside London, will understand just exactly what the Merry Monarch meant. There is no getting away from the spire of Harrow Church. It has a way of being suddenly discovered on the horizon at the most unexpected points, many miles distant, and it is of course the great landmark in the broad vale of Harrow, in the midst of which is Wembley Park.

In many ways it is a curious spire. The men of Harrow-on-the-Hill, from the first, realized that if they could build here a spire of any height no traveler by the road to London, in the valley below, could ever pass them by unnoticed. But the foundation is not good on the top of Harrow hill, and so the first builders, men of the days of King John and Anselm, ventured to carry the tower no higher than the roof of the old church. Three hundred years later, however, the church was largely rebuilt, and then the height of the tower was raised. But the foundations failed under the added weight, and so the huge clasping buttresses, so notable a feature today, were built to support it. Finally, undeterred by previous experience, some fifty years later, the present tapering spire was added.

That was about 1450. And so, for nearly five hundred years, the "isolated spire of Harrow church" has been one of the great landmarks of the countryside. "It may be noted," writes one chronicler of the days of the great Eliza, "how nature hath exalted that high *Harrow-on-the-Hill*, as it were in the way of ostentation to shew itselfe to all the passengers to and from London, who beholding the same may saye it is the centre (as it were) of the pure vale; for Harrow standeth invironed with a great contrye of moste pure grounds, from the hill towards the time of the harveste, a man may beholde the feyldes rounde about, so sweetly to address themselves to the sicle and syth, with such comfortable haboundance of all kinde of grayne, that it maketh the inhabitants to clappe theyre handes for joye to see theyr valleys so to laugh and singe."



Byron's name, from Fourth Form Room.

But if Harrow can be seen from everywhere, everywhere can can be seen from Harrow. From the top of the tower beneath the spire, so it is said, one may, on a clear day, see no less than thirteen counties. Be this as it may, whether from the top of the tower or from the old churchyard below one may see a great distance on all hands. It was here that Byron when a schoolboy at Harrow used to come of a summer evening, and lying at full length on an old tombstone, still pointed out as "Byron's tomb," watch the sun go down in a red glory over the Chiltern Hills.

Again I behold where for hours I have
ponder'd,
As reclining at eve on yon tombstone
I lay;
Or round the steep brow of the church
yard I wander'd
To catch the last gleam of the sun's
setting ray.

So he wrote years afterward when the "melancholy, most unpopular boy" was forgotten in the great poet.

There are many other tributes throughout its long story to this city set upon a hill for its "splendid elevation," but certainly none more practical than that which was paid by one William Bolton, sometime Prior of St. Bartholomew's, Smithfield, and later, rector of Harrow-on-the-Hill. It was in the latter part of the year 1523 that the worthy prior became convinced that London certainly, if not the world generally, was to be destroyed by a great flood. And so, as one account has it, he erected, at very great expense, a sort of fortress at Harrow-on-the-Hill, which he stocked with provisions for two months. On January 24, 1524, a week before the awful day which was to see the destruction of London, he removed thither, with the brethren and officers of the priory and all his household. A number of boats were conveyed in wagons to the fortress "furnished abundantly with rowers, in case the flood, reaching so high as Harrow, should force them to go fur-

Broadcasting or Outcasting?

Why Not Radio to Delight This Generation With Music Masterpieces of the Past?

By A. R. PINCI

NO LARGE daily newspaper in this country is now complete unless it publishes the radio programs of the day, local and distant, with some accompanying text; some dailies endeavor to review the broadcasting of the preceding twenty-four hours, while others seek to interpret the immediate schedule. Certain newspapers try to keep their programs correct as to hour, performer and topic, not an easy feat, considering that sometimes half a thousand items are involved. The railroad time-table, once the most complicated specimen of composition involving numerals and wording, has been outdistanced by the radio table. Lately the more prominent dailies have begun editing programs, so as not to advertise unnecessarily certain publicity seekers, a rule that has not been copied as widely as it merits, because it aims at justice for bona fide advertisers and protection for individuals or institutions truly in the public eye. Too much dubious "talent" has found its way to broadcasting chambers, generally unsolicited but often welcomed because it is difficult to gather together a tabloid variety of features, which will constitute a well-balanced bill of three to ten hours' duration, six times a week, fifty-two weeks a year, Sundays and holidays calling for half-rations.

Needless to say, there is not that much genuine talent available, even in the United States; but assuming its availability, what of duplication? Is it reasonable to think that the average listener expects to go through life with such ear-splitting output as the sole object?

In seeking an answer to some of these questions, I have made it a point to investigate this phase of radio, a phase suggested both by a prominent manufacturing corporation and a reader of THE DEARBORN INDEPENDENT, because I had not touched upon it when two articles on radio appeared in these columns last autumn.

Before me is today's issue of a well-known New York newspaper that swirled its editorial thumbs, so to speak, while some of its metropolitan competitors had special radio promotion departments and special sections devoted to its reading matter. It carries 44 inches of solid program matter; 616 agate lines, approximately, actually worth $400. This is not an illustration but a fact because this newspaper publishes radio programs in full while announcing with regret, elsewhere, the "unavoidable omission of" many columns of advertising for lack of space. That figure means $100,000 a year which the publishers contribute to radio.

On this day sixty-five stations are listed, seven in New York City and five in the environs, their operating schedule being from 6:45 a. m. to 2 a. m. of the next day. Allowing for a silent period between the "daily dozen" service and the earliest morning regular broadcasting, there are sixteen hours of output. Is all this output worth while? Is it essential? Is it constructive? Is it beneficial? Is it a boon?

> Radio has not scratched possibilities in unearthing little-known but beautiful music. Radio is at its best with music and not with speechmaking. There are dozens of tunes in operas which delighted our grandparents. Why not broadcast some of this music? There are thousands of folk songs that have thrilled American tourists in the native regions of those songs. Also, what happened to some of the exquisite chamber music that flourished about the same time as the operas?

Disregarding high-power stations within the 500-mile radius which radio engineers and devotees consider "local," is the average of the combined service a fair measure of the public's requirements?

Not at all.

The best answer is that it has become a veritable task to select an hour of listening-in that will insure pleasing results. I refer, of course, to an actual program, not to an hour of toying, experimenting, distance-chasing, aimless logging, dial calibrating and what not.

Even this huge city is beginning to realize its twelve stations (with others promised!) are too many. It is not easy to decide which of the two contending sides wins—that which rails at interference or that which bemoans duplication. Nor does it get anywhere to claim that our broadcasting "brings the metropolis home to the rest of the country," because our programs are equaled and often bettered by other cities and towns.

Private companies and individuals have "taken the air" to combine advertising with entertainment and have erected their own plants and studios for this purpose, but in general these stations are in the air only a brief spell. Whether they transmit their own advertising, no matter how indirect, or some other special feature, they are not a problem—at least, not yet.

The big kick is due with regard to those stations which have assumed that the great American public has nothing to do except listen in; and to please everybody keep Mike busy from about noon until about midnight. It's a wonder that some sign off an hour. What is the result?

The biggest crazy-quilt of audition that the patient human ear should be made to hear. Except for the oases constituted by famous bands and noted orchestras, national rites and public functions, the rest is a jumble of "features" lasting from five to twenty minutes, interspersed with an excess of explanatory matter from the announcer. It is true that only a small proportion of listeners-in is fully conversant with the features described; but the average fan has no interest in this unsolicited teaching, and the majority of those interested in any program will learn the details of what it means on their own account.

Busy as the average American is, and quick to go through the business of living, he or she has not yet reached the point where either education or entertainment is absorbed on the five-minute installment plan. The ten-minute standee lunch at the drug store or the one-arm parlor is not a fair indication, because only one such eating period occurs every twenty-four hours, but the originators of the present-style radio programs multiply it indefinitely many hours every day.

"Short and sweet" is a good motto, if brevity were really accompanied by worth-whileness. But one may suspect that rather than be silent between good features the program directors like to fill in with anything.

Broadcasting directors are stumped; they admit it. But to solve their problem they go the wrong way about it; instead of simplifying, they try to piece together a whole mass of heterogeneous matter.

As I said in a previous article, radio was really a boon because it was to keep at home many boys and youths after a hegira of moviedom and night-loafing, a fact that endeared radio to many elders, although the latter still refused to take it seriously. Now these folks have begun to take up radio on its merits, partly due to the first results of the home workshop and partly due to the attractive factory sets being sold, but alas! the effects of fishing a station out of the air dissipate ere the novelty is forgotten.

With the beginning of the year famous artists were scheduled to broadcast under the auspices of two

large companies. At first it was said regularly, which later was set at every second Thursday. The promise was encouraging. But shortly afterward schedules began to crumble. For one reason or another by the beginning of March the famous artists and orchestras consisted of individuals and organizations that did not belong to the "red-seal" class. Let's get this clear. Some of these artists belong in the red-seal class just as some in the red-seal class ought to be sealed out, but we must bear in mind the promise of the two companies and the incomplete fulfillment of the same.

To make advertising practical, a phonograph company planned a contest, with a prize to the listener who sent in the most complete correct list of the names of artists and selections—a "musical memory" contest that is novel and interesting but nevertheless far removed from the true objective of radio broadcasting.

Why Not the Grand Old Operas?

Radio has far from scratched possibilities in unearthing little known but beautiful music—and there is no denying that radio is at its best with music and not with speechmaking. There are dozens of marvelous tunes in operas which our grandparents greatly admired. Why not broadcast some of them? There are thousands of folk songs that travelers and tourists become enthusiastic over when these songs are heard in their native habitats. Many of these exist, forlorn and forsaken, in the catalogs of a famous phonograph company that for some reason has never attempted to popularize them, despite its huge annual advertising budget.

Why regale listeners-in with the millionth repetition of arias from Pagliacci, Faust, Carmen, and the like? In the hurdy-gurdy's heyday it was impossible not to have one's ears pierced by the notes of the Miserere, which was loud enough to be a march instead, but the opera that contains it has seldom figured in our programs.

Is it impossible to treat listeners-in to something outside of the "Rosary," "Ave Maria," "Serenade," "Goodbye," and others in the same category? What happened to some of the exquisite chamber music that flourished about the same time—or even before that?

The Folk Song Is Always Popular

Once in a while we get "foreign features." The most popular just now are Scotch because it enables some announcers to quip about a "little Scotch, not the kind you are thinking about." But be this Italian, Norwegian, Spanish, Mexican, the same old dozen pieces are repeated. Nations and peoples that turned out music for generations are represented on radio, whether educationally or entertainingly, by a job lot of melodies that intimacy has made a little unfriendly.

The plea that the people haven't the patience to listen to "new" stuff or programs with which they are unfamiliar does not hold water. I shall cite an example. Seven or eight years ago, looking for novelties among phonograph catalogs, I picked up Ei Uchnam, which I had heard in Russia. It is now a most popular piece in every movie house and an inevitable accompaniment, better known as the "Volga Boat Song." When I bought the record I had never heard it played in this country in private or in public. The popularity of that folk song (Russia alone ought to yield untold treasures of this kind, the sole heritage from a broken nation) could be multiplied hundreds and thousands of times in the years to come if broadcasting directors and artists get together.

Occasionally we have heard some old-fashioned darky songs, but too often they are massacred by self-styled "coon singers." Has the fertile field of southern plantation melodies been exploited at all? I doubt it. What of our American Indian music? Has any attempt been made to put it on a proper broadcasting basis?

The general feeling has been that this is a jazz age, whatever that may be, and broadcasting directors have felt it their duty to jazz up their programs. But the jazz devotee is not a real radio devotee. The jazz lover is a nocturnal being, a gay wanderer, a lover of the lights and tomfoolery, which are props that the ear cannot convey. While a certain portion of jazz belongs in a program—since those who do not want it can tune it out—it is not the fundamental object or requirement. A parlor dance at home with two or three couples flitting to the radio tune is jazzing that has few disciples, for nothing is more tragi-comic than to watch such a scene and the antics of those who imagine they are whooping it up, with plain lemonade in the fancy cut-glass pitcher nearby.

An Occasion When Jazz Came First

A year ago a poll of listeners was made, in New York City, and jazz came first, classical music being second. It was not an infallible index, but as near as it represented conditions, it was something to go by. But what today? The latest poll shows almost a landslide for serious music. The criticisms of radio reviewers—those who sooner or later must take their place with book and dramatic reviewers—regret the mediocrity of output. Here's hoping they won't go in for blurbs and blah!

There is a story current, which may or may not be true, of a radio fan who so disliked a certain station's program that he made bold to call on an executive of a concern which owned an important studio. The executive listened patiently.

"We aim to please," he said when the fan had finished with his complaint. "We do not want one unsatisfied customer. Of course, we cannot refun you the money for the set, but we sha gladly refund to you every dollar yo contributed to broadcasting."

Whereupon the kicker was abashe and walked out without another wor

A great deal has been said about th chances taken by purchasers of radi sets, since there is no way of guarante ing for themselves any sort of a pr gram for any time or any period. Suc as it is, broadcasting is a plain gif although some call it an outrig charity. In this the radio owner unlike the purchaser (himself include of other mechanical commodities. T cost of the instrument or machine but the first step. There is a fami that years ago bought a phonogra for $300 and has since accumulated library of 4,000 records, which mu have cost at least $3,000, and additio and replacements make this a continu source of expens

Programs Which Might Well Be Cut

Sooner or lat radio will readju itself so that nominal fee may exacted for broadcasting (the bo legger and contrabandist will never eliminated, whether it be radio anything else) but certainly such step will never follow so long as t present situation continues. W wants to contribute to such lopsid broadcasting? And a prediction virtually in order: unless wirel radio sets its house in order n wired radio will cut in soon and v favor among that class that has t right to want what it wants when wants it. It is all very well to depe on the individual broadcasters, th that take the air as an advertiseme or for promotion work, or out of c pride, but why depend upon such bou when radio can be made supreme on own account in its own right? The worthy broadcaster will always be w come; but the broadcasters t started the craze and have achieve national necessity owe the public so thing better than they are getting.

And the sooner some stations cur their programs, and go in for silent d and nights, the better it will be.

Too much of a good thing is a bad thing—and maybe that's why it is not so good these days.

There are a great many people w can find no medium between j music and classical music. But thi a mistaken idea. Before jazz made its appearance, before there was suc a word as jazz in the English langua e, there was what was known as "popular music." This popular music was not elaborate compositions by the great composers, but haunting melodies of joy or sorrow, heard in castle and cottage alike. The songs heard at the fireside, crooned by mothers as they rocked the cradle, shouted to the skies by men as they marched into battle, sung by the sailors on their lonely watches, and echoed in all parts of the earth where the soul of music lived

Shall People or Politicians Rule?

(*Continued from page 3*)

nugatory and the legislature can ignore them and its action is valid. This proposed change, not mandatory but permissive, leaves each state free to provide for a referendum, or for the election of the ratifying legislature subsequent to submission, or, after ratification by the legislature, for a referendum to approve or disapprove the ratification, as each state may prefer and provide by its laws.

Third. It would provide "that until three-fourths of the states have ratified or more than one-fourth have rejected or defeated a proposed amendment any state may change its vote." At present, when three-fourths of the states have ratified a proposed amendment, it becomes incorporated in the Constitution as a part of it; but, as provided in this change, any state may withdraw its ratification before three-fourths have acted for ratification. Having ratified, its function determines and its control is ended. It has always been interpreted that rejection, as the matter was submitted for ratification, does not end the control of the legislature, but it might first reject and afterward ratify. In fact, the states might not act at all, but the question would remain open, and would await the ratification of three-fourths of the states. In the proposed change, a state which may have ratified can change its vote or withdraw its ratification at any time before the three-fourths have ratified, but, after that, it cannot change its vote from ratification to rejection, as the amendment would have been adopted; and, when more than one-fourth of the states have rejected any proposal of amendment, which is a sufficient number to reject, no state can thereafter change its vote from rejection to ratification, as the amendment would have been defeated; but this would not prevent Congress by subsequent resolution to resubmit it, with or without modifications.

Fourth. It is intended, as stated by Mr. Garrett, "by the use of the words 'or more than one-fourth of the states have rejected or defeated' to bring the matter to an end so far as the states are concerned, and make it necessary that any amendment so rejected by more than one-fourth shall be again submitted before further action can be had." As at present, when more than one-fourth of the states reject any proposed amendment, it is defeated in that the requisite three-fourths of the states cannot be had to ratify, so in the change suggested, when more than one-fourth have rejected, it will then be necessary to have the question resubmitted by Congress.

Opposition in the last days of Congress developed to the Wadsworth-Garrett proposal, not so much in Congress as on the outside. Certain women voters and welfare worker associations, who seem to feel more assured in getting through amendments by favorable action of state legislatures rather than by the vote of the people in the states, and certain labor organizations, registered the opposition of their officers, presuming to speak for their members, in a letter addressed to Representatives in Congress and by a small printed folder which declared that "it would make future amendment of the Federal Constitution more difficult, as so stated by Senator Wadsworth." More difficult for whom? Certainly not for the people, for they are now not considered at all! More difficult for the professional lobbyists, perhaps, who have brought the art of handling legislatures to a high degree of perfection.

The opposition further opposes the bill on these grounds:

1. "Offering a bait as a so-called referendum measure, it would not, in fact, require a referendum at all." True; it leaves each state to say whether it will have a referendum or not. It is permissive, not mandatory. But as the law now is the legislature is not bound by any referendum which it might order or which might be provided by state statute, because, as stated, the Supreme Court of the United States has held that all such state laws are nugatory. The proposed change grants the right which certain states have already claimed and been deprived of.

2. "The House joint resolution would permit any state to require confirmation of a constitutional amendment by popular vote. It would not permit a referendum on rejection." This is illogical. However, there probably would be no objection to letting the paragraph read that, "any state may require that ratification or *rejection* by its legislature be subject to confirmation by popular vote."

3. "A small minority of the states, namely thirteen, would be given the veto power over all the states. This minority would prevent consideration by the other states." Every state as freely as at present can consider any amendment submitted and ratify or reject it. It provides, as now, that when three-fourths of the states have ratified, the amendment would be adopted, and, further, if more than one-fourth reject, which would prevent three-fourths being obtained, the amendment would be rejected; thereafter, it would have to be resubmitted by Congress. At present, twenty-eight states have rejected the Child Labor amendment. It is defeated. And yet other states are going on ratifying or rejecting, according to the action of their legislatures, and the proponents of the measure declare they will carry on the fight to induce subsequent legislatures of the rejecting states to withdraw their rejection and ratify the measure. They do not accept a definite action as definite. They say in effect that they will have what they want regardless of official action. Even if the Wadsworth-Garrett amendment were adopted, it would not apply to the present situation of the pending so-called Child Labor amendment.

4. "The chance of any ratification of any amendment would be practically *nil;* in fact, 9 to 1 instead of the present 3 to 1." That is, under the present plan of (*Concluded on page 27*)

ARTICLE V OF THE CONSTITUTION AS IT NOW STANDS:

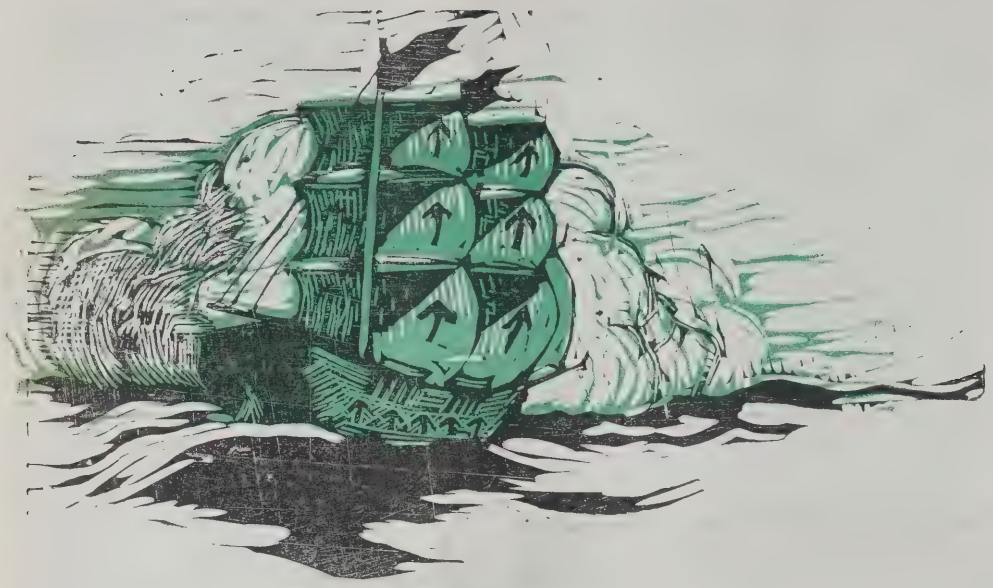
ARTICLE V

The Congress, whenever two-thirds of both Houses shall deem it necessary, shall propose amendments to this Constitution, or, on the application of the legislatures of two-thirds of the several States, shall call a convention for proposing amendments, which in either case shall be valid to all intents and purposes as part of this Constitution when ratified by the legislatures of three-fourths of the several States or by conventions in three-fourths thereof, as the one or the other mode of ratification may be proposed by the Congress: *Provided*, That no amendment which may be made prior to the year 1808 shall in any manner affect the first and fourth clauses in the ninth section of the first article, and that no State, without its consent, shall be deprived of its equal suffrage in the Senate.

THE PROPOSED WADSWORTH-GARRETT AMENDMENT:

ARTICLE IV

The Congress, whenever two-thirds of each House shall deem it necessary, shall propose amendments to this Constitution, or, on the application of the legislatures of two-thirds of the several States, shall call a convention for proposing amendments, which in either case shall be valid to all intents and purposes as part of this Constitution when ratified by three-fourths of the several States through their legislatures or conventions as the one or the other mode of ratification may be proposed by the Congress or the convention: *Provided*, That the members of at least one house in each of the legislatures which may ratify shall be elected after such amendments have been proposed; that any State may require that ratification by its legislature be subject to confirmation by popular vote; and that until three-fourths of the States have ratified or more than one-fourth of the States have rejected or defeated a proposed amendment any State may change its vote: *And provided further*, That no State, without its consent, shall be deprived of its equal suffrage in the Senate.



Romantic Rascals—No. 4

William Parsons, Esquire

By CHARLES J. FINGER
Author of "Highwaymen," "In Lawless Lands," "Bushrangers," "Tales From Silver Lands," etc.

Wood blocks cut by Paul Honoré
(Copyright, 1925, by Charles J. Finger)

WHEN young Parsons, Eton scholar, played Montem alone, he set up a course of trouble for himself and everyone about him. For Montem, a custom abolished these seventy years and more, was peculiar to Eton College, and this was the way of it. Every third year, on Whit-Tuesday, certain selected students used to go to a mound near the Bath road, and, until noon, every passer-by was held up, as we would say, giving what he could spare, and the amount collected was handed to the senior scholar to help defray his university expense. It was a kind of comic opera highway robbery, and, doubtless, those accosted were willing, went to the place prepared to give, and, the business being over, felt themselves supremely blessed.

Now Parsons, the son of William Parsons, baronet, and the pet and favorite of the Duchess of Northumberland, had no right at all to play Montem. The truth is, he was a harum-scarum youngster, and having lost money by betting on the great prize fight between James Figg and the Venetian Gondolier, he went out to the mound one night, a lad of fourteen or so and tall for his years, and there, armed with a pistol and disguised by a mask, he called on a timid horseman to stand and deliver, and robbed him of all that he carried. Naturally there was an outcry and a pursuit as soon as the robbed man told his tale at the inn, and, the ground being soft after a rain, the tracks were followed so that the pursuers came to Eton school. The chase might have been abandoned even then, for that an Eton scholar should play highwayman was unthinkable, but, hearing the noise, young Parsons fired his pistol from a dormitory window and the bullet took the constable in the arm. That led to closer investigation and much questioning, not only of Parsons but of his schoolfellows, and soon it became known that for some time past things belonging to the scholars as well as to the provost and the chaplains, had disappeared. A general and thorough search being made, much treasure was discovered in Parsons' box, not only money, but rings, and chains, and watches, and snuffboxes, nor to them could the lad lay any well-founded demand, while, on the other hand, there were earnest claimants. Indeed, Parsons seemed to have only the slightest knowledge of what was there, and with all the wealth it struck everyone as being odd that he should have turned himself into a highwayman to reimburse himself for his losses on the prize fight.

In those days there was a hearty belief in character rather than in the mere knowledge of facts, and in discipline of self in preference to discipline by definite rules, nor were men given to lay much stress on the psychological effects of corporal punishment. So the young Etonian was soundly birched, then expelled, and his father, Sir William, received a warm letter from the provost in which that staunch disciplinarian said that while he "would not declaim against occasional rough ways and outbreaks of savagery in un-matriculated novices, anti-social and dishonest dealings were not to be overlooked, the more because the ideal of the school was to train youths to take their places in society as gentlemen." He further prophesied that certain courses, if pursued, might lead to unpleasant ends, and added that if the lad was to become a man true and efficient and worthy, he should court sincerity and simplicity. There followed a long Latin quotation which voiced the provost's fear that young Master Parsons displayed few of the sterling qualities of his ancestors and was inclined to follow courses not closely connected with true happiness.

After that, young Master Parsons ran at large awhile with nothing much to do save to taste the froth and ripple of life, but he had no liking for simplicity. One day it came to the ears of the Duchess that the lad on whom she had set her hopes had been seen at Vauxhall, gaming and drinking, so she sought her friend, Dean Swift, whose new book "Gulliver's Travels," was the talk of the town.

"Madam," said the satirist, speaking very loudly and distinctly, "the young wretch persists in keeping company that is absolutely and irreclaimably vile. He runs to the Yahoos as water runs down hill. Your kindness to him is cruelty, the kindness of his father is folly. Into the army or the navy with him, and the speedier the better. Foreign service, madam, foreign service."

"But the dear lad among a lot of blackamoors," said the lady, dismayed.

"He might learn decent behavior among Hounynnhums easier than among those with whom he associates," growled the Irishman.

All that the rough dean said was so true, and the fact of young Parsons' worthlessness so very apparent, that the upshot of the matter was that the youth was put to naval service as midshipman on a vessel bound for Jamaica, for there were family connections with influence.

But no sooner did the lad find himself in uniform, with money in his pocket, than he was off in the novel character of naval hero to try his fortune in his own way. So one day William Parsons entered into the town of Bishop's Waltham, riding in a coach with four horses, displaying everywhere letters from the Duchess, getting easy credit because of his appearance and family, and making himself popular with the local gentry by his dashing ways and his singing of rollicking nautical ballads. A very charming young man he seemed to be, and, if some looked upon him as the scion of a noble house sowing his wild oats, it did not prevent the beautiful Miss Burke, daughter of a physician, from taking a romantic interest in him.

For seven days all went well, safely and smoothly; then, at a little part of an unsentimental, hard-headed Scot made some inquiry as to the young midshipman's leave of absence, and hard on that, an old lady who knew the Duchess put a few searching questions, whereupon Master Parsons collapsed like a pricked bladder. The rest was

easily done. For Sir William soon heard the tale, posted down from London, laughed at his son's awkward attempt at playing Don Juan, then marched him off to Sheerness where the ship lay, delivered him into the hands of his superior officers to receive what punishment he seemed to merit for his desertion, and saw him taken by the scruff of the neck and led away by a grim giant of a Yorkshireman.

The ship sailed soon after, and, on the way to Jamaica, William was eager to explain matters and to tell why this thing and that had happened, asserting his high-mindedness and his well-meant aspirations and intentions. It was true, he said, that he had tried to marry, but that was actuated by patriotic motives and he wished to found a family in America for the greater glory of England, and all that kind of thing. But his superior officer had been trained in the School of Captain Walton* the man of brevity, and knew nothing but discipline and directness. With him it was a word and a blow for the idle, and a rope's end for the shirker, so William Parsons was driven to abject expedients to ameliorate his lot.

Nor were matters easier when Jamaica was reached. Shore leave the lad had none, but, instead, many duties, the captain holding that activity was good for the moral health. To be sure, for young Parsons there was the responsibility of authority, but the pride of dominance was not in him. So one night, when a ship bound for England anchored in the bay, the heir presumptive to the Duchess of Northumberland's fortune climbed aboard as stowaway, hid himself among the sugar barrels, and, in due course of time, turned up in London.

Then there was the work of melting the hearts of his father and the Duchess by tales of hardship encountered and perils met. There was a pathetically sentimental story of his narrow escape from death in the hurricane that swept the island, when, as he said, houses flew through the air like leaves from the trees, and the face of the water was lifted like a sheet. There was a moving relation of his intrepidity in fighting revolted Negroes in the fastnesses of Blue Mountain Peak. To cap all, he gave a wonderful account of the way in which he saved a superior officer from the jaws of a shark. He wound up with a very beautiful lofty and tender speech in which he said that henceforth he would guard the quality of his life, looking well to it that his happiness should not depend upon excitement and stimulus. And when he ended by saying that it grieved him deeply to be separated from his kinfolk and to be severed from his native land, his hearers relented. The long and short of it was that the young man was taken into favor again and established in a well-appointed apartment in Regent street, at which he expressed great joy, confessing that his heart had always yearned for understanding and affection.

For almost a year things went without friction, Mr. Parsons being perfectly complacent and contented as long as he was well supplied with money, but there came a time when empty hours remained to be filled. The passing of an act of Parliament for the building of a bridge across the Thames by the sale of lottery tickets was as a providence for the young man with nothing to do. Into speculation he plunged boldly, ascribing the failure of others of his acquaintance to do likewise to civic cowardice, and so thoroughly did he engage in high finance, that one morning he found himself behind the bars in the Fleet prison with many other insolvent debtors. His last half-guinea went to pay the tipstaff for a bowl of punch, and, for a time, he endured days of drudgery while strong allies in his family did what could be done to have the scapegrace reinstated in his country's navy. That at last being done, he was shipped off on board the *Rodney*, and for some years experienced the physical realities of the world and the homely business of life off the shores of Newfoundland.

But the obscurity of a life on foreign service annoyed him; to plan and intrigue was a passion with him. One day he decided to break the bonds that enmeshed him, and decision came with a rush when he learned that the Duchess had willed her fortune to his brother, then in India. So he lost no time in getting to London on a homebound whaler, and at once assumed his brother's name and, by an impudent fraud, came within an ace of laying his hands on property to which he had no shadow of claim. That piece of insolence was almost too much and there was a vision of prison walls which awoke a sort of hysteria in the family. But Sir William, after many denunciations and censures, bethought him of his lineage and all that the disgrace of imprisonment might mean. So there was a hasty canvassing of friends wealthy and titled and powerful, and at the end, William was (*Continued on page 25*)

He called on a timid horseman to stand and deliver.

*The Captain Walton who, in the action off Cape Passaro, in 1718, wrote to his admiral thus:

"Sir: We have taken or destroyed all the Spanish ships upon this coast, the number as per margin.

Yours truly,
G. Walton."

The Making of Thomas Carlyle

What Made Him a Great Philosopher? Was It His Early Life Story?

By GAIUS GLENN ATKINS

Illustrations by J. A. Nielson

IT is nearly 90 years now since Thomas Carlyle read the proof of his History of the French Revolution and spoke in a strong, unrestrained way of printers, proofs, probable critics and the weather. It is "really," he said, "like a man dighting [sifting] chaffy corn in a barn for the whole blessed day." The whole of the wordy business about Carlyle which has been going on for 40 years now is in that quotation. No man ever raised more dust in "dighting" his corn than Thomas Carlyle, and few men for a hundred years have brought in a better grain when you can get at it.

The trouble has been to get the wheat clear of the chaff. Thomas found it tryingly hard work—witness pretty much everything he said or wrote about himself—and his friends added to the general smother. His wife had a sharp tongue, a tireless pen and a proper and boundless interest in her husband. She married him for love and a canny Scotch confidence that he was her best bid for station and fame, and "dighted" her full share of chaffy corn during courtship and marriage. Mrs. Carlyle wrote letters enough about herself and her husband to keep the heirs of the Carlyle manuscripts in royalties for a long generation, and Carlyle if anything went her one better. Give him paper and, I suppose, a goose quill, a "frank"—which is early nineteenth century for free postage—silence and solitude and he will write you three printed pages and call it a note. He loves to date his letters "late at night, in the middle of a sleeping household and of silent moors"; after that everything is grist that comes to his mill.

There are now seventeen volumes of Carlyle correspondence—all hand written. Some of it is Emerson and some Goethe, but the solid substance of it is Thomas and Jane. Love letters which should have been burned, and letters of protest and explanation which should have been burned twice, and letters to free their souls which should, having served that necessary purpose, have been posted in the waste basket—and letters nineteenth century literature would be poor without.

Everybody who knew the Carlyles apparently kept a diary and wrote it up after every visit. Charles Eliot Norton, that flawless mirror of the great, wrote his reminiscences, and J. A. Froude, by no means a flawless mirror, wrote his reminiscences, and Carlyle, not to be out-done, wrote his own wherein he repented at length and often of all his sins of omission and commission, being an entirely honest soul and, for good measure, repented of sins he had never committed at all.

Thomas Carlyle and his mother.

Between them all they filled the air with the chaff of the Carlyle drawing room and the Carlyle study, the Carlyle bed and board and the inwardness of the Carlyle soul. A man who created and held and still holds so general and absorbing an interest is a great man—and, to be quite honest, no small amount of the interest was and is in the dust raised. A serene sage of Chelsea, with a good digestion, a growing family, a wife who always said "Yes, Thomas," and two thousand typewritten words a day and no fuss about it, would not be the Carlyle his friends and disciples find so irritatingly interesting. No man ever made discontent so fascinating or protest so absorbing. He invests the taking of Castor Oil with an epic quality, and if he goes out into his garden of a summer night with his pipe, to compose his soul under the stars, his meditations there have a kind of skyey splendor and his sentences sing the music of the spheres.

Whether a man be fortunate in personal oblivion if only his work endure is a matter to be debated. We know little enough of Shakespeare save that he had an unlawful liking for other men's deer and such small gossip but it makes no difference with his fame, though we should be glad enough to know how he felt when he wrote "Hamlet" and "The Tempest." St. Luke and Homer are probably the better off because they have left us nothing but the third gospel and the Iliad. But I am not so sure of Carlyle. If we know nothing about him save that "Sartor Resartus," which is doubtful Latin for "The Tailor Patched Up," an impossible book with an impossible name and a quenchless flame of genius was his spiritual autobiography along with a doubtful tradition that his wife once threw a tea cup at him, I wonder if he would last so well.

He was, to use one of his own figures, a nebulous sort of man with a gleam of fire mist all about him and from time to time some delivery of a planet or star from the hot heart of him. No one else has ever so shown the whole process in such fullness of inner and outer action as Carlyle, and those who care for him at all will always want the whole Carlyle, dust chaff and good grain. He is more than a writer of strange genius, and a historian of peculiar power, and a man who saw deep into his time and far down the future; he was Thomas Carlyle, a strange mixture of Isaiah Jeremiah and a Scotch peasant—moral and intellectual volcano erupting across pretty nearly the whole nineteenth century.

For a long generation now the English-speaking world has seen Carlyle largely through the eyes of Froude. Carlyle made Froude his literary executor and put his private papers and his future reputation without reservation in the hands of a man who

could tell a wrong story in a more fascinating way than any historian of his time. Froude, to whom Mrs. Carlyle probably talked too much and to whom Carlyle had talked endlessly, knew intimately the gusty atmosphere of the Carlyle home but missed, curiously, the warmth of affection which bound Thomas and Jane together. He felt the fire of genius which burned at No. 5 Cheyne Row, Chelsea, but he could not feel how warm and tender its hearthstone fire was, nor how Carlyle and his wife lived in the glow of it. Besides, he had no sense of humor, and without a sense of humor you can never see the Carlyles in a proper proportion. Froude will be longest remembered for two things, one of which he meant to do and could not do, the other which he did without meaning to do it: the first was to redeem the reputation of Henry VIII, the second was to cloud the reputation of Thomas Carlyle.

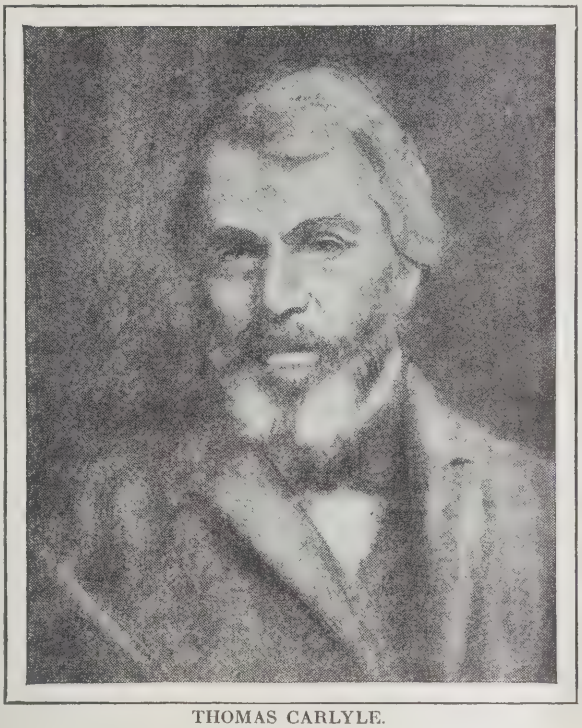
Alexander Carlyle—a nephew—did his best to undo Froude's work, mostly letting the Carlyles speak for themselves with judicious editing. He has published altogether seven volumes of letters and memorials, which is certainly giving his uncle and aunt a fair posthumous chance to be heard. Sir James Crichton Browne entered for the defense, and Charles Eliot Norton. But Carlyle has remained in eclipse.

Largely, I suspect, because the moment and interest of the years have run by him. For a good while now you have had only to call anything Victorian to condemn it hopelessly, and Thomas Carlyle was early, mid and late Victorian. He and his friends sat in the seats of the mighty for a long time, now their successors want a chance. The best any man can do—save the few who are sure of a timeless sovereignty—is to make his own contribution to the current of thought and action and, after a little, be lost in the flow of it. Carlyle taught that himself with great heat; he ought not to complain if he is an example of it.

Exit Thomas Carlyle.

But he refused to stay off the stage. He has begun to enter anew into men's minds as they take account of the progress of Democracy and industrialism and other things; one finds a growing and very respectful reference to him in contemporary English writing. He seems, after all, to have been a prophet, having anticipated with a clear, sad vision the outcome of the tumultuous and apparently triumphant forces which his own time created and released. He would be, if he were to come back again, in the irritatingly secure position of being able to say, "I told you so." It is hard to get away from a man like that.

So David Alec Wilson, who tells us that he had been getting his material together for 30 years, has chosen a strategic time to write a new Life of Thomas Carlyle, two volumes of which—there are to be four altogether—are now published: "Carlyle Till Marriage" and "Carlyle to 'The French Revolution.'" (E. P. Dutton & Co.) He is only half through but I venture to believe his biography will be the standard authority on Carlyle for the future and that the more important part of his work is done. I venture to believe, also, that the interest in Carlyle which will thus be renewed, along with the force and integrity of Carlyle's own writings, will set him again upon a seat of authority from which he will not hereafter be dethroned. He will rule over a diminished realm, but his right to a real empire over the minds of men will grow more strong with the years, for Carlyle also belongs to the timeless fellowship. Wilson's work shows us the making of Thomas Carlyle, for when the two volumes now in print are finished Carlyle is a made man and the rest is detail.



THOMAS CARLYLE.

What made him? To begin with, a deep rooting in an old and sturdy stock. He had a spreading family tree, this son of the village mason. Go far enough back and he had Margaret Bruce, the sister of Robert Bruce of Bannockburn, for a many times removed grandmother. But lands and titles were both lost generations before Thomas was born in 1795 and he inherited nothing save genius, the homespun qualities of small farmers who had lived close to the soil, the sensitive soul of his mother Margaret Aitken, the pugnacious temper of his father James, who had in his early days as much joy in a good fight as a well laid wall—and an accent he never lost.

Robbie Burns inspected the Ecclefechan distillery the year Carlyle was born and according to his own confession drank more of its product than was good for him. Carlyle was born to the music of Burns' lilting song "A man's a man for a' that," and drew in the passion and persuasion of it with his mother's milk. He had no use ever for the unfair advantage rank or station give a man and one root of his bitter protest against the respectability which rides in a gig and gets nowhere and lordship which rides in a coach to its own undoing over the lives of common folk is to be found in the proud independence of the stock which begat him and the militant democracy of the village in which he spent his boyhood.

His forbears had always been border folk and they must have done their share of cattle running; indeed he had an ancestor hanged in front of his own door on a false accusation of cattle stealing. There would be a restless stirring in him as of inherited adventure and a practical shrewdness as well. He managed money wisely, lived inside his income, whatever it was, educated a brother, helped his father and mother, gave his share of the little family estate to his brothers and sisters, and smoked his clay pipe beside his mother's hearthstone, she being likewise happily engaged, in filial loyalty to his race, his kin and his station by birth when he was famous in two continents.

The second thing which made Carlyle was finding a wife. Most men do this without making of it an event in nineteenth century literature; when the time, the place and the girl are happily coincident they get married and call it a day's work. Not so Thomas. He made one or two false starts and, being always thrifty, capitalized one of them in Blumine in "Sartor Resartus," doubtless magnifying therein, as he generally did, his actual suffering and disappointment. Jane Welsh had an ambitious mother, a reputation as an heiress which the family estate did not bear out, a sharp tongue, a keen mind, fine eyes, a capricious mouth, a romantic disposition steeped in Byron, and a high opinion of herself.

Carlyle met her in 1821 through Edward Irving who had been her tutor. Irving was a figure for any 17-year-old girl to fall in love with and Jane fancied herself to have done it. Perhaps she did, perhaps she liked to remind Thomas in later years that there were others; at any rate Froude and Jane between them make a deal of the Irving episode. Jane Welsh kept Thomas Carlyle dancing at the end of her string for five years. Mrs. Welsh took the part of the hard-hearted parent finely. There are rivals and alarms and

Our Friends the Spiders

Some Very Good Reasons Why We Should Not "Kill the Nasty Things"

By S. F. AARON
Illustrations by the Author

KILL the nasty thing! Ugh! It was crawling on me and might have bitten me!"

Heard commonly anywhere and during any summer season such a remark tests credulity and prejudice and what are the usual responses? Or perhaps it is another and supposedly intellectual exposition of the subject that more fitly demands agreement or dissent.

"Now, Professor, what good is a spider?"

"Well, ah—you see, ah—it has no economic importance, but taken in the —ah—general scheme, you see—"

"Yes, I know; all created things they say are . . . but I guess spiders don't count—they are too insignificant."

How long must the observer and nature student labor to combat the silly ideas that have come out of obscure traditions and continue like many another ignorant notion? And must these long remain so persistent that even many persons devoted to the advance of science still cater to popular impressions?

It has been less than half a century since house flies were considered healthful scavengers. There is an old saw:

"With many a fly
Fewer die."

And within a generation ago the mosquito, the bubonic flea, the cattle tick have, with the fly, been branded as deadlier enemies than rattlesnakes. Are we, with the love of nature paramount, not as ready to discover among lowly things our friends as well as enemies?

From the bulletins of the Government Agricultural Department, as the result of work by paid economic experts to which there are none superior, we read, in composite, as a burden of proof: "This bird (or batrachian or reptile) is worthy of protection, for the contents of so many hundred stomachs consisted almost wholly of injurious insects and spiders." And the same frequently occurs in the agricultural reports of the states. Jenny Wren, for instance, is especially mentioned as deserving of praise because of her, at times, almost entirely arachnid bill-of-fare.

Well, let us not quarrel with our friends the birds because they enjoy a fat spider, but rather should we deplore the ignorance of our own species, with a too ready heel and that too common hatred of what merely seems ugly. Not so much because we refuse to accede to Cowper's dictum regarding the listing of our friends, but for purely economical reasons, associated perforce with those of natural interest for delightfully entertaining creatures.

When Mother Nature staged her one grand drama, the Struggle for Existence, she billed the lowly spider as by no means least in the combined cast. But she could hardly have looked with favor upon one of the chief later actors when he turned critic and persistently misunderstood the rôle of these stars. The birds, the bats, the shrews and the moles, the skunk, the frogs, the toads and the snakes all labored long upon the economic scheme of things without due credit and now, most of all, man misinterprets and maligns the spiders.

People have been laughed at for saying that all created things have their uses, even noxious insects and weeds. Their reasons for saying so have not always been plain, and it is therefore refreshing to find a champion of that much abused insect, the spider who gives very good reasons why the spider should be regarded as a friend. The majority of people have hitherto regarded spiders as fit only to weave webs and to annoy one by their poisonous bites.

The student cannot fail to appreciate the spider's part from its dramatic elements. As determined engineers and bridge builders midst great dangers, stringing cables that in proportion would be unsupported for more than two miles; as weavers of gossamer scenes for the enactment of worthy tragedies and then as heroic tragedians killing and being killed; as examples of mother love and industry and finally as practicing economies that influence the very existence of man and beast Madam Spider cannot fail, in the final analysis, to shove aside prejudices and contempt.

If we are truthfully to estimate the virtues of our wild friends let us add a proper element of intelligent wonder to it and cease to determine blindly. Come into the alfalfa field, the clover, the growing grass of any kind that nurtures the farmer's stock and is essential in the production of milk, meat, and fertilizer. Here is the locust grasshopper whose numbers, were they not lessened by enemies, would cut the crop to nothing. Here is the tiny green and banded leaf hopper in vast hordes that make of it an army of destruction even greater than the locusts. Here is the fat green caterpillar of the very common sulphur yellow butterfly; if it were eliminated the crop yield would more than double up. And here also is Madam Spider, several kinds of her and a vast multiplication individually so that every square foot or less is represented by her activities which consist of a desire to obtain insect food whereby she may gain secretions of silk and nourish the hundreds of eggs that each of her species will lay. As against these destroyers of vegetation she maintains the most effective balance.

It is not necessary to look far nor long to discover spiders, which are always among the commonest creatures everywhere. And always about a third of those to be seen are in possession of a victim of some kind. One has a grip with its mandibles on the soft body of a green butterfly caterpillar, the juices thereof composing more than the bulk of the spider. Another has a grasshopper, perhaps nicely snared in a web and trussed up while still kicking, or perhaps the victim has been taken in open struggle. So much for thus policing the hayfield and a much or more may be said of the garden and orchard and something also of arachnid protection of every crop.

The long-horned and handsome tussock moth caterpillar, the cankerworm, the tent caterpillar and, most important, the autumn webworm which also has an early summer brood, are all attacked and killed by various spiders, the most bloodthirsty among which are the black and the gray jumpers and the brown gray and blackish ground spiders with nearly unmarked hairy bodies and long, powerful legs. These build no webs as snares but depend upon catlike propensities in taking their prey.

But the snare weavers, the earliest engineers of many wonderful constructions, whether

flat orbs across wide open spaces, mass webs of irregular design that make a veritable jungle of crisscross cables, or funnel-shaped and saucer-like sticky floors with retreats far down into the grass or rock crannies, must not be overlooked with respect to their services to mankind; services not done *for* our interests, but quite as effectively to our interests nevertheless.

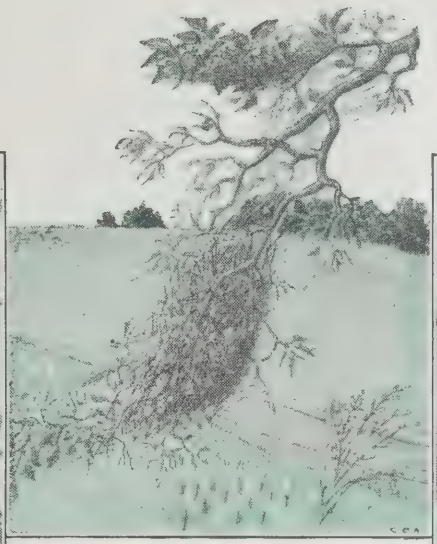
Count the insects in a spider's snare, count the number of snares in a restricted area and sum up. Thirty-three geometric orbs graced the vine-

Doing mankind a favor. The green caterpillar of the common yellow clover butterfly being attacked and killed by a jumping spider.

clad fences of our garden recently and there was an average of more than forty-five insects in each web. One contained sixty-one gnats, many of which were the Hessian fly, enemy of wheat, one large short-horned grasshopper, one small long-horned grasshopper, five blue-bottle meat flies and one cattle fly. Other webs showed as large a percentage of injurious insects; about one hundred per cent. A few webs contained some beneficial species, parasitic wasps, carnivorous beetles and bugs, small field-roving dragon-flies and golden-eyed flies. Among the long grass and at the bases of the fences, in rock piles and hedges there was even a greater number of funnel webs and mass webs, each probably taking as large a toll of victims, though this is impossible to tell, for these snarers drag the entangled insect instantly into their retreats, or else cut them loose to fall from the web as soon as they are bled dry.

But it is to the jumpers and runners among spiders that mankind owes the deepest gratitude. There is a slogan—oft proudly urged by the writer—that if it were not for the birds we would starve to death. With treble certainty this may be said of the spiders.

Certain web-building insects are in respect to wide and threatening injury the worst enemies of man and beast. These are caterpillars, the early stages of common and apparently insignificant moths. They are general feeders; few are the vegetable species that they do not favor. Commonest and most important among them is the before-mentioned autumn webworm, the moth of which is a pretty little white miller, some varieties having black spots and blotches on the downy wings. The worm is yellowish gray with numerous specks and rather long black hairs



Ugly webs of the autumn webworm. A wild black cherry tree nearly defoliated by the late broods of the caterpillars and webs of the young and adult worms on an apple bough.

distributed in small bunches over its entire body.

Few of these webworms survive through the winter; they are not killed by the cold, for normal insects merely have their vitality suspended by freezing, but are killed by their enemies, chief among which are certain spiders. The early summer colony webs of the worm are small and of little importance; they are dense enough to exclude most birds and the worms are distasteful to all but vireos, orioles and the cuckoos, but these are never in sufficient numbers to keep them down. Spiders at this season are immature, as are most parasitic insects also. Each resultant moth of the surviving spring worms lays its quota of about two hundred eggs and the autumn brood, from which the species very naturally takes its common name, is legion.

Every cherry, apple, pear, quince, mulberry, elm, maple, walnut, butternut, hickory, chestnut, sweet gum or sour gum, osage, hawthorn, magnolia, linden, buckeye, locust, persimmon, sassafras, Carolina poplar, willow, and even ash and sycamore tree is apt to maintain and display the ugly colony webs of the autumn webworm. If these caterpillars are at all limited in any section with respect to the number of trees those first mentioned above are attacked by preference somewhat in the order given. But if a colony of these caterpillars is caged and offered any old thing in the vegetable line the worms will readily take it rather than starve, which is commonly exceptional among caterpillars having a certain species of leaf, or genus thereof, as a food plant. This clearly indicates what would occur if the webworms increased beyond the yield of their favorite foliage.

And we also have the wild cherry webworm, the willow webworm, the tent caterpillar common on fruit trees, the walnut webworm, and several others confined to their certain food, but also readily attacking others when their chosen kinds are denied them.

What would occur if these several

A struggle between a friend and an enemy. The big brown ground spider, though kicked in the face, will probably succeed in killing the grasshopper.

species had no natural check? Within the limits of their appetites every green and growing thing would disappear from the earth and it is not the birds, toads, lizards or bats that do most to keep these caterpillars down.

It is only necessary to examine roughly some of these later webs and those of allied species to determine clearly their natural check. Web after web will be found nearly or quite depopulated of the constructive inhabitants, but with each will be discovered the wolves in the fold—commonly three or four species of non-web-making spiders that nevertheless possess the hereditary knack of negotiating webs. And everywhere, all through the mass, are the sucked-out bodies, both fresh and dried, of the caterpillars, victims of the spiders, some of which are often found at their bloody feasts, or in the act of killing.

Even after the autumn broods of these several species of worms leave the web and crawl about seeking places to build their cocoons numbers of them become victims to spiders. At this late season the birds are surfeited with better food, but the little, eight-legged balancers of nature are ever on the job.

No one can blame the housewife for brushing down the dust-catching webs of household spiders from the room corners of her domicile, but other than that let there be, with growing appreciation, a common protection of these best friends of mankind.

Heritage of Mountain and Canon

Will the Guadalupe Region of New Mexico Be Our Next National Park?

By MAX BENTLEY

IT almost goes without saying that some day, perhaps a near day, the Guadalupe region of New Mexico and Texas will be set aside as a national park. When that day comes there will be presented to the American people a heritage of mountains, cañons, valleys, forests and running streams whose beauty is not surpassed anywhere on this broad continent.

There are many excellent reasons why the Guadalupes should be made a park reserve, but it will suffice to set down these four:

The government already owns the New Mexico section. It would be a simple matter, on making a start in the Guadalupes, to reach out northwestward and bring into the park reserve all of the 1,500,000 acres covered by the Lincoln National Forest, in the Sacramento, White, Capitan and Gallinas ranges. The 30,000-acre strip extending into Texas can be bought cheaply.

The governors of New Mexico and Texas, with the highway commissions of both states and the Texas State Parks Board, met recently in a chamber of the Carlsbad Cavern, 750 feet beneath the earth, to pledge their efforts toward the creation of a park.

The Carlsbad Cavern, many times grander than the Mammoth Cave of Kentucky, lies at the southern end of the Guadalupe range.

The whole region is accessible from any direction and in a few hours' motor ride of four transcontinental railway systems. Paved highways are already in use from the northwest and northeast; and recently New Mexico and Texas officially designated as state highways the route from the south, the Bankhead Highway at Van Horn, Texas, to the Ozark Trails at Carlsbad, New Mexico, thence to the Cavern and winding a mile high around a southern break-off of the mountains: a beautiful, breath-taking, but perfectly logical route.

It should be unnecessary to add this fifth reason, that we must set aside more and greater park areas. Census statisticians forecast a population of 200,000,000 before the twentieth century ends.

I have just completed a tour into the Guadalupes, by motor and horse, and afoot. My companion was Judge J. C. Hunter, of Culberson County, Texas. Judge Hunter is mentioned because he has done more than any other man, or any group of men, to lift the Guadalupes from obscurity to public attention. It was Hunter who arranged the official meeting in the Cavern; who personally escorted the governors and their party of 176 persons on a two days' tour; whose town, as a grand climax, entertained them and 2,500 others at a barbecue, dance and speaking. Judge Hunter is the pioneer of the project, and he showed part of it to me. We saw it in the raw.

After a day in Carlsbad Cavern we camped at a spring squarely on the New Mexico-Texas line, proceeding the next day to the ranch home of Tom Gray, at the head of McKitrick Cañon. McKitrick and Big cañons were that day's objective.

We ascended McKitrick six miles by motor over a winding road which Hunter himself had had built for the comfort of the governors' party. The road ended at a level and broad bench above a bubbling spring. Big Cañon was covered by horse and afoot.

Water! Without it land becomes desert. Without water the crags and cañons of mountains would never resound to the call of animals, and our diminishing wild life would be deprived of its last natural refuge from hunter lust. At sunset, coming out of Big Cañon, we seated ourselves beside a boulder-strewn waterfall. The hour had brought the magical hush which Nature, in her remoter retreats, interpolates between the ending of day and the coming of night. A thousand-foot mountain wall rose beside us, laying its broad shadow over the cañon. Along its scarred face were holes—some large enough for bear, some small enough for rock wrens—and from one (who could say which one?) came a crying of a family of eaglets querulously demanding their supper. We saw an eagle wheeling so far overhead that he seemed a mere blot in the blue. Had he heard that faint call? We saw him execute a grand spiral, then sweep downward below the mountain rim and from our sight, and Hunter pointed to the water.

Water! McKitrick Cañon and the more spectacular Big Cañon have hundreds of springs and fountains and waterfalls. They are never still, be the season wet or droughty, but like living things leap on and on, here sinking beneath a dry gravel be

Guadalupe Peak, the "break off" of the range. In this picture it is more than a mile from the man.

A "close-up" of Guadalupe Peak though taken from a point three miles away.

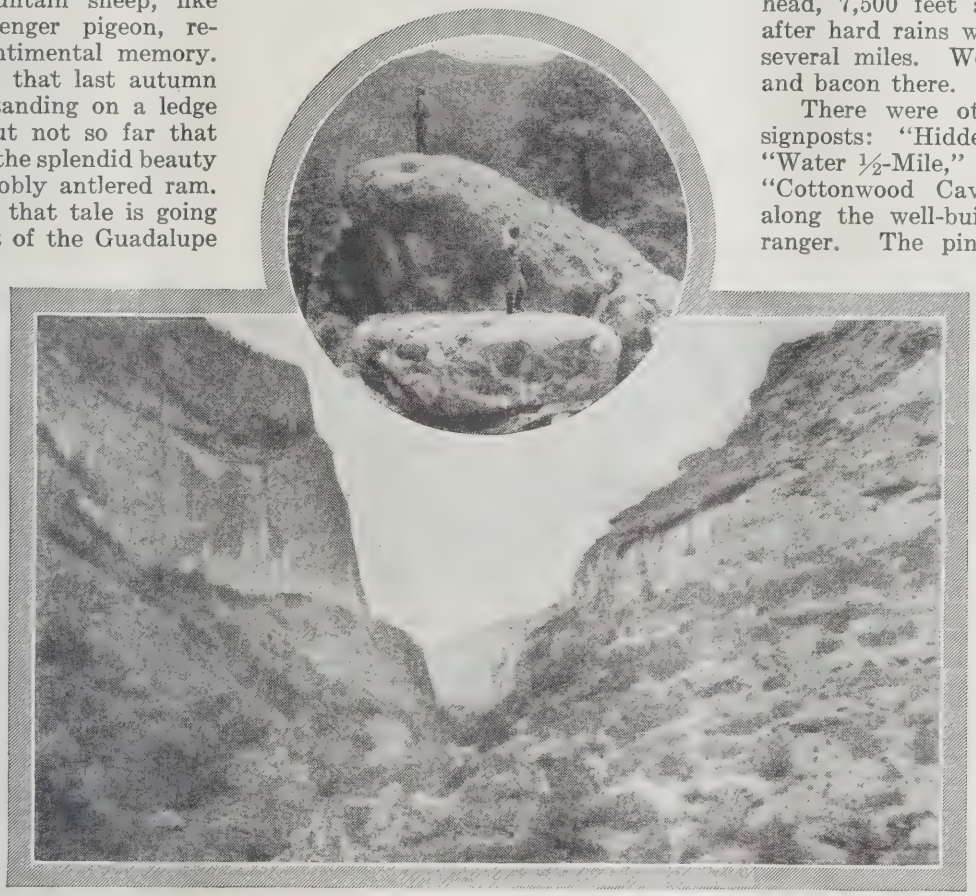
there springing out to continue their joyous course.

Not only eagles live there. The Guadalupes shelter large numbers of deer, panthers, and mountain sheep. When the white oaks fruit abundantly and the manzanillas bear their red apples, hundreds of acorn and fruit-loving black bears appear unexpectedly from nowhere to wax fat and lazy as the magical autumn passes. I have read that the mountain sheep, like the vanished passenger pigeon, remains as but a sentimental memory. Tom Gray told me that last autumn he counted forty standing on a ledge beyond gunshot, but not so far that Gray could not see the splendid beauty of their leader, a nobly antlered ram. If the repetition of that tale is going to disturb the quiet of the Guadalupe cañons with the pop-popping of city guns, then I shall wish it were left untold—but the government will prevent that sort of thing.

Night overtook us in the cañon. We were only a mile from the bench where our horses waited, but a mile of Big Cañon travel is the equivalent of five miles of plains travel. The route outward was a pick-your-way over large boulders caught up by torrents in days gone by and tossed helterskelter across narrow passageways. It culminated in a steep climb, hand over hand with the aid of a rope, and a frantic leap for a level though slippery rock overhanging a pool of icy-cold water fifteen feet deep. Venus guided us out. Big and brilliant, she appeared over the eastern mountain wall in time to confound my stubborn insistence that we were headed due west and therefore were lost.

Next day Gray, Hunter and I left the ranch at sunrise, on horses. We were to "top out" that day and see the country from above. It was two and one-half miles to the foot of Mount Gray (named by me, that day), a perpendicular 1,500-foot peak guarding the eastern end of Big Cañon. When Gray pointed out our route as being straight up the mountain flank—Golden Stair he called it—Hunter insisted that a goat could not climb it, let alone a horse and man. But we made it without accident, and in two hours were on top of the range.

On our left were Big, McKitrick and Pine cañons. Beyond Pine Cañon rose the stupendous break-off of Guadalupe Peak lording it over the Texas plain. On our right, eastward, Gunsight, Double, Slaughter, and Rattlesnake cañons, and, beyond them, Carlsbad Cavern. On either side, tumbles of rock and stunted growths of oak and cedar bent to fantastic postures by the winds which sweep these high places without hindrance. Straight ahead, the dimly descried tops of tall



Entrance to Big Canon. Insert—Huge boulders in McKitrick Canon.

pines with their promise of leafy forest avenues. Beyond them, northward, Dark Cañon and its farms and the well-developed alpine resorts of Cloudcroft and Alamogordo—the Sacramento, White, Capitan and Gallinas ranges—and then the Rockies themselves. Water was to be had only in the cañons. We were terribly thirsty from the climb.

Gray said: "Boys, where you're standing not a dozen others have stood in the thirty years I have lived in these mountains. You're sure away from wife and the home now."

We traveled through the Forest Reserve for one hour before we approached the head of Gunsight Cañon. We wanted nothing, Hunter and I, so badly as water. "How far to water?" Many times we fired that question at Gray, and each time he patiently answered, "Oh, about three mile. Watch for the sign."

Presently we saw it, a welcome sight to weary travelers: a white board nailed to a tree with neat green lettering and green border, and the familiar Forest Service shield. "Water ½-Mile," it read. Then, hours later it seemed, "Black River Spring ¼-Mile," an arrow designating the way. The spring was only a trickle—the Guadalupes have had no real rain in three years—but the point was, it flowed. It was water. To two parched travelers whose thirst vastly amused the third traveler it seemed more beautiful than a singing waterfall. It rises in the cañon's head, 7,500 feet above the sea, and after hard rains waters the cañon for several miles. We cooked our coffee and bacon there.

There were other Forest Service signposts: "Hidden Seep ¼-Mile," "Water ½-Mile," "Helton Cave," and "Cottonwood Cave." We traveled along the well-built trail of a forest ranger. The pines grew thick and tall, with here and there a fragrant juniper thicket, a clump of wild cherries, white oaks, manzanillas, mountain maple, and an occasional cottonwood with twisted body and wildly tossing arms. On the plain the prevailing plant life had been thorny cacti, chaparrals, catclaws, and greasewoods; on the mountain it was the water-loving softwoods such as grow along the Atlantic hinterland. The mountain top sloped gently, there were few rocks, and the soil was loose and rich.

"Right along here," Hunter said, "we will build a fine automobile highway around the cañons to Guadalupe Peak and down McKitrick to the flats."

"Yonder," Gray said casually, "goes a deer. See it, boys, just over the rise? Can't say whether it's a buck or doe."

A goat herder's cabin stood on a windy promontory above Gunsight Cañon. It was stoutly built of logs and, though long disused, was in excellent repair. The rafters had been floored and the south wall left open. The herder's bed of pine boughs, yellow now and powdery dry, was just under the roof.

"B'ars must a bothered him. Reckon he was a faint heart," Gray said.

The cabin stood at 8,000 feet, commanding a noble view south. Beneath it and below the rim of the promontory was the fifty-foot elliptically shaped entrance to Cottonwood Cave. We had been making for this place all day. Few have seen it; nothing is known of what the interior holds beyond the first mile. *(Concluded on page 25)*

Goldbeaters' Craft

The goldbeaters' craft originated when man learned the disadvantages of pure gold for idols and monuments. Egyptian, Asiatic and Greek evidences of the craft exist since the earliest times. It was the Egyptians who taught the Israelites to fashion articles of beaten gold for Moses' Ark.

The process is such that when the gold is alloyed with silver or copper different colors are produced in the finished product. Gold leaf is not sold by weight but by superficial measure. As the increasing quantity of alloy diminishes the malleability, there is little inducement to use the baser metals as an adulterant. The gold is alloyed with a small amount of pure copper and silver, about 12 grains of each to the ounce of gold 998 fine. It is then cast into oblong ingots an inch wide.

The ingot is flattened out into a ribbon about 1/800 of an inch thick by passing it between polished steel rollers. This ribbon is annealed and cut into 210 pieces approximately one inch square. These are now placed between intervening pieces of vellum with plaster of paris on the pieces to prevent them from sticking. The packet is bound and fastened and beaten with a hammer weighing from 17 pounds upward, or by a power hammer, until the gold has been extended to the size of the parchment sheets. The gold squares are now divided into four by a knife and placed between sheets of goldbeaters' skin about 4½ inches square.

They are now beaten with a lighter hammer and after another quartering and beating process we have 3,360 leaves, each with a thickness of about 1/200,000 of an inch. The goldbeaters' skin referred to is a delicate membrane prepared from the intestines of cattle. When properly prepared, this skin may be beaten continuously for several months with a 12-pound hammer without material injury.

Beaten gold was much used for gilding mummy cases, and throughout the ages rich garments were embroidered with goldbeaters' thread.

What Is a "Claptrap"?

Ever since the development of human speech, interesting words, not of an original scientific source, have been added, by every generation, to the spoken language by reason of discoveries, inventions, practices and changes which have constantly taken place.

The origin of these "made" words, of which there are now literally thousands, is always interesting.

For instance, the word "claptrap," which Webster's dictionary defines as a "trick to gain applause," has a primitive source about which it is very interesting to know. Probably having been in use a thousand years before the first dictionary was compiled, its meaning has been so adulterated by improper use and application that the definition may be misleading in relation to the picturesque origin of the word.

The aborigines of many countries which abounded in game birds resorted to many artful and ingenious devices to capture food for their dinner tables, one of which was the "claptrap."

The wild duck always has been the *piece de resistance* on the table of the epicure, but was difficult to secure until the bow and arrow and shotgun were invented. Instances are recorded where snares were designed for their capture; but the aborigines, probably finding it too slow a process, resorted to the scheme of capturing ducklings and raising them until they were ready to be eaten.

Their strategem was to take up a place of concealed observation close to the edge of the shallow pool to which the wild ducklings came to feed, but before they had learned to fly. Waiting until just the moment the duckling returned to the surface from a dive for food, the aborigine would clap his hands instantly and loudly. The duckling, in consternation, immediately descended without having taken time to take in fresh air. Each time the diver reappeared, he was greeted by another vigorous handclap, and each time diving again without having a chance to breathe. Within six or seven minutes, the duckling, having become exhausted by this peculiar process of suffocation, and being unable to further respond to the "claptrap," was easily captured. The aborigine waded in and took him, or them.

By this method whole broods were captured and reared—and eaten.

In next week's DEARBORN INDEPENDENT there will appear an article specially written for this magazine by Sir William Arbuthnot Lane, Bart., the eminent surgeon and Europe's foremost food specialist, who brings a message of renewed hope to those who are in dread of the most insidious of all diseases—*cancer*. Sir William holds the opinion that this dread malady is preventable, and gives reasons for doing so. The contribution will be one of the most important of its kind ever published.

Auctions

Few realize that the auctioneering profession can be traced back to the ancient Babylonian custom of selling marriageable girls to the highest bidders at an annual assembly held for the purpose. Auctions were common among the Romans. Rome itself was offered in auction by the Praetorian Guard, after the death of the Emperor Pertinax.

There are various forms of auctioneering. In a "Dutch auction" the property is offered at a high price, which the auctioneer lowers gradually, until a price is named which is accepted by the bidder. Here the offer is by the auctioneer and the acceptance by the bidder. An auction sale "by inch of candle" was a method employed in olden times when it was the custom to set up an inch of lighted candle, the last bidder to name his price before the burning out of the wick being the declared purchaser. This method was officially sanctioned by an act of William III for the sale of goods imported from the East Indies. Both the Dutch Auction and the Inch of Candle Auction are practically obsolete in England and the United States.

In Great Britain a law of Henry VII's, afterward confirmed by Charles I, prohibited the conducting of auction sales by all persons except certain licensed officials known as *outropers*. In 1799 British auctioneers combined for the advancement of their calling and a meeting took place at the Piazza Coffee House, a well-known London resort of the period. Here the Society of Auctioneers came into being. Today the membership in the Society of Auctioneers totals nearly 6,000. In America, as a rule, an auctioneer must have a license, either from the state or the municipal authorities. While engaged in bringing the property to a sale, he is the agent of the seller only. As soon as the sale is made he becomes an agent of the purchaser as well as of the seller, for the purpose of making a memorandum of the sale which will satisfy the statute of frauds. The auctioneer has a lien on his principal's goods in his possession and on the proceeds from their sale to the extent of his commission and expenses.

An auction should be fairly conducted on both sides. There should be no "puffing," bidding by dummies or other underhand practices in the interest of the seller. The seller should not be allowed to bid unless he has stipulated for that right in the conditions of the auction, or the right is accorded to him by statute, or by court order. Also, any concerted action by bidders for stifling the sale is likewise illegal and unethical, may warrant the auctioneer in refusing to accept bids, and may possibly entitle the seller to avoid a sale.

Romantic Rascals—No. 4

(*Concluded from page 17*)

packed off to Africa, to James Fort on the Gambia, where, to relieve the dullness of life, he turned to cards and dice, became involved in a controversy that meant a duel, and, before the day of battle, shipped on a home-bound trader under an assumed name.

Now a man with a capital consisting of a pleasant voice, an irresistible manner and an ingratiating smile may do much, even with bankers. Impersonating his brother again, he found tradesmen who were eager to avoid exclusiveness, young men willing to play cards for high stakes, and money-lenders glad to do business on rigorous terms, so he played the game of man-about-town with great spirit and his bold experiment succeeded. Indeed, he not only married a wealthy woman of beauty, but, when real conditions were discovered, his wife's friends, to avoid disgrace, bought him an ensigny in the 34th regiment of foot.

That was in 1740 and marked the commencement of two years of social pyrotechnics. The Parsons house in Poland street became a glittering center of extravagance, of riotous living, of endless waste. It was the meeting place of brilliant rakes, of roisterers, of wits and of men of the world. There were all-night gambling sessions when the wealthy and titled lost thousands of pounds at a sitting. Always something exciting was going forward and, for a time, it seemed as though William Parsons had the riches of Potosi at his call. But the dark came with a rush. Forgery was proved against him and he stood in the dock, his fair-weather friends fled, and received a sentence of seven years' transportation to Maryland. Of the truth of other charges made against him there lacks support. For there were not wanting those who held that part of the riches that he squandered during those two blazing years, came as proceeds of highway robbery. It was said indeed that Parsons, in league with a certain Henry Cook, had robbed those of his guests who had won at cards, or at least that Cook had been the highwayman, sharing with Parsons. But there is no way of knowing, for Cook refused to plead and was sentenced to be pressed between stones and weights, suffering on September 5, 1741.

As convict in Maryland, William Parsons was restless. Being assigned as a servant, in the manner of the times, he stole the swiftest horse he could lay hands on, dashed out of the place one night with tremendous clatter, shouting and shooting, left a trail of five robberies near Annapolis, sold the stolen horse, found a ship and worked his way as sailor to England.

It was the highway with a swift horse, silver-mounted pistols and a black mask then. Between Harrow on the north and Epsom on the south, the gaily dressed Highwayman with the Ruby Ring plied his trade and at last came in touch with the handsome and debonair James McLain, the same who robbed Walpole in Hyde Park. But McLain, inexorable logician, held that there should be honor among thieves, a tenet to which Parsons could not subscribe. So the partnership broke up and the man with the ruby had to do his highway robbery alone. And one day he made an onslaught upon a ruddy-faced gentleman, a country squire, who resented the incivility of being stopped by a masked man, so, seeing nothing but an infringement of personal liberty and being blind to the romance of it, he grappled with the robber, dragged him from his horse and gave him a sound drubbing. Then, bundling him into the coach and tying him with his own belt, he drove him to town and delivered him to the officers.

Parsons passed part of his time in prison merrily enough, eating and drinking and card playing, enjoying his cakes and ale, and kept up the merry dance until the morning of February 11, 1751, when he heard voices outside his cell and the sound of heavy steps upon the stairs. He broke down then and wept bitterly, realizing that family influence had failed and that his last hope was broken. So at last the Highwayman with the Ruby Ring sat on his coffin in the hangman's cart and rode to the gallows at Tyburn. There was one moment when his shining wolf's eyes blazed forth as, the rope about his neck, he shouted out something about injustice and prejudice. But a moment later there was an end of the man of exaggerated individualism and one rascal less walked the earth.

Heritage of Mountain and Canon

(*Concluded from page 23*)

There were no cottonwoods thereabouts; the entrance was fringed with oaks, maples, and wild cherries. The herder had strung a wire fence around the hole; his fuzzy and ignorant and sacrilegious goats had slept there seeking refuge from wind and rain, and defiled the place a distance of two hundred feet.

Having surfeited ourselves among the grandeurs of Carlsbad Cavern two days earlier, Hunter and I perhaps missed some of the thrill this tucked-away place will impart to visitors of the future. The entrance is so broad that one may travel several hundred yards without a lamp; indeed, may read a newspaper by sunlight. On either wall, about forty feet high, runs a four-foot ledge as far as the eye reaches. From either of these balconies one might look down into a long and narrow auditorium capable of seating 2,000 persons without crowding. Graceful onyx draperies hang from the ceiling among numberless stalactites. The stalactites are small, but there are stalagmites seventy-five feet high with bases ranging from five to fifty feet in diameter. Dust hangs heavily on these jewels of Nature. Where the sunlight ends and the twilight begins queer figures arise: a large conical stalagmite in the exact shape of an Indian tepee; a marvelously carved totem pole surmounted by a helmeted Statue of Liberty as faithfully done as if copied; and, where the twilight is swallowed in the gloom, peering from behind the tepee, a thirty-foot profile of an Indian sentinel, sharp and clear and forbidding.

Homeward!

We came an hour before sunset to the rim of Big Cañon. Thousands of cliff swallows were sporting themselves over the void. We pushed large rocks over a 1,000-foot wall, and recoiled to their reverberating answer. A pull, a heave, a toppling boulder volleying down the mountain with the thunder of great cannon finally to die in faint crashings—it drove the birds utterly and abruptly mad. They darted about our heads in indescribably graceful sweeps and curves. As far as we dared look we could see their erratic dartings as they followed the rocks downward.

When we go again it will be *de luxe*, over a paved highway, in a big white bus carrying twenty other sightseers, and at Cottonwood Cave and Carlsbad Cavern will respectively lunch and dine at ornate hotels, with shining silver and white napery, and be expected to tip the waiter and hat girl beyond our means.

Of all that I feel certain. The government simply cannot afford to overlook the Guadalupe region in its park program. It is wondrously beautiful, and it is accessible. Putting it in slang, it "has everything."

The Making of Thomas Carlyle

(*Continued from page 19*)

excursions and a doctor who threatened to kill himself if Jane did not marry him. Nothing is wanting in the piece at all.

Wilson is about the first of many who have reviewed to see that it is not high tragedy but serio-comedy in which a good time was enjoyed by all. The lady was won, the rivals beaten, the doctor did not kill himself, Mrs. Welsh gave them her blessing and wisely refused to live with them. When the wedding was over and they were come to their honeymoon cottage Jane Carlyle, according to Wilson, said only two words—Voilà Tout (that's all); which was quite enough and would hereafter be a good way of disposing of the domestic relations of the Carlyles.

Carlyle had to make a living and his struggle to find a proper life work was hard enough and raised a proper dust, and is the third thing which made him. He had an academic Scotch education. He went up to Edinburgh when he was 15, on a cart-load of potatoes with Tom Smail, who sounds like a fancy of Barrie's, and took his Classics, Mathematics and Logic in due course with a bit of Theology and a touch of Law. He was an uncommonly good mathematician and might have adorned a university chair therein, though Professor Carlyle or Dr. Carlyle would sound strange. But university opportunities went by favor and he had little favor with the authorities ever. He tried more than once to get something at 200 pounds a year, but he never got it.

He had no choice but to write, and all his life what to write and how to write it and how to get oatmeal and potatoes out of what he had written were troubling questions with which he wrestled sore. He learned at some cost that he was no poet though he was never anything else, for there is in all he said and wrote such glow of true poetic fire as no man of his time had. But he could not rhyme and the verses he wrote for Jane—and a man will write poetry, if ever, when he is young and in love—are sad singing. He tried fiction but his only novel is a warning to posterity and he wanted the light touch of the facile essayist, yet there was in him a burning urge for utterance. What should he utter?

He was a pioneer in German and got going by interpreting Goethe and the German poets and dramatics to the Scotch and English world. Such essays are not likely to be listed as best sellers and he should have been more grateful to the editors of solid reviews who gave him space and good guineas. But he must write a book. That book looms almost pathetically through reams of his letters. He would win Jane and fame by writing it and Jane was inclined to make the fame a condition precedent to winning her. But as far as the book goes he won the bride first.

(When he had written "Sartor Resartus"—and it is the greatest little book of the nineteenth century, with the stuff of everything he did later and the travail of his soul and his understanding of life and eternity and a deathless, kindling force in it—he could find no one to publish it, and no wonder, for it is the queerest book which ever puzzled a publisher. He finally got it out in parts to the bitter criticism of the profane, but his fame, though he did not know it then, was secure.)

Arrival in Edinburgh.

He took eventually to history and half his gusty protests against the entire human order was that he ever had to write history at all. He had the sound instincts of the scholar and the impatient soul of the poet, and it was hard driving the two.

He is at his best in biography. He could get at the inwardness of a man with a surer instinct than any biographer of his time, and etch him into the picture with an acid pen, his epithets stick like fate. First and last he made a modest living with his pen. The cheapest thing heretofore in the world's markets is the genius of a great writer. Homer, Dante and John Milton never got royalties enough between them to buy a good motor car. Neither did Carlyle, but he managed to keep a saddle horse in London. He got his breeches from a Scotch tailor whose creations challenged time and change; he wore a free-and-easy hat, had always a roof over his head and no notes coming due. He got his first returns from "Sartor," as a book, from America and through the practical kindness of Emerson, and spent them for signet rings for his wife. This seemed an extravagance to his friends and they invested the second installment for Carlyle's own good; they got him some bottles of the best French brandy.

Carlyle's health, about which he was never reticent, has been as much considered as St. Paul's "thorn in the flesh." Various specialists have been inclined to claim his physical weaknesses for their own department and to suggest to the world that, had he been under their care, he would have been a better man and Victorian literature received a more shining adornment. Eyestrain has been suggested among other things, but Wilson, with the approval of the faculty and a judicious review of the symptoms, votes for biliousness. Carlyle saw the world with a sometimes jaundiced eye. If Carlyle lived a troubled life it was not for the want of Castor Oil. That was at one time an excellent lubricant for carriage wheels, but in his case it served literature in differently. Something in Carlyle's philosophy must be allowed for a man who would go to bed on one potato and sleep badly enough.

But he was tough as an "oak clog." He was born before the world had heard of Napoleon and died one month before James A. Garfield was inaugurated President of the United States. His dyspepsia did not shorten his life but it did affect his outlook on the century through the long heart of which he lived. And perhaps he served his time the better for it. He held that no one should be at too much "eaze in Zion," and a good digestion may make a man unduly complacent.

But what really made Thomas Carlyle and is the key to his abiding force was his struggle for a faith. Religion is as native to any son of Scotland as the mists of the highlands. You may make too much of race, but the Celt has always lived in the sense of unseen realities and possesses at his best such power to make real to others in the luminous and kindling assurance of his speech, the visions which are peculiarly his own, as no other race has ever had. The Scotland of Carlyle's boyhood was tempered in the stern confidences of John Calvin and trained in the discipline of his great church. Centuries of struggle for the freedom of his fathers had wrought that faith into the fibre of the Scotch soul. It was an awesome thing to question it, and to try to leave it was as if a man should try to escape himself. He would take it with him

his flight and affirm it in his very denials.

And Carlyle through an inner compulsion, the secret travail of which he could never share with the world and never did share with the world, left the faith of his fathers. I doubt if any biography can ever do justice to what it cost him. He had a secret which he kept to himself; he tells you more of his biliousness than of his soul. Something you may read between the lines of "Sartor" and you may guess at more behind his reticence, but I think the greatest thing which made Thomas Carlyle was his struggle for a living faith. Wilson touches the edge of the drama but you feel something deeper you cannot reach.

He Would Not Be a Minister

Somewhere inside him always was his ancestral religion and the mystic spiritual passion of his race bred to the last fiber of his soul. He was meant for the ministry as was every Scotch lad of parts and humble birth, but after an honest effort to conform he gave up the ministry and supernatural Christianity. He thus hurt his father sore; James brooded long over it in a silent Scotch way but never reproached Thomas. His mother mourned a son lost to the kirk, but lived to be comforted. His neighbors gave him a bad name and called him an atheist. Scotland herself was strangely slow to acclaim him; perhaps this was the reason.

But Carlyle suffered most. The key to a deal he wrote and said and the travail of soul in which he lived is just here. For a while he thought himself a stoic but he was never that, being a man of vast and sensitive capacity to suffer and hiding, as such men do, a nature keen to be played upon by all sad and shadowed things behind a pretense of hardness. He called himself a mystic, but he was not that as we talk of mysticism now. He ended by falling back upon the great simplicities. For he is, when all is said and done, the prophet of the great simplicities—and the great mysteries. He preached the simplicities endlessly. "Do your work and do it well." "Toil on, toil on; thou art in thy duty, be out of it who may." Be sincere and trust the truth you know though the heavens fall. Burn your own smoke—(which he never did). The only values are human values and an age or a system which subordinates a man to a machine is blind and stupid and will pay the price of its stupidity.

Democracy Versus Leadership

He was never by temper a Democrat and though he had no use at all for the reactionary temper of his time and the state of England before the reform bills, and was proud to be known as a Radical, he expected little enough from reform bills and popular majorities without sound leadership and right human nature. He was a Radical in the liberal meaning of the word; he wanted to get at the roots of character and society. He was led, therefore, to make much of the strong man, though his strong man must always be wise and unselfish and with no mind at all except the mind of the general good.

Somewhere at the heart of all that he wrote and said about the right of the strong and the foolishness of the crowd was the entirely sound feeling that no reorganization of society, nor any extension of the franchise, nor any glorification of Democracy could ever make leadership less necessary. On the contrary all these things were likely to make it more necessary than ever.

He knew, as wise men have always known, that a man should not be in bondage to things and he illustrated this very nobly in the brave simplicity of his own life. For we sadly misunderstand Thomas Carlyle if we do not see how brave he really was and what a price he was willing to pay for his convictions, and how he never essentially failed in any duty, and how his life was a long, long struggle against inner and outer difficulties before which he never for a moment lowered his high standard. There was in the man a majestical quality which slowly emerges as you read his life or study his work, a majestical quality which is perhaps more than any other single thing the secret of his power over his own time.

But if there were nothing more to Thomas Carlyle than this, the greater part of him would still be wanting. He preached the great simplicities, but he invested them with the transforming splendor of the great mysteries. No man felt so deeply the haunting mystery of life, no man ever sensed more surely the reality of the Unseen. Everything he touched became to his vision and understanding of it an aspect of the Infinite and Eternal. A man is himself a spirit and a part of the spiritual order. "Life is a little gleam of time between two eternities."

There is no force nor reality save in the spiritual. We make the outer world out of our own inner force and vision, and if it be anything besides what we make it, it is the living visible garment of God woven on the roaring loom of time. If we have eyes to see behind the temporal aspects of things we see only the force of the spirit endlessly in action. We may set our own mark upon seeming stubborn stuff, "can the earth, which is but dead and a vision, resist spirits which have reality and are living?" But "whence and whither sense knows not, faith knows not, only that it is through mystery to mystery, from God to God."

Such things as these Carlyle said over and over again and here, I take it, is the secret of his timeless power.

Shall People or Politicians Rule?

(*Concluded from page 15*)

amendment there is a 3 to 1 chance of ratification, when the legislatures are the sole determining factor, but, if the people of the states are permitted, when they so desire, to be heard through a referendum, or, if not, one branch of the legislatures of any state which ratifies must have been elected after the question has been submitted, the ratio would be reduced 9 to 1, which may or may not be true according to individual speculative inclination. At least, the speculator must base his calculation on his comparative opinion of the attitude of legislatures and the people toward amendments to the Federal Constitution of their country. This objection is offered in a spirit of distrust of the people.

The further objections were made that this proposal did not provide "that ratification shall be by a majority either of those voting upon the question, or of those voting at the election or of those qualified to vote and "there is nothing in the proposal to prevent a state from passing a law providing that a constitutional amendment must be ratified by two-thirds or three-fourths of the people." These are details which are left to the states as they are now left under the present Federal Constitution.

It is rather surprising that leaders of Labor unions, who recently were advocating amendments to elect Federal judges by the people and to empower Congress to overrule judicial opinions, should be strenuously opposing and placing themselves on record against a proposal that liberalizes the mode of making amendments by giving opportunity for popular expression instead of leaving it to the exclusive prerogative of legislatures. Is it because they believe, that, as to the amendments they have been advocating, their organized influence will be more seductive over legislators than their persuasive power over the people? Is the Constitution of the United States to remain the People's Instrument, as it was in the beginning, or the plaything of Washington lobbyists skilled in all the arts of legislative coercion?

This spirit of distrust toward the people, so strongly evidenced by those who are pretending to serve the people, calls for serious scrutiny.

Early American Bibles

Some Quaint and Curious Editions of the Scriptures

By LOUIS C. KARPINSKI

THE first Bible printed in the United States was the John Eliot translation in the Massachusetts Indian language, published in Boston in the year 1663.

Eighty years later another Bible issued from the American press, and this time a German Bible following the translation of Dr. Martin Luther. This appeared from the press of Christopher Saur, a native of Germany, who came to America in 1724. Christopher Saur was a devoutly religious man, with a sincere interest in educating the German Americans of Pennsylvania among whom his lot was cast. Bibles were then imported from England and a tax of sixpence an ounce was collected as duty. In addition, the expense of purchase by an agent and transportation added materially to the cost. To remedy this Saur induced several German Bible societies and publishing houses to assist in spreading the gospel in Pennsylvania.

The interest aroused in Germany by Saur's communications bore fruit in the gift by the Dunkards (or Tunkers) in Germany of a press with type and also a quantity of books. The task of setting up this press finally fell upon Saur, then a preaching physician having been trained in German universities. In 1738 Saur began printing in Germantown and to the present day the name has been honorably associated with printing in Pennsylvania.

In 1739 through the Almanac which he published and also through his newspaper Saur issued a Proposal to print a German Bible. This was for that day a major undertaking, requiring much more type and paper than a printer would have in stock. Again assistance came from Germany, a whole font of type being presented to Saur by Dr. Heinrich Luther, a type founder at Frankfort-on-the-Main. The Bible was completed in 1743, the title-page being printed in black and red type which was common in many early printed books. Like the Indian Bible this also was three years in the press. Twelve hundred copies were printed and the price was placed at eighteen shillings. For Dr. Heinrich Luther twelve copies were prepared in special binding and these were sent on the ship *The Queen of Hungary*, which fell into the hands of pirates. Finally, the Bibles, as Dr. Luther himself wrote in his own copy, "through a wonderful dispensation of Providence, after a lapse of two years, were released from the bands of robbers, and delivered uninjured to the Luther Printing House." Dr. Luther distributed copies to a number of German libraries where they are for the most part preserved to the present day. Both Luther and Saur were undoubtedly unaware of the appearance of the Eliot Bible, as both speak of the work as the first in any language to appear in the New World.

A second edition of this Bible appeared in 1763 and a third in 1776. On the invasion of Germantown by the British it is related that nearly all copies were destroyed by using the Bible for gun wadding. However, quite a few copies are to be found, today, largely in Pennsylvania libraries.

In addition to the whole Bible, Saur printed eight editions of the New Testament which fact testifies to the popularity of the Bible in Pennsylvania from 1745 to 1775.

PHILADELPHIA

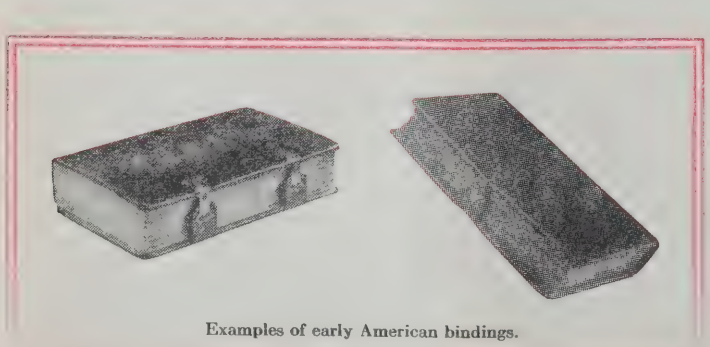
The first English Bible printed in America, by Robert Aitken.

The first English Bible in America was asserted by Isaiah Thomas to have been published in Boston in 1752 with the imprint: London: Printed by Mark Baskett, Printer to the King's Most Excellent Majesty. Thomas states that this was "in order to prevent a prosecution from those in England and Scotland who published the Bible by a patent from the crown or *cum privilegio*, as did the English Universities of Oxford and Cambridge." However, diligent search has failed to reveal any copy with the above imprint and it is considered by competent experts that no such edition appeared either in England or America.

As early as 1710 Cotton Mather completed a manuscript of a Bibliotheca Americana and attempted to secure a publisher. In 1713 and in 1728 Mather made efforts both in England and America to achieve publication but without success.

In 1770 a Scotsman, John Fleming in Boston, prepared an elaborate prospectus for "The First Bible ever printed in America," including even specimen pages. Nevertheless the project came to nought on account of the great cost of the undertaking.

During the Revolutionary War the cessation of importation of books from England caused a real dearth in that then widely read book. So serious was



Examples of early American bindings.

the situation that the attention of Congress was directed to the matter and in 1777 it was proposed "to import 20,000 Bibles from Holland, Scotland, or elsewhere, into the different parts of the States of the Union." About this time Robert Aitken, of Philadelphia, issued a New Testament, the first in English to appear in America. Second, third, and fourth editions followed in 1778, 1779 and 1781 which encouraged the printer to bring out an edition of the whole Bible. A petition to Congress for support and sanction received the official formal approval and recommendation of the work "to the inhabitants of the United States." The Bible appeared in 1782 and was bound commonly in two volumes. The page measures approximately 6 inches by 3½ inches wide. The title-page contains the state arms of Pennsylvania, with the motto, "Virtue, Liberty, and Independence." The Resolutions of Congress approving the work appear following the title-page, and occupy one and one-half pages.

The British Museum has a copy of the Aitken Bible with the following inscription: "This first copy of the first edition of the Bible ever printed in America in the English language is presented to Ebenezer Hazard, Esq., by the Editor." Hazard was an intimate friend of Aitken who laid aside for Hazard the first sheets of his Bible as it issued from the press.

Aitken was nearly ruined by the publication of the Bible as it came at a time when competition with English Bibles was restored. In 1789 Aitken memorialized Congress on his loss, with a request for exclusive right "to print the Holy Scriptures of the Old and New Testaments, for the term of fourteen years, within the United States." It is almost needless to state that this extraordinary request was not granted.

The Aitken Bible ranks in rarity and in market value with the Eliot Bibles. As early as 1891 the work sold as high as $650. Copies came to the auction book market very rarely.

From the time of Aitken on, the Bible appeared with commendable regularity in the United States and even to the present day ranks well up among the "best sellers."

Harrow-on-the-Hill

(*Concluded from page 12*)

ther for a resting place." Many wealthy citizens prayed to share his retreat; but the prior, with prudent forethought, admitted only his personal friends, and those who brought stores for the blockade.

On the morning of the fateful day, there was a great exodus from London, crowds of men, women and children fleeing to the Northern Heights beyond the city. But, as the chronicler has it, "the Thames, unmindful of the foolish crowds upon its banks, flowed on quietly as of yore. The tide ebbed at its usual hour, flowed to its usual height, and then ebbed again, just as if twenty astrologers had not pledged their words to the contrary." But the prior got out of the difficulty easily enough when London rose in its wrath against him. By a slight error, he explained the date of the awful inundation had been set a whole century too early. That generation would be safe, but let the generation of 1624 beware, for London in that year would surely be washed away. And so the prior dismantled his fortress and passing along the road through Wembley returned with his household to Smithfield, and Harrow on its hill was left in peace.

But it is, of course, Harrow school that has made Harrow-on-the-Hill famous the world over. It began in a humble way, for the founder of Harrow was a plain yoeman, John Lyon, who lived in the hamlet of Preston, nearby, when Elizabeth was queen. And he had a great love of learning and a great desire that the "poor children" might be instructed. And so after setting apart "twenty marks" yearly for such instruction, he at last, in the year 1571, obtained letters patent and a charter from the queen to found a "Free Grammar School" at Harrow, and to draw up statutes for its regulation and government.

Lyon of Preston, yoeman John,
Died many years ago,
All that is mortal of him is gone,
But he lives in a school I know.
All of them work at their cricket there,
And work at their five times three;
And all of them ever, since that day,
wear
A ribbon of blue like me.

The present school lies to the south of the church, while the masters' houses are scattered over the town. It has grown greatly since the days of Yoeman John, but the most interesting building is still the "Fourth Form Room," the original schoolroom of the Lyon's foundation. It is a plain enough room, with all the original fittings strangely well preserved. For the "man of imaginacion" it has one special interest; for on the old oak paneling with which the room is surrounded are the names or initials of some of the most eminent men in modern English history who were also sons of Harrow. Admiral Lord Rodney, Lord Palmerston, Richard Brinsley Sheridan, Lord Byron and many others. Byron cut his name large and with some show of workmanship. Today, the names of those who have become "Old Harrovians" are carved by "a hired and experienced hand." No doubt it is better so. But Harrow guards jealously the time-worn "marks" of her older sons.

Soviet Russia

(*Concluded from page 5*)

department store; patronize a government barber shop and a government laundry. You attend concerts given by the government's orchestra in a government theater. If you live in Moscow you even pay rent to the government.

Of late, however, significant news has been coming out of Russia. The foreign correspondents there announce that the Soviets have now embarked upon a *Newest* Economic Policy. The government, apparently, has recognized the futility of doing everything for, by and through itself and has declared for a return to Lenin's policy. That the extremists who are now in control could make such a concession is significant. It means, if these reports are authentic, that private business will once again be asked to reënter the country—not only at the fair at Nishni, but in all of the other cities.

There are no leaders, so far as I know, in Russia, who deny that the country's great need is capital. Capital, it was thought, might flow into Russia even with the government in charge of all the channels of business. That belief, evidently, has been dissipated. The Soviet dictators are ready, so they report, to make the necessary concessions to insure security to private traders who wish to enter what, very easily, may become one of the world's greatest markets.

Whether foreign business men will readily accept this invitation is doubtful. Individuals, unless they possess a goodly amount of surplus for investment, will hardly care to risk their resources in a country where economic conditions are so uncertain.

Mexican Pawnshop

IN MEXICO City there is a government pawnshop, known locally as "El Monte de Piedad." Here money can be borrowed at a fixed rate of interest per annum and if the article pawned is not redeemed after a specified time it is sold by displaying it with a marked price which is its true value. If the article is not sold after a given period the price is lowered from time to time until it is sold. When sold the actual costs of selling with interest is deducted and the balance is given to the holder of the pawn ticket. This government pawnshop operates under established rules and its reputation for integrity appears to be very good. In addition to the government pawnshop, there are a number of privately owned ones in the city, operated by the ubiquitous "Uncle," which do not vary in any essential of practice from those in the United States and other parts of the world.

Little Trades of Paris Streets

(*Concluded from page 2*)

Children had formerly an assured income by selling rabbit skins from two to five sous—this after much haggling. But nowadays the "*peau d'lapins*" willingly pays 25 sous for the smallest skin of any tame rabbit, and that sum seems appreciable enough to the housemaid who collects it herself.

"Come on nearer, come on!" A simple scarlet covered board held on two wooden horses and a barrister's eloquence, that is enough to stop—especially on Sundays—the pedestrian traffic on the sidewalk and gather the crowd around the "*camelot.*" What does he sell? Things not to be found in any store: handy oyster-openers, universal paste, manifold needle-threaders, up-to-date garters, latest style pegs, inkless fountain pens, and little cardboard wrestlers, magic tops, wooden acrobats, jumping bunnies, a multitude of articulate, animated, original tools, and toys made up with odds and ends, with also the particle of genius, the inborn gift for invention which characterizes the true "*camelot.*" Transplanted in America that "*camelot*" would soon have an office with a stenographer and possibly a shop where hired workers would manufacture his invention in quantity. But here, he is both boss and laborer, the brain which creates and the machine which makes. He scarcely abandons his attic or his sidewalk. Gibbling! Yes, that is the wrapping of his goods, and who would imagine a more attractive one? With an amazing facility of elocution the "*camelot*" fluently runs through all types of orations—with strong argumentation and appropriate gestures. And that draws a strikingly Parisian audience, "*badauds*" (loafers) who are out to enjoy the out-of-door dramas which the boulevard freely presents at every step.

For the loafers of the Third Republic are not so very far from the Parisians of Louis XIII, who used to gather at the Pont Neuf, around the musician monkeys of the once so famous Tabarin. If they are no longer interested in monkeys, the modern loafers are interested in "musicians." To listen to the last "romance" which at every block violins and guitars, mandolins and cellos spin out to the crowd, they stoically endure burning sunshine or numbing cold. While the musicians play, one of their associates sings, and the crowd hums, then joins in the chorus and begins all over again until everyone—the gentleman in overcoat as well as the white-clad "*mitron*" (baker's boy)—knows by heart both words and melody. Who said that, in France, everything ends in songs? In fact, all big events are thus recorded for posterity. The Revolution left us "*La Marseillaise*" and the World War "*La Madelon.*" Political moguls as well as Landru cannot escape the special publicity which the street singers lavish upon their names with satirical stanzas. All our presidents had to go through that ordeal, Fallières with his family, Deschanel with his pajamas. The English Channel is no boundary to the laughingly biting music; echoes of the boulevards are still mumbling "Lloyd George." And just a few days ago there ran a little chilly murmur: the Bobigny school of Bolshevism, mysterious red "cells" and anarchical "honeycombs" edified in the dark and hatching the Revolution with a "R." All that has now landed on violin-strings and accordion folds at street corners; the gentleman in overcoat and the white-clad little "*mitron*" sing it with the same sense of humor.

Bric-a-brac, Quai des Grands-Augustins.

"Why have a Revolution," the "*peau d'lapins*" said to me yesterday. "Why have a Revolution when folk can afford eating so many rabbits!"

And afford loafing after work, and afford singing, and enjoying the joy of life in the buzzing streets of busy Paris.

Overworking State University Presidents

(*Continued from page 8*)

"Show me a university where the deans of the colleges are willing to accept their share of the burdens and responsibilities and who will persistently look to their colleges in terms of their relations to the university as a whole; show me a university where this policy has become established as a tradition, and I will show you a university where the president is not overworked. I will show you a university president who is happy in the thought that he is able to devote his time, his energy and talents to the more important affairs and educational policies of the university."

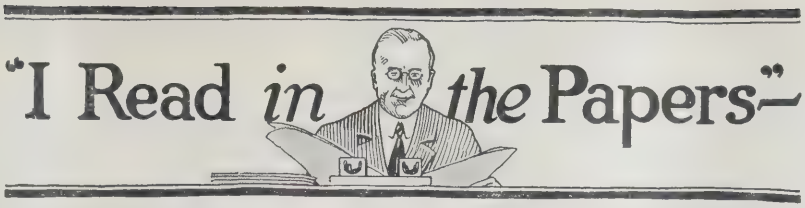
That most of the state universities must ultimately undergo a reorganization of their methods of supervision is admitted by regents, faculty members, educational leaders and by practically every president. The suggestion of change most frequently offered is a diarchy which will place the details of business in charge of competent officials and leave to the president the broader policies of education. Some urge the adoption of plans such as have made possible the administration of the affairs of the modern large corporation—a president to outline the general policies and the chairman of a board of directors to carry them out. Recently the Chicago system of vice-presidents as a method of adjusting the responsibility has attracted a great deal of comment in academic circles. It has not had sufficient trial to warrant extended presentation.

If the universities are to attain the high ideals expected of them by the people of the state, there must come an adjustment which will leave to the president the full uninterrupted direction of the educational affairs of the institution. To others can be delegated the task of operating the institution on a business basis, the presentation of the economic needs of the institution to the legislature and the supervision of the buildings.

University leadership comes through inspired educational leadership. Buildings in large numbers do not make a great college or university. They help in the attainment, but are aids only. Expensive libraries are not the criterion. There are more books on the shelves of the smallest institution than the student can find time to read. What then is the predominant factor? The answer is simple. The distinguishing characteristic of a university is the quality of the product it produces. The test is: Does the institution develop better men and women?

Now the answer to this question cannot be found in a day or a month. Look back a few years into the lives of the graduates. Their success reveal the stimulus back of the achievement.

(*Concluded on page 31*)



I read in the papers that President Reynolds, head of the largest bank in Chicago, celebrated the twenty-fifth anniversary of his exodus, or emancipation, or whatever one may call it, from farm life, by exploiting his philosophy: "Don't try to sow and reap at the same time." All right, George, but it's a good bet if you had kept at sowing, literally, you never could have reaped the material success you have. Besides, fields are not always harvested by the seeder and banks merge sometimes.

I read in the papers that New York and one or two other coast cities are showing a pronounced tendency toward the ornate, overloaded Romanesque style in architecture and interior design. In fact, New York has shown such a trend for years. Side by side with this stifling tendency runs a feverish craze for the exotic in art—for rootless art. The tone of life as lived among the swift in these cities receives sufficient exposition in the Sunday feature sheets and need not be dealt with here. Here is the "deadly parallel" our Viewers with Alarm have been talking about all these years. Our fate, they say, shall therefore be similar to that of Rome. However, these well-intentioned persons should remember that the fate of a man does not depend on the whims of the charlatan to whom he tosses his surplus change.

I read in the papers a great many fine sayings, full of "pep" and almost too obviously designed to serve as optimistic "shots in the arm." To induce us to go forward in a balanced fashion, it might be a good idea to meditate a moment or two on the opposite of optimism, that is, on despair. A human being in despair is not pleasant objectively, nor comfortable inwardly. He is dull, sluggish, uncaring. But isn't it possible that these features of despair are evidence of life's desire to conserve him—to give him a rest? He has probably been hitting too nerve-tearing a pace, carrying on too sanguine a struggle, racing toward a breakdown. So life deflates him for a while, and the condition of deflation is called by us despair. While he lies in sodden indifference, life is re-charging him with fresh energy, and one morning he wakes to a new and happy consciousness of power, ready for the battle again.

I read in the papers that Señor Pio Baroja has written an interesting preface to his new book. Baroja is not so well known over here as his countryman Blasco Ibañez. Why? Well, here is one reason: "I have never (he says in one of his books) been a believer in the absurd myth called Bohemia. . . . Bohemia is utterly false in Paris . . . but in Spain, where life is difficult, it is even more of a cheat. Bohemia is not only false, it is contemptible. It suggests to me a . . . sect, of the most inconsequential degree, nicely calculated for the convenience of hangers-on at cafes."

One can hardly imagine Greenwich Village mooning over a man like that.

I read in the papers that Professor Charles C. Marden, of Princeton, recently found among old documents in a secondhand bookstore in Madrid, Spain, an authentic fourteenth-century manuscript of the works of De Berceo, the earliest poet who wrote in Castilian. Professor Marden has earned the homage of the Spanish nation by presenting his find to the Spanish Academy and contenting himself with a photostat copy that will be available to American scholars. This is in significant contrast to the Spaniards who conquered and ransacked Mexico for gold and burned the historical manuscripts and literary works of the Aztecs. These manuscripts would have revealed much now unknown history of the New World.

I read in the papers that Paris is getting ready for the American tourists and their pocketbooks. Announcement is made of impending auctions of oddly termed "priceless" works of such eighteenth-century "masters" as Boucher, Fragonard, Greuze, and Watteau; and also of the modern Renoir, Cezanne, Vuillard, and Gagnat. Happily for real art everywhere, the day has passed when the possession of a typical French painting confers distinction on its American purchaser. Foreign artists, who used to prosper through their ability to unload anything upon rich Americans, are now chagrined to find that we give first choice to the fine, sincere works of American artists.

I read in the papers that medical experts declare that the prediction made in 1909 by Professor Irving Fisher that the average span of life would be increased by fifteen years has virtually come true. This is largely the result of the positive activities of the Life Extension Institute with which Professor Fisher is prominently identified. This group of real workers for the betterment of the race now feels justified in believing that the span of life will average about 65 years in 1930.

Overworking Presidents

(*Concluded from page 30*)

"President John Bascom's addresses and his work in the classroom were among the most important influences in my early life," declared a distinguished graduate of the University of Wisconsin recently and this sentiment can be duplicated at nearly every dominating educational institution.

Achievements at a university come through the leadership of men. Material things are only agencies which facilitate their advance. There are few jobs in the nation more difficult to fill than the chair of a state university president. The head of an endowed institution must be a great educational leader. A state university president must be more. He must be able to impress both scholars and the general public of his right to lead. But before his leadership can be effective he must be relieved of irksome demands.

The Oregon Seacoast

Where the Rogue River of Oregon empties into the Pacific Ocean near Gold Beach, some giant has poured a handful of granite into the boiling sea. Rocks in piles, rocks isolated with the tide rushing and foaming about their base lie all about. Here the breath of the salt water greets the nostrils. The shifting wind changes the color of the water. It shades from green to deep blue. Sea gulls soar with hoarse cries or poise with flapping wings over some great water-swept boulder sighting some morsel in the sea. Shells of exquisite shape and color litter the beach. To the right, Skookumhouse Butte is wrapped in the sea mists of the summer afternoon. The waves boom ceaselessly against the base of the great boulders and far out on the bosom of the Pacific a vessel steams north to Portland and the mouth of the Columbia. Festoons of foam run, tipping freshly, along each wave as it lifts and rolls shoreward. Occasionally these rollers increase in fury until they become violent, affording a magnificent sight to the spectator. They dash with terrific force against the sentinel rocks.

The Humor of the "Rabbit Man"

An Artist Who Has Transformed Br'er Rabbit Into a Living Character

By GRACE E. POLK

HIS friends call him "The Rabbit Man."

And when a man has drawn, or painted or etched, say a thousand rabbits, and has, tucked away in the corners of his brain, all ready to produce when the urge gets him, thousands more, he should be entitled to the name.

It was about ten years ago that Fred W. Bock, of St. Paul, began to "say it with rabbits." Mr. Bock, quite a young man then, for he is still only bordering on youngish middle age, had been an art student in New York, a spender, a wanderer, and, in the course of a rather free life among all sorts of people, had acquired a mild scorn for the usual habits of getting and spending, and an altogether humorous outlook on men and their doings. Then came the rabbit idea and Mr. Bock began to express life as he had seen it in terms of rabbits.

This being his idea, as he might tell you rather incoherently if you should talk with him, his rabbits, of course, are not rabbits at all, but rabbit men. Old men that he had seen along river towns of the Mississippi, darky types from farther south, rich and immensely important town aldermen, he drew with hairy faces, long ears and flappy forepaws. It was a sort of game that he played with himself, trying to see how absurd he could make men by endowing them with the absurdly profound gravity of the rabbit. He drew them with as little idea of "doing something with them" as could well be. But since they reproduce humorously and with insight so many sorts of people that everyone knows and has enjoyed, these rabbit men of Mr. Bock's entitle him to a unique corner, unpretentious though it may be, in the art world of today.

Mr. Bock works in half a dozen different mediums—pen and ink drawings, quick pencil sketches, water color, etching on copper, and dry point, but his happiest medium is one that he has developed for himself. It is one used, more or less as a pastime, by the etchers of the Barbizon school, and known by them as *cliche verre*—etching on glass, or, to be more exact, perhaps, using the glass as a block from which to print. The method is little employed among artists of this country, but Mr. Bock's versatile handling of it and the effective results he gets should encourage its wider use. The compositions are etched on glass, or rather on some opaque ground, such as paint or ink, covering the glass, and the printing is a photographic process. More recently Mr. Bock has drawn his pictures in ink directly on the glass, instead of cutting them out from a dark background, thus making his glass plate a positive instead of a negative, and obtaining his positive print by a double photographic process.

The advantages of the *cliche verre* process are twofold, its cheapness and the very practical one to the artist of being able to get a great many effects out of the same plate. Where the copper plates for a dozen etchings cost several dollars, the glass costs but a few cents, and if the artist is willing to trust his prints to the somewhat perishable film or paper negative, the glass plates can be cleaned off and used any number of times.

An afternoon call.

With a persistent curiosity and a feeling for dramatic lighting from this simple medium, Mr. Bock has obtained quite unexpected results. Some of his more carefully done prints have almost as much depth and feeling as copper etchings. The effect of radiant vibrating light, he obtains successfully through stippling. In a recent print, something of an experiment, out of a dimly outlined house and a few cross lines, he creates the effect of a blinding snow storm, through which an old rabbit beats up against the wind, with his hands to his freezing ears. Some of his prints, made on semi-transparent paper and colored in low tones, and varnished, have much the effect if not all the brilliance of stained glass windows.

But though his method is interesting and original, it is really the wealth of humor in Mr. Bock's rabbit world that makes it unusual. Why he chose rabbits, it is hard to say, perhaps because the rabbit is such an innocuous little animal that almost anything may be done to it with artistic impunity. If you ask him, "Why rabbits?" his answer is, "Why not rabbits?" The idea is not a new one. There have been Uncle Remuses and Br'er Rabbits and Mr. Wigglies in this country for years, and much longer ago—centuries in fact—the old engravers and etchers used animals to depict the frailties of men. Mr. Bock lays no claim to originality for the idea, but his rabbit men are quite different from any others, quite his own.

Through all of Mr. Bock's hundreds of drawings of rabbits, a dozen or so of his favorite characters run. There is "Bull Head Jo," an alert and chippe old man, absurdly curious, interested in all of life that doesn't matter. His hard-fisted, middle-aged wife usually stands glaring at him from a doorway, trying, and always in vain, to drive him to work. There is the village gossip, who poses as a wheelwright but whose real calling in life is talking it over. Not a townsman drives by but he finds time to emerge from his shop and have it out with him about the latest village scandal. There are the three wise men who gather in the village store to settle all that is or ever will be. They are the storekeeper, a crafty, tight-looking rabbit, who, one may see, puts by his pennies daily; the complacent rich rabbit, whose money plainly has been in the family a long time, stubborn and self-satisfied, and the village lawyer, an easier going middle-aged fellow, open to conviction to either side, one who might ask, like Pontius Pilate, "What is truth?" These three, Mr. Bock says, "rule America."

There is the old bachelor who sits with his cat by the fire. His is a quizzical, cautious old face, a man of affairs—many affairs, a little rotund and his thoughts in the past. There is the busy, hard-working artisan, unimaginative and practical, and the idler who "sits at his ease in his inn," watching while others work, a restful life whose hardest task is smoking. There is the superstitious man, for whom the world may at any moment become full of the unnamed dread. A gnarled tree, a rustle by the roadside, a garment hanging in the shadow start fears that set the hair on end. Then there are a hundred onlookers who watch the game played out by these just men, rabbits.

The horseshoe game.

Saturday night rehearsal.

Moonshine fancies.

The stranger within our gates.

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

THERE is doubtless a feeling of resentment in some breasts when you say that the man looking for a job is really looking for help. In recent years we have been reared on a feeling that we have certain "rights" which we ought to "demand." Yes, we have rights, but "demanding" doesn't procure them. Our very rights are given us by the help of others. One of our rights is security of life and liberty—never having lived in a society where men are not sure of either of these, we do not vividly appreciate these rights. But we could not enjoy them were it not for the help of others in preserving them for us.

Where Past and Present Meet

Trying to Get an American Meal

By A. R. PINCI

CHRONICLER OF THE NEGLECTED TRUTH

BRIEFLY TOLD

A "man-trap with crocodile teeth" was set 100 years ago, in England, for poachers. This contrivance was forbidden by law in 1827.

"Treacle and brimstone," or sulphur and molasses, the remedy of grandmother's day, contained what is now known as Vitamine B, and its administration was based on sound nutritional wisdom.

St. Joseph's, the church of the Franciscan Fathers in Los Angeles, advises against the use of wedding marches by Wagner or Mendelssohn. "We can well dispense with these compositions," says St. Joseph's calendar, "so utterly out of place in the presence of the Sacramental Savior, in Whom neither of these two men believed, one being an infidel and the other a Jew. Save the organist the embarrassment of refusing and yourself the humiliation of being refused."

Basketball was invented in 1891 by James Naismith at the suggestion of Dr. L. H. Gulick who saw an opportunity to fill in the time between the football and baseball season with an indoor game.

Young men who wish to fly are advised to apply to the aviation unit of the Twenty-seventh Division, New York National Guard.

West Virginians propose to call their state Kanawha, the original designation of the state, as the people are tired of being taken in the North for Virginians.

Russian railroad stations are provided with hot water tanks where passengers can obtain water to brew tea. Travelers carry small teapots for this purpose.

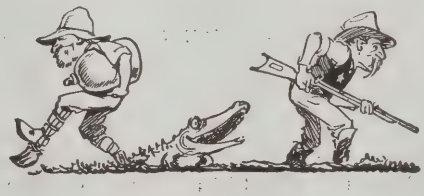
Sherwood Forest is to be saved from despoilers, the L., M. & S. Railway Company having decided to withdraw its line which was to cut through the historic wood.

Iowa plans to preserve the oldest railroad station built west of the Mississippi. It is an historic building in Davenport, occupied formerly by a pioneer who later turned it over to the railroad as a station.

A new anesthetic, a substitute for cocaine, has been discovered by an experimenter working on products to be manufactured into artificial rubber. It is non-poisonous in practical use.

The origin of the spoon is uncertain. We find table forks as early as the thirteenth century, when they are mentioned as being kept for special eating purposes.

Chocolate brandy drops, owned by an East Side confectioner, and valued at $15,000, were destroyed by representatives of the United States marshal's office in New York City.



A Florida moonshiner wore cow hoofs attached to his shoe soles to mislead the revenue officers who thought the tracks were made by cattle going to water.

Hobson's choice is so called in allusion to the practice of Thomas Hobson, 1544-1631, of Cambridge, England, who let horses, and required every customer to take the horse which stood nearest the door.

Seamless steel tubes were born when the practice of bicycle riding was popular a generation ago.

Public libraries once arranged their books according to size, instead of according to subjects or authors.

The guard at the Washington Monument climbs to the top of the structure, 555 feet, every day on a trip of inspection.

The flames from the waste outlets of an oil well in Turner Valley, Alberta, have forced plant growth to the extent that blooms are opening six weeks ahead of their normal time. Wild strawberries were picked in the vicinity shortly after the snow left the ground on the adjacent prairie.

A species of wasp in China eats through the lead sheath on cables, mistaking them for bamboo, boring holes to deposit their eggs therein.

At one European court the British ambassador is said to spend $100,000 a year of his own money in maintaining his establishment in a manner befitting his position.

Prospecting for gold by airplane is the plan of an enterprising miner who will fly over the Cassiar district of British Columbia and when he sees a likely looking creek will land and look it over. If results warrant he will leave his partner and drop over to Wrangell for supplies.

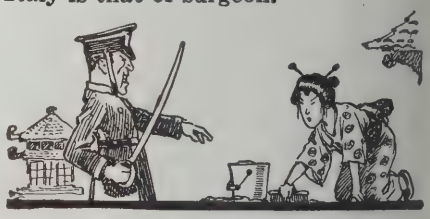
The notes of the hunter's horn are heard every evening in the British law courts when the Middle Temple is in term. The "hunter" is the senior warden of the Temple who warns the law students and others to get ready for dinner.

Some butterflies make extended migratory flights, often in enormous numbers and over hundreds of thousands of miles.

Swiss girls of high school age wear their hair in two long braids that hang in front of their shoulders rather than down their backs.

The bifocal lenses for spectacles were invented by Benjamin Franklin in 1784.

The best-paying profession in Italy is that of surgeon.



Spring and autumn cleaning in Japan is a matter regulated by the police who, on an appointed day, appear armed with swords. They draw a cordon round the specified quarters to see that the official orders are carried out.

Six hundred patents for new devices to curl hair have been issued by the Patent Office in Washington.

Change of Address

1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

Presented in This Issue:

Mr. Ford's Page this week treats again of modern ogress from an unusual angle. Nothing is more de- able now than that men should understand this time which they live and its place in the schedule of the rld's advance. This Page will somewhat help. (p. 11)

Cancer!—one of the most dread and hopeless words the language. We debated about putting an article out Cancer in a June issue of this magazine. It seems at variance with the season. Yet it would be a glo- us June, indeed, if this article prevented tragedy. Sir illiam Arbuthnot Lane is a surgeon respected by the ole world of medicine, and his preventive prescription Cancer is so simple, so easily within everyone's reach, at we give it here as he signed it with his own hand. any rate read it. It is good for health in general. (p. 2)

There are many other delightful bits in this magazine: he Closed Gentian" (p. 15), "Castles in Spain" 32), exploration, garden and nature items, and so on.

Mr. Pinci is not only a well-known writer, he is also nething of an ocean-jumper. His story of his en- avors to get an American al on an American ship is st amusing. On the side you y pick up a number of sug- tions as to what is at bottom his whole shipping question. 6)

It is just as well that we uld begin to understand the nch. There will be more or talk about the French debt, l Americans should know at the plain French people up against. Information is essary to opinion. Mr. lip Carr describes exactly at the Frenchman is carrying r. (p. 14)

There is a laugh in the title f Tom Masson's article— nerican Humor—No Laugh- Matter!" We have humor; have humorists, but they being spoiled. We are ask- them to be funny at 10 a.m. ime for the afternoon news- ers, and extra funny all day dnesday in time for the Sun- a feature pages. Humor can- not be put on a production basis. Mark Twain did not contribute to syndicates. Leacock was funnier before the publishers discovered him. You will read in this article the meaning of many things you have wondered about. (p. 16)

Eighty-three thousand per cent profit—of course it is impossible except with legislative connivance, public indifference and all the other elements that go to destroy the balance between service and profit. But it has been done—see page 30.

You have heard a great deal lately about Barton, the great Lincoln biographer. Completing his monumental two volumes of new and corrective Lincoln material, Dr. Barton started off around the world, and he was good enough to promise to write from each country he visited. This he is doing. This week he gives us a common-sense slant on the vexed question of Americans being the most flattered and yet the most hated tourists. (p. 5)

Bees!—with ants and man they seem to show an intelligence which baffles intelligence. Have you ever read Maeterlinck's "Life of the Bee"? If not, read this article. If so, of course you will read this article. It is told by a man who has lived with bees all his life. Many of our readers have doubtless heard him lecture, with his hive of bees before him. Besides producing a billion dollars' worth of commercial wealth a year, bees must be credited with the work of pollinization which gives us our great fruit crop. Man is not the only useful being. Indeed, the earth as a planet could more easily spare man than the earthworms or the bees. (p. 19)

There are 10,000,000 Slavs in the United States. They are a valuable and appreciable addition to the nation. But who are they? whence are they? and what are their characteristics? Professor Jenks, an anthropologist of note, gives an authoritative and sympathetic study of this virile race. (p. 25)

Cancer Can Positively Be Prevented

Message of One of the World's Most Eminent Surgeons and Dietitians

By SIR W. ARBUTHNOT LANE, Bart.

I SHALL not die of cancer. I am taking measures to prevent it. What I am doing anybody can do. It is not a matter of money. It is a matter only of forethought and forbearance.

What I am doing everybody should do if he would avoid the risk of death from a disease more terrible than tuberculosis, syphilis and a number of other awful diseases rolled into one.

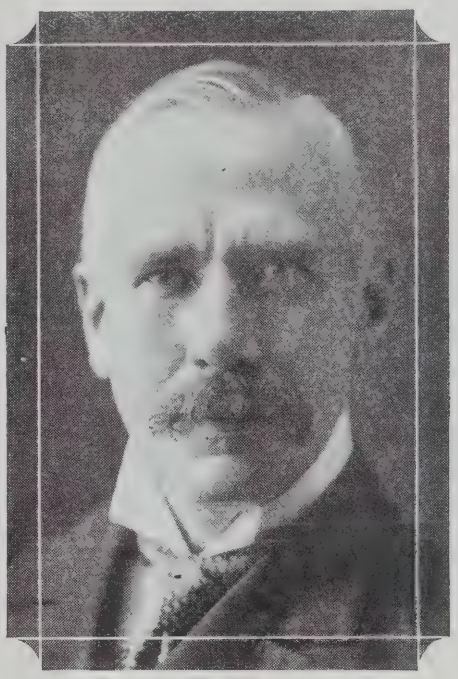
Cancer is the great human menace. It is increasing by leaps and bounds. If anything, it is increasing more rapidly in the United States than it is in the British Isles. Of those now living in the British Isles, 5,000,000 are doomed to die of cancer if they do nothing to prevent it. In the United States, the doomed number is 10,000,000 and may quite easily rise to 15,000,000 or 20,000,000.

This means that at least one in ten of those now living in America and perhaps one in five are doomed to die of cancer if they do nothing to prevent it. But for those more than 40 years of age the danger is far greater than that. Cancer seldom strikes until the victim is at least 40. The percentage of any community that is 40 or more is but a fraction of the total. This might be called the cancer fraction. There the disease does its worst. One and perhaps two out of every five Americans of this age are doomed to die of cancer unless they do something to prevent it. And, unfortunately, women are in the greatest danger from the fact that cancer strikes them a little earlier than it does men.

What picture of impending fate could be more awful than this? How terrible it is only the physician knows who has seen human beings slowly eaten alive by an ailment that spares neither king nor peasant. Yet I paint the picture not to terrify, but to move to preventive action. Civilization has made cancer. What it has made it can destroy. We can be as free from cancer as are savages to whom the disease is apparently nearly if not quite unknown. Savages become cancerous only when they come within the influence of civilization and wrong their bodies as we wrong ours.

A great flood of light has come upon cancer. We now know what causes it. It is not the bacillus that scientists have so long sought and not yet found. It is caused by poisons created in our bodies by the food we eat. I am speaking now, of course, in a general way. A few cancers are caused by bruises, but it is a question if bruises would ever cause cancer if poisons had not first done their work to the tissue.

What causes poisons to accumulate in the body? Bad drainage. Nothing else. The body was never intended to be a traveling receptacle of perishable commodities, the waste products of which should be carried about for twenty-four hours or more at a time. We were never built to bear the strain and we are not bearing it. We are breaking under it. We are breaking out with cancer and a large number of other diseases, all of which have the same origin. There is but one cause of disease and that cause is poison. We



SIR W. ARBUTHNOT LANE, Bart.

may take in poison through the air, but we manufacture most of it within ourselves from the food that we eat.

We eat three times a day and sometimes more. Our bodies should be cleared as often as we eat. Animals do not need to be told this. Savages do not need to be told this. But we need to be told. The seeming requirements of what we call civilization have come in the path of our instincts. We eat regularly and expel irregularly. We eat frequently and expel infrequently. We live in a house that is called our body and we do not drain our house.

What are "we"? We are little cells. According to the scientists one little group is the heart, another little group is the stomach, and the combination of all the groups is the individual. We eat frequently, expel infrequently, and poisons are set up. These poisons enter the blood stream. Every part of the body is reached. Every part of the body suffers. The body resists. It tries to bear up under the burden. It tries to set up antidotes to the poisons. It thickens the walls of parts of the intestines to enable them to bear a load for which they were not intended, but in trying to offset one evil creates another by decreasing the capacity of the intestines.

The body fights back and does hard—but it dies. It does not die the day the poison is introduced. It makes a losing fight for years. But eventually the break comes. It comes where the strains of poison and the strains of life meet. What I mean is that the strains of life may and usually do bear upon some parts of the body more than others. If one is doing work that requires the expenditure of a considerable amount of brain power, he puts a strain upon his nervous system. This strain might not and probably would not hurt him if the poisons that he is manufacturing within his own body were not also putting a strain upon his nervous system. The two strains meet. The man goes down with paralysis or some kindred ailment.

He goes down because he did not drain the house in which his cells lived. We do such terrible things to the little cells that live in our house. Nobody would treat other persons as he treats his own cells. Imagine a man having a great house and filling it with guests, then stopping the sewer and filling the rooms each day with a number of dead cats. With the rooms reeking with foul odors we can imagine the crying and the dying of little children, who may be compared with the more delicate cells of our bodies. As the fumes become heavier we can visualize the fainting away of women. Finally, none are left but the strongest of the men but in time they too die and the house that was once so gay is but a silent sepulcher.

On the theory that most persons care more about themselves than they do about anybody else we can at least imagine such treatment of guests by a host. But how can we account for such treatment of the little cells that live in our houses and are us?

There is no way to account for what civilized human beings do to themselves except to realize the fact that they do not know what they are doing.

We take disease for granted. We assume that it is the inescapable fate of man, sooner or later, to have this or that disease and die with it.

Nothing could be further from the truth. The nature of man is to die as a clock stops when it is run down. Death should come peacefully, at great age, and usually during sleep. Disease of

y kind is certain proof that the body s been misused.

We are indicted by our ailments. iat we have done is reflected in at we have. We should be proud of alth and ashamed of sickness. No man should escape blame unless he n show that he is the victim of iety rather than of himself. Bad using conditions, for instance, for ich no individual is to blame, may d do cause sickness, but most of our we create for ourselves. Anybody n see that the house in which his ls live is drained. Whoever does see to this invites all of the death d destruction that may come to him, cause bad drainage in the human dy is the cause of cancer and most the other ills that afflict mankind. move this cause and we shall have troyed most of the diseases.

Hippocrates, the great father of dicine, knew this, thousands of ars ago, as did many of the ancients, t most of his followers seem to have gotten it.

We physicians should go back to the irces of our information and preach re ardently what was taught so g ago; what is and always will be e—that man by nature is not a son factory; that his body is but a use in which his cells live and that to mit this house to fill up with vage is even worse than it would be maintain an open sewer in one's idence. One might get a breath of sh air once in a while in such a use, but there is no escape from the sons that one carries about in his dy. They are flowing into his blood eam all the ile and prepar- it for all of the eases, including worst of all— cer.

Now what is matter with body that it s not adequate- drain itself? Nthing is the tter with the dy. It was made right. The tter lies with us. have suddenly nged our methods of living. We this change civilization. Part of it ood, part of it is bad. That part of which pertains to our habits of life stly bad because it represents so rp a break with our past. The man body, which has been created ough countless centuries of slow nge, cannot in a day, a year, or a tury adapt itself to an environ- nt that is radically different from rthing to which it has ever been customed. Force such an environ- nt upon it and there is trouble.

That is what we have done. We r trying to force our bodies to in rirely different circumstances than man bodies ever lived before. For millions of years, perhaps, we went on four legs. We now stand erect. For a very long time, after we began to stand erect, we were physically active. We hunted, we cleared forests, we attended flocks. We did everything, perhaps, except to sit at desks, ride in motor cars, eat white bread and other bad food.

Such activity and such food caused good drainage. I am inclined to believe that the average duration of life in ancient times was greater than it is now, but if it was not it was because of perils with which modern science is prepared to combat. The same rice field that keeps the coolie's drainage good produces the malaria germ that kills him. The coolie knows how to eat, but we don't, and we know how to stop malaria, but he doesn't.

We shall never begin at the beginning, in our fight against cancer, and eat the food of some of the lowly peoples of Asia, but we may as well know what it is. It begins with bread made from flour ground between two stones by hand. The flour is coarse and all there—nothing is sifted out to make it whiter.

This flour is moistened with water and made into little cakes. The cakes are placed, one by one, on a flat iron surface that is heated by a charcoal fire. When the cake is scorched on one side it is turned over with forceps and scorched on the other. It is then ready to eat.

With this cake are eaten raw vegetables. A favorite vegetable is the radish which, in that part of the world, grows as large as one's forearm. The natives also eat sugar cane, swallowing some of the fiber.

The first thing that one notices about this diet is that it has bulk. Bulk is necessary to elimination. Part of our trouble is that we shun bulk. We eat concentrated foods. Concentrated foods decay and create poisons to carry around and absorb, but are difficult to eliminate.

The next thing we observe about this diet is that it contains no meat. We think we need meat. An Asiatic can march all day on vegetables and fight at evening. We should never eat any food that, when decayed, has an odor that is exceedingly offensive. All animal products come under this ban.

Your Asiatic eats his vegetables raw. He gets his vitamines, which are so necessary to life and health, while they are in good condition. We destroy ours with heat. Vegetables are better if not cooked.

Lastly, the Asiatic peasant eats bread made from whole grain flour. We eat white bread which contains but part of the grain. White bread is so bad that if fed exclusively to animals for a month they will die. It is not fit to eat. In the first place, it does not contain the food elements that we require. Furthermore, it tends to clog the drainage system. Whoever eats it does so at his peril. Whole-wheat bread is difficult to get in England. I understand that it is easy to get in the United States. Americans who persist in eating white bread and die of cancer have nobody to blame but themselves.

What we should do then, if we would avoid cancer, is to eat whole-wheat bread and raw fruits and vegetables, shunning all meat, first that we may be better nourished, second that we may more easily eliminate waste products and thus adequately drain the house in which our cells live.

But one of the most difficult things in the world to do is to change the food of a nation. The best we can expect to do is to effect as favorable a compromise as possible. Each person can say for himself how far he is willing to go to avoid cancer. Whoever foregoes white bread will perform a great service for himself. It is deadly.

Having done the best we can to avoid bad foods and get good ones, there still remains the problem of elimination—of sure, adequate drainage. Exercise helps. Walk two or three hours a day. How many will do it? Not many, I fear. If not, the problem of bad drainage remains. What are we to do? Should simple measures of diet and habit fail, the freeing of the intestinal canal by operation restores its mechanics to the condition in which it existed in infancy. The effects are tremendous—far and away beyond what I expected. Men and women are transformed. Their very natures seem to change. They become bright and happy and well. Not only do the particular ills of which they complained disappear, but minor troubles go with them.

Obviously it would not do to operate on everybody whose drainage system was not working properly, because that would mean to operate upon everybody. Just as obviously it would have

MORTALITY FROM CANCER
Registration Countries of the World, 1908-1912

Continent	Population	No. of deaths from Cancer	Rate per 100,000 Population
Africa	9,041,866	3,018	33.4
America	382,549,311	251,438	65.7
Asia	272,814,962	148,447	54.4
Australasia	27,886,740	20,345	73.0
Europe	1,431,996,861	1,096,716	76.6
Total	2,124,289,740	1,519,964	71.6

been idle to expect everybody who suffered from bad drainage to correct his habits with regard to diet and exercise. The problem of bad drainage remained. The question was how to meet it.

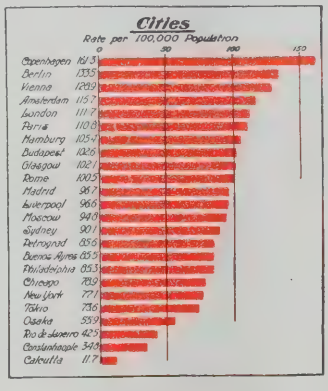
I determined to try mechanical means. I sought a lubricant by means of which I hoped to keep the bowels open. I tried olive oil, but found that it was absorbed before it had completed the lubrication of the intestinal tract. I finally hit upon paraffin oil, a by-product of petroleum, which at that time I was able to get in a highly refined state only from Russia. Now, I am glad to say that high-grade paraffin oil is on sale pretty much throughout the civilized world. In different countries it is put out under different trade names. It is practically without color, taste or odor. In buying it, one should be sure that the label on the bottle bears the statement that it is intended for internal use.

Now what will paraffin oil do? So far as elimination is concerned, it will do everything that proper food and proper exercise could do. It is mechanically perfect. It lubricates without being absorbed. It has no effect upon the body except as a lubricant.

Two tablespoonfuls of it should be taken half an hour before each meal. The reason for taking it half an hour before mealtime is to give it time to pass out of the stomach before the arrival of food. If paraffin oil were to be smeared over food it would interfere with the operation of the gastric juices and probably do more harm than good.

Three doses of paraffin oil a day will insure perfect drainage of the human house. This should be drained three times a day. Once is not enough. Watch the animals. They don't eat white bread and commit our other crimes against themselves. They are well drained. To prevent accidents from the use of paraffin oil, it is best to form the habit of clearing the body after each meal. We should take out as often as we put in. If we would avoid cancer we must cease to be badly drained human houses.

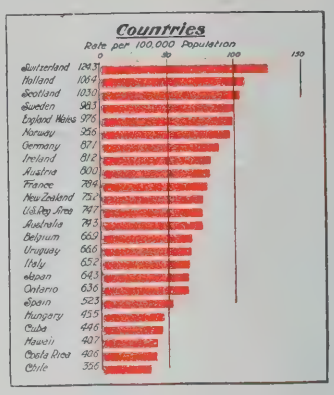
Whoever will correct his diet to a reasonable extent, take reasonable exercise, and a dose of paraffin oil half an hour before each meal need have no fear of cancer. I make this declaration with no reservations. Cancer is a filth disease. I am certain that it is the last stage in a sequence of ailments brought about by bad drainage of the system. I am also certain that cancer never attacks a healthy organ. Tissue must first be weakened by poison before it will yield to this or any other malady. Drain the body and there need be no fear of cancer, appendicitis, diabetes, neuritis, neuralgia, sleeplessness, melancholia, epilepsy and a great number of other ailments.



International statistics of cancer mortality, 1908-1912.

[EDITOR'S NOTE—Paraffin oil is known under some fifty different trade names and sold at many times the price of the basic article. Its most common general term is "mineral oil." The pharmacopeia of the United States refers to it as "petrolatum liquidum." The pharmaceutical preparations of different countries vary in specific gravity from 0.840 to 0.945. The lighter oil is used as a vehicle for sprays, and the heavier as an ingredient of ointments and for internal use. Many claims are made for special desirability of different products. The actual physical differences have to do with absence of color, absence of odor or taste, absence of acid or alkali, and a specific gravity fitted for the purpose for which the oil is used. A responsible druggist should be able to supply a mineral oil of desirable characteristics for internal use under the simple term of "liquid petrolatum."]

When I first recognized the responsibility of bad drainage for certain diseases I did not realize the extent to which poisons manufactured and secreted within ourselves are the cause of the diseases that have come with civilization. As I said, I was dumbfounded at the results often brought about by operation. These results, together with the later results from the use of paraffin oil, caused me to reflect and to investigate still further. The reflections and these investigations made it plain to me that all the glitter as well as the solid achievements of civilization are reared upon a basis of filth. We have new and terrible diseases because we have committed and are still committing new and terrible crimes against our bodies.



International statistics of cancer mortality, 1908-1912.

Every particle of evidence points in the same direction. Your great American statistician, Frederick L. Hoffman, of Newark, New Jersey, penetrated the wilds of Africa and the wilds of Asia only to find cancer and all other diseases of civilization unknown.

But what cleanliness means to cell life is perhaps best shown in the achievement of Carrel, of Rockefeller Institute, New York, in keeping alive, for more than fourteen years now, bits of tissue from a chicken. Nutrition is provided by keeping them in a solution upon which they feed. But Dr. Carrel does not permit the waste products to remain and poison the cells. Instead, the tissue is washed several times a day. These bits of chicken are not only alive but as vigorous as ever after the lapse of a period far in excess of the normal life of a chicken. What Dr. Carrel has done is striking proof of what cells can do if given a chance. But no cell can endure poison. We moderns seem to think they can. The pity is that we do not think at all.

We shall have to begin thinking—and acting—very soon or cancer and its trail of lesser diseases will make an end of us. It is often said by those who know nothing about the subject that the increase of cancer is more apparent than real. Nothing could be further from the truth. Cancer is a world disease—a world peril. Wherever civilization extends it goes — and now everywhere else. In England and Wales, in 1881, the death rate from cancer was 520 to the million and from tuberculosis, 1,923 to the million. In 1921, cancer deaths had jumped to 1,215, while tuberculosis had dropped to 854. In the United states, deaths from cancer jumped from 47,829 in 1900 to 80,938 in 1922.

As cancer has become a greater and greater menace, the

Comparative cancer mortality in American and foreign cities, 1881-1914.

Are Americans Flattered and Hated?

By WILLIAM E. BARTON

ILLUSTRATED BY PAUL HONORÉ

AN AMERICAN cruising around the world gets much material for thought as the ship makes her way from port to rt regarding the feeling of peoples of ner countries toward Americans.

The traveler leaves Honolulu with m one to a dozen wreaths of flowers ound his neck, a great big lump of ntiment in his throat, and his heart ry warm with affection for the islands d the people whom he has visited. e Japanese receive him with a sur- sing cordiality. Instead of meeting n with a demand that he explain the panese Exclusion Law or pay double ce for the kimono he expects to buy his wife, they meet him with rare rtesy, and though he may pay the uble price he leaves with the com- table feeling that he has purchased a discount. Entering Japan at Yo- hama and sailing from Kobe, he ves the port at one o'clock in the rning, and is awakened by the sing- of the people on deck in answer to farewells of a crowd on shore.

The ship comes to Shanghai amid wspaper people with their cameras, d their inquiries for personal gossip out the passengers that may interest English-speaking part of Shanghai's pulation. No one has been rude to n, and Nanking Road has eagerly ceived his dollars in exchange for its res, but the American becomes aware it he has not made the personal con- cts in British Shanghai that he made in Honolulu. Of course he had no right to expect that he would do so.

He goes on to Hongkong, and thinks it the loveliest spot he has seen next to Honolulu. No one is rude to him, but he does not get far.

Then he goes on to Manila, and his experience is almost like that at Honolulu. He is among friends and if he does not know a soul when he arrives he makes friends before he leaves.

Now about that time he begins to compare, and to say, "Why were not those English people a little more cordial at Shanghai and Hongkong?"

I cannot do better *(Continued on page 24)*

The tourist leaves Honolulu with from one to a dozen wreaths around his neck and a big lump in his throat.

Leviathan steaming into New York Harbor—Sky line of New York in background.

What, No Corned-Beef-and-Cabbage

When We Try to Get an American Meal on Board an American Boat

By A. R. PINCI

AFTER spending seventeen days and nights on two American ships on my way to and from Europe—five days on the magnificent *Leviathan* and twelve on the modest *Republic*—I set foot in the United States convinced that neither is a 100 per cent American ship. Something like two hundred different dishes were constantly available from three to five times a day, but there was no corned-beef-and-cabbage. Culinary art never exceeded itself so much as on the larger ship and "real eats" were never so plentiful as on the smaller vessel, but the impression grew that delectable American dishes of the plainer kind were on the defensive, making a decidedly apologetic appearance, to be vanquished by the vast array of costly imported or adapted concoctions.

Is it because simple proletarian foods like corn-cab have been shamed away by constant lampooning? If so, it is time for Americans to try a barrage against *roast prime ribs of beef au Jus*. Isn't anything to be done against that alleged brown gravy that from Sacramento to Danzig has the same odor, same thickness, same taste?

The *Leviathan* once announced a New England dinner; the menu, however, identified ten foreign specialties by geographical or provincial name to every American specialty—when such was included. But when the *Republic*—which as a transportation unit ought to be to the plain people as Adam's rib was to Eve—made the same mistake, signs were not wanting that a moth-eaten fashion was being adhered to. Once only I remember that the *Republic*'s bill of fare placed in the space of honor, at luncheon, so plebeian a dish as pig's knuckles with sauerkraut. There were many takers, even though the day was one for "givers," since the sea was very rough.

I cross-examined Captain A. B. Randall, whose cherubic countenance and cheerful mien seemed to have been the inevitable result of one good, old-fashioned and plain American feed after another. Witness deposed not. So I turned to Chief Steward J. K. Parker. He likewise deposed not.

Be that as it may, the bill of fares are not sufficiently and representatively American. To the inevitable plea—for this I know is the basic reason—that the people do not want what they eat at home I answer that in order to know what travelers want or do not want something more than a unilateral menu is needed. Buckwheat cakes with maple sirup, patent breakfast foods, Virginia ham and "Maryland fried spring chicken" are all very well in their way but they do not go far enough. When anything like baked beans is offered it is too much lik side dish instead of a *piece de resista* And hunting for favorite viands of t sort through a maze of half-Anglici French names is no sinecure.

Our ships being the latest comers the passenger service it was inevita that they should pattern their chefi after methods already in vogue, these are by no means perfect. Ev company advertises its "unsurpas cuisine," but food is all alike, no ma what is said to the contrary. Wh one ship excels in one thing it fails another. Altogether, it bespeaks hopeless goal toward standardiz primary dishes under a nomenclat that makes the following scene—ta from a page of the past—beautifu illustrative.

"Isn't there any soup on t menu?" asked the hungry man.

"There was some, sir," answe the waiter, "but I wiped it off."

In one day 197 items were l fared for us on the *Leviathan*; 77 breakfast, 70 for luncheon and 50 dinner, exclusive of morning bouil afternoon tea and pre-slumber sna which makes an even 200. The hun *Republic* was not far behind, accou ing for 178 items; 67 for breakf 63 for luncheon and 48 for din likewise exclusive of the three peri extras. In many cases some of viands available are the kind n tasted by average Americans, who

ly do not attempt a diversified enu of those kinds in a lifetime t content themselves, when away m home, with only an occasional ange from the old stand-bys of m-and-eggs, beefsteak-and-potatoes, gs-and-ham, potatoes-and-beef-eak, ham-and-eggs and beefsteak-d-potatoes.

Of course, a steamship must rnish a cosmopolitan assortment d a well-balanced variety, but at esent the assortment is too waste- and the variety decidedly rep-tional and uninclusive. This ewarding problem is indeed com-ex, and this is not the place to port it. What I wish to point t, in truth, is that life on a ship w consists of two things: wonder- what you are going to eat at the xt meal and thinking of what u had at the previous sitting.

Food is a great topic of discus-n—much more so than one's low passengers. Inevitably there those who criticize quality and antity—the very two factors that beyond criticism. And particu-ly this is true of that class who were born and bred to bountiful repasts are fearful that in their new guise "globe trotters" that fact might suspected aboard.

I risked my reputation one day for olicly querying the steward about ham-and-cabbage craving that expectedly overwhelmed me. Be-use I was brought up on French and lian dishes I have no hesitancy to st something different and good some typically United Statesian hes. Then the chorus:

"Oh!" said the surprised young y across the table from me.

"What did he ask for?" someone ried his neighbor as if doubtful t he had heard aright.

"Cabbage?" quizzed a man who two dollars' worth of caviar for *rkfast* every morning. "Do you it?"

I obtained my ham-and-cabbage the next meal, having put in a special uest for it, but by time it is appar- to the reader that trouble was not ccompanied by chological risks ht timid passen-es prefer not to face. table company er seems so for-iding and inhu-ne to one, as when h timid soul haz-rs the defense of tain satirized lies.

rinks? Yes, some r the *Leviathan* ward and very ite, invisible at ht, on the *Republic* tward. By all wn rules the *Republic*, with a full cabin list, clearing four wet ports like Bremen, Cherbourg, Southampton and Queenstown, ought to have perspired booze on every table and through every cabin door keyhole. By the same token, the *Leviathan*, leaving New York, ought to have been dry as a hot iron. Yes? No.

Boy Scouts playing game of Cage Ball or "Keep It Up" on deck of *Leviathan*.

But booze was a very insignificant factor, for the passengers in general. On the *Leviathan* it was hocus-pocused from nowhere in particular. Champagne, Scotch, Gordon, rye, vermuth—it was all there. It was slow in making its appearance, but follow-the-leader as a game was played to perfection when the first brave thirsty one opened a bottle. It was all "private stock," put on board by the bibacious ones themselves. One woman confided that she was sorry she lost courage and did not bring a case of champagne. Yet even the steadiest drinkers registered slow consumption.

There was talk on the *Republic* of drinks somewhere below, meaning in certain cabins, but no one emerged bleary-eyed, idiotically scintillating, noisily tittering. In short, "plastering" and "pifflicating," self-imposed duties that rumor in this country associates with the "last days of liberty" to the foot of Bedloe's Island where the goddess stands, and the week-long toast across the "big drink" necessary to produce the effects, did not materialize, and that despite a representatively jolly crowd that revealed very few "drys" among them.

There has been a great deal said about the reaction caused by traveling on the *Leviathan* because of her size. But size itself is never so misleading as when one is aboard. Judged side by side with a tug-boat she is huge; judged without benefit of relativity size is abstract. Meeting once the *Leviathan* in mid-ocean and seen from our comparatively small ship the then famous troop-carrier did not seem so big either—and only three miles from us.

The first urge is to begin mental comparisons with objects or distances with which one is familiar, but somehow even the eye experienced in estimating measurements is defeated. So most everybody finally agrees:

"She did seem bigger!"

And the same would be said by most of us if tomorrow we could board a ship five miles long.

After the first part of the usual whistle notice of departure, which begins with a wheeze, nothing is so absorbing as to watch how delicately, almost micrometrically, the ship is maneuvered. If she were of Murano glass greater care could not be used in easing her in or out. No wonder, when in most cases there is only a foot or so of clearance to bottom!

Passing out into the open sea, however, one forgets or ignores side issues of and about the big ship. The business of getting settled is what counts. Especially if ye traveler dislikes or is dissatisfied with accommodations. Then begins the stampede to the purser's office. Big cities have their housing emergencies; but every purser on every ship can afford to laugh at urban housing authorities, because his own problem is intensified, restricted, overwhelming.

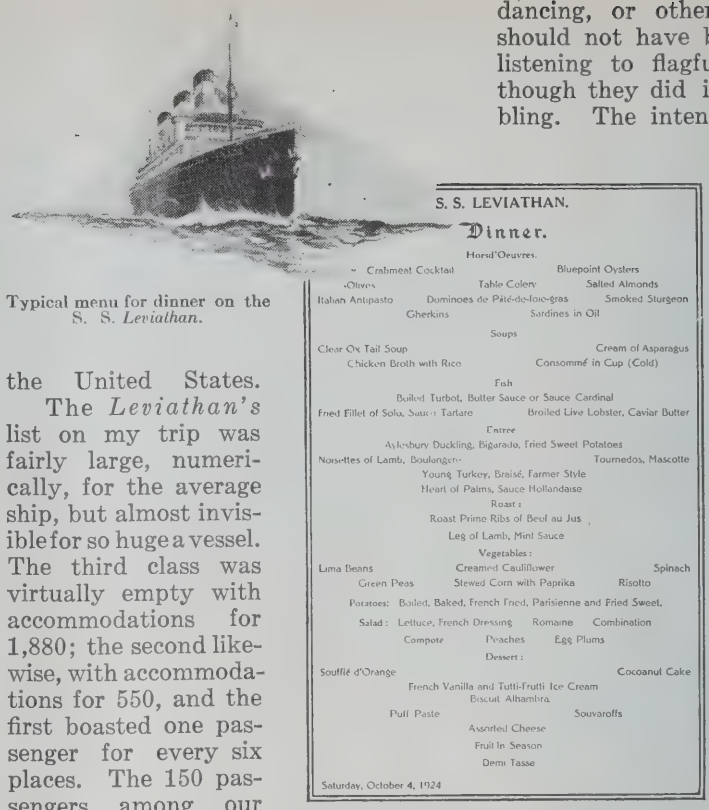
On January first, 1925, the special privilege custom which permitted certain passengers to obtain maximum accommodations for minimum rates, a passenger traffic competitive system that was followed in many ways by booking agents, was ordered discontinued by the North Atlantic Conference. It is the best thing that could be done if honestly and sincerely adhered to. The practice of permitting movie actors, for example, to occupy a $5,000 suite

Captain H. Hartley, Commander S. S. *Leviathan*, with his executive staff.

for $500 was pernicious and unfair. It gave a chance to a snobbish group to become even more so at the expense of the taxpayers in the case of the American ships and at the expense of stockholders in the case of privately owned lines. It enabled them to four-flush—and the majority of them did it neatly and brilliantly.

The underlying excuse was advertising—but publicity of that sort was worthless, except to the actors themselves and their managers. Experienced travelers know how to do their choosing; inexperienced ones hardly would do their choosing by the movie-actor register; and the submerged world which has been taught to idolize screen stars is made up of persons that will not yield one paying passenger per thousand.

The *Leviathan* probably erred more than any other steamer in that fashion, hard put for advertising, and so was made the cynosure of attention that began with the ridiculously staged trial trip. The *Leviathan* has carried some real best passengers, but relatively few compared to other smart modern ships. Other lines, as already pointed out, offer complete service and therefore automatically draw the class that seeks best service, which one ship alone cannot render when at least three are required. Furthermore, business and social relations influence choice oftener than is imagined. The *Majestic, Olympic, Berengaria, Mauretania, Aquitania,* and other Atlantic liners of this class, are operated by companies whose officials represent prominence in business and social position in the larger cities of the United States.



S. S. LEVIATHAN.

Dinner.

Hors d'Oeuvres.

Crabmeat Cocktail — Bluepoint Oysters
Olives — Table Celery — Salted Almonds
Italian Antipasto — Dominoes de Paté-de-foie-gras — Smoked Sturgeon
Gherkins — Sardines in Oil

Soups

Clear Ox Tail Soup — Cream of Asparagus
Chicken Broth with Rice — Consommé in Cup (Cold)

Fish

Boiled Turbot, Butter Sauce or Sauce Cardinal
Fried Fillet of Sole, Sauce Tartare — Broiled Live Lobster, Caviar Butter

Entree

Aylesbury Duckling, Bigarade, Fried Sweet Potatoes
Noisettes of Lamb, Boulangere — Tournedos, Mascotte
Young Turkey, Braisé, Farmer Style
Heart of Palms, Sauce Hollandaise

Roast:

Roast Prime Ribs of Beef au Jus
Leg of Lamb, Mint Sauce

Vegetables:

Lima Beans — Creamed Cauliflower — Spinach
Green Peas — Stewed Corn with Paprika — Risotto
Potatoes: Boiled, Baked, French Fried, Parisienne and Fried Sweet.
Salad: Lettuce, French Dressing — Romaine — Combination
Compote — Peaches — Egg Plums

Dessert:

Soufflé d'Orange — Cocoanut Cake
French Vanilla and Tutti-Frutti Ice Cream
Biscuit Alhambra
Puff Paste — Souvaroffs
Assorted Cheese
Fruit in Season
Demi Tasse

Saturday, October 4, 1924

Typical menu for dinner on the S. S. *Leviathan.*

The *Leviathan's* list on my trip was fairly large, numerically, for the average ship, but almost invisible for so huge a vessel. The third class was virtually empty with accommodations for 1,880; the second likewise, with accommodations for 550, and the first boasted one passenger for every six places. The 150 passengers among our group made a poor showing in spite of the "papering" of the ship after the theater fashion of spreading people.

Traveling on the *Leviathan* seemed to have unduly enthused a gentleman past middle age who took it upon himself to become the leader or organizer of a "pro-American merchant marine" movement among passengers. Without dwelling upon the preliminary activities that occurred, he elected or appointed himself a sort of chairman during dance intermission the night of the arrival in Cherbourg. He expounded the benefits of an American merchant marine, the necessity of citizens to patronize it, and these perorations he punctuated with references to our ship. Some applause, some grimaces some stolidity.

Apart from the absurdity of exhorting enthusiasm with Americanisms based upon *the German-built Leviathan,* the propriety of conducting a "patriotic" symposium in the drawing room during social hour, with many foreigners present, is inevitably defective. Foreign passengers, who paid their fare and were present in the room for the purpose of playing bridge, or dancing, or otherwise passing time, should not have been made to suffer listening to flagful declamations, although they did it with little grumbling. The intent of the speaker was quite all right—but it was his place, on a public and of course cosmopolitan carrier, to announce a special meeting to which Americans *and others* who cared to be present were invited, and so forth.

No wonder that a responsible American on board—an important government employe—the next morning apologized to the British passengers on his acquaintance. It was, this, the nice thing to do.

On the *Republic,* returning from Europe, passengers were picked up in Germany, France, England and Ireland. Being a cabin-ship the social aspects were not so insistent. Occasionally persons with the social label—I mean the genuine one—do travel on these slow and plain boats, but the most ambitious affair always resembles an ordinary family affair. Swank is a sure road to unpopularity.

"Room and board" for about $5 per traveling day is sufficiently modest and practical a sum to attract, and it is my belief that the future paying bulk passenger traffic will consist of two major groups: the cabin group and the economy group, the latter to utilize, at not more than $5 a day, the former immigrant space.

The *Republic's* third class was fairly patronized, on our trip, the German taken on at Bremen being supplemented by Irish at Cork. Nothing was more amusing and at the same time indicative of what happened in the weather deck Sunday morning. The central hatch being the basis of a dividing line, the Germans congregated on one side and the Irish on the other. While the Germans, with an improvised mandolin chor, sang religious hymns, the Irish, ten feet away, with nothing but the air and sunshine between them, were dancing folk-dances to the tune of a small accordion.

Hardly a word was exchanged between members of one group and the other, although bodily proximity was inevitable. A bareheaded German, I remember, was peering over his glasses at the pirouetting children of Erin, and it was easy to perceive from his attitude, his demeanor, his gesture, that his explanation (Concluded on page 9)

U. S. S. *Republic.*

EDITORIALS

The President to the Cadets

EXCEPT when he is making those routine addresses intended for a race or organization avid of public praise, our President grows wiser and wiser; he expresses the American mind with increasing aptitude and accuracy. His address to the cadets graduated at Annapolis was a plain and yet profound exposition of what devolves upon him as President, upon them as officers, and upon all of us as citizens. As President it is his double duty to maintain at high efficiency the national defense and at the same time maintain international relations in such friendliness as that defense need not be used. He rightly says that no nation will ever be able to erect so overwhelming a defense as to render it wholly immune from attack by reason of the fear it inspires. That immunity can only be secured by the maintenance of right international relations. As President it is one side of his duty to try to maintain them. Peace does not come by fear but by faith, the faith of peoples and governments in the honorable intentions held one toward another.

Mr. Coolidge, whom none thought to be a literary man—as no one thought of Abraham Lincoln as a man of letters—is developing a singularly engaging form of public address. It is very easy for the man in the street to read. The President's thought is so thoroughly clear to himself that he is able to express it in simple English to his hearers and readers. He says what he has to say, and leaves it there. He does not rant. He does not wave the flag. He does not denounce or threaten or promise or seek for skyrocket eloquence. He uses no superlatives, few adjectives. All this is not only a gain in clarity, but it leaves room for his sincerity to become evident. The addresses he has been giving the country lately constitute important lessons in citizenship. They are of such character that schools and clubs and churches all over the country might well make place in their programs for the public reading of them again.

Movies for Air Passengers

NEWS comes from England that the directors of the Rolls-Royce Air Express of the Imperial Airways have fitted their machines with a motion picture projector, and that picture shows will, in the future, be given while the machine is in flight.

The projector has been installed in the luggage compartment at the rear of the passenger cabin, and the screen erected against the bulkhead which separates the passengers from the pilot's cockpit. Fourteen spectators can be accommodated in two rows of armchairs running down each side of the cabin, while for the benefit of all and sundry the star picture is to be advertised by big streamers on each side of the air express.

It is little more than fifteen years ago that Bleriot's fragile monoplane shot through the early mists of a June morning from the coast of France, for the first time in history carrying a man through the air across the Channel, and yet air travel is becoming so familiar that with the moving earth beneath them—a vast panorama of Ocean, Alps, Empires, Historic Cities, Lakes and Rivers—passengers must have their moving pictures aboard!

Or are they a device to prevent air-sickness?

Doctor Fosdick Lands in Roses

THE announcement that Doctor Harry Emerson Fosdick has been invited to the pastorate of the church of John D. Rockefeller, Jr., is no surprise to those who have been on the inside of the Fosdick controversy. The amazing feature of that disturbance is that the man about whom it centers is neither an original thinker nor a great preacher. The writer of this editorial was in New York the Sunday morning Fosdick preached his sermon, "Shall the Fundamentalists Win?" and sought in vain for the clues to the preacher's popularity. It appears now that the Fosdick publicity was cared for by the highly paid but more highly efficient publicity agent of the Rockefellers. It was not let to run haphazard as the spirit which bloweth where it will, it was rather skillfully directed. The same hand which so adroitly has changed public opinion toward Standard Oil had somewhat to do with directing it toward Mr. Fosdick.

When Plymouth Church, the old pulpit of Henry Ward Beecher, sought the services of Mr. Fosdick, they were not to be had. Yet there was a fitness in the call, for Plymouth has always been a free pulpit and Plymouth sadly needs rehabilitation of its fame. But Plymouth is not rich. And whether in his ministry down at the end of Fifth Avenue Mr. Fosdick formed the aristocratic habit is not known, but Plymouth did not get him.

Which rather shuts out Mr. Fosdick from the martyr's crown. He rejoices in the lesser term of heretic. Martyrs suffer and sacrifice for their cause. Heretics often find a greater reward than their abilities, regularly employed, would bring them.

Invited to Shut Up

IT IS greatly appreciated among those who try to keep informed about our larger affairs, that the government has at last expressed displeasure with unofficial ambassadors who presume to speak for the American people to foreign nations. We have often before inquired what right Otto H. Kahn, to take a conspicuous example, had to tell France that the United States would do this or would not do that. We have had to inquire by what right of congenial mentality or official designation he presumed to interpret the American mind. We have had to inquire if our foreign affairs were in the hands of international financiers who for the most part hail from foreign lands but are not even nationals of the lands they hail from.

Of course, to such inquiries of citizens governments make no reply. But at last something has occurred which resembles a reply. It has been announced with every show of authority but with no names visibly attached that the government earnestly invites certain gentlemen to shut up. We were in the beginning of negotiations with France when certain gentlemen told France that we did not mean what we said, that we would not perform what we purposed. These self-appointed spokesmen have been silent ever since. It is well.

Perhaps this peremptory action came about because now our State Department, which is our Foreign Office, is in the hands of men with experience of foreign affairs. For a long time our Secretaries of State have been inlanders who may have known parts of Europe as tourists, but who knew nothing of Europe by first-hand diplomatic contact. They meant well but they did not know. They were at the mercy of their department heads or their representatives abroad. Now, however, we have a Secretary of State who saw service abroad, who knows Europe from its center, who knows how asinine some so-called Americans can be when telling Europe what to do or when announcing what they think America is going to do.

If this interpretation of our new policy in foreign affairs, or rather our method of handling them, is correct, we have come to a time of dignified advance.

Orgy of Unproved Charges

WHO has not noticed the extreme disparity between charges made and charges proved, between arrests made and convictions secured, especially in the political life of the United States. In every part of the country there has been a perfect orgy of sensational charges and the arrest of men of position—a day's furor over each; and the next thing heard is a judge or jury saying there was nothing in it at all.

The dangerous frequency of these occurrences suggests that it has become a habit to play horse with the law, to use it as a bludgeon for private purposes, to utilize police power to affix a stigma which sober trial would be unable to do. We have seen Senators, Governors, City Officials, Business Men, Private Citizens of Note, men of every degree, hauled up on the demand of their political or personal enemies, only to be discharged in the end, and that without redress. They come out with their humiliation, with their American rights hanging in tatters about them, many of them having been compelled to taste the bitterness of American police brutality—which is the scandal of the police world—but they have no redress.

This is a situation which may easily lead to the most upsetting revolt of all—the revolt of the decent citizens of the land. Daily our comparison with England grows more glaring, because over there a policeman sees in every ragamuffin a British citizen with whose Rights he must deal circumspectly; and if that ragamuffin is arrested, the police authorities see in him a British citizen on whom they work no indignity, no more than the Roman officer dared work on the Roman Citizen, St. Paul. There is no *third degree* in England. There is no promiscuous hauling up of individuals. A police error over there is one of the most serious things that could occur. Yet they have *less crime*, and of what crime they have *less is undetected* and *less is unpunished* than any country in the world. And they don't shoot police officers.

While we are urging the study of the Constitution of the United States upon everybody in the country, it might be well for local authorities, and Federal, too, especially those having police power, to exemplify the Constitution in those clauses which define the Rights of Citizens, in their persons and estates.

It is not the Bolshevik this nation needs to fear, but the Citizen whose Rights are at the whim of local authority.

Dogmatic Bureaucrats

THE temper of the bureaucratic mind is almost perfectly illustrated in a story that comes well-authenticated from Spain. Two brothers set up in business in a bakeshop there and before opening presented a plan of their baking facilities, as required, for the approval of the city government. The clerk declared it could not be approved because there had been made no provision for a sleeping-place for the mule.

"But we have no mule," objected one of the brothers, "our kneading machine will be run by an electric motor."

"That makes no difference whatever," replied the clerk. "The ordinance requires that there be a stall for one."

MR. FORD'S PAGE

FOR a long time human progress was made in salients. Under the stimulus of curiosity or under the pressure of need, it thrust its angles of inquiry into the unknown, now at this point, now at that, until the whole line had moved a little forward.

At the first, probably, men just multiplied. That was all they could do, and for the purpose of progress it was the best they could do. Population is one of the requirements of progress. It is the pressure of people that moves the race out into new territory and brings into use its dormant faculties. It forced men to cross mountains and to explore the reaches of the sea.

Then came the various angles of activity which mankind thrust out into the world. They learned the wealth of the animal world as shepherds. When they planted the vine, its cultivation required them to cease their roving and settle down, whereby they learned the wealth of the soil. By degrees there came the knowledge of metals and herbs and a dim intelligence that beyond inert objects were powers unknown. These were all angles which the race thrust out, as an advancing army thrusts out a salient, feeling its way into unknown territory.

The story of man's intellectual life follows the same line. Religion was one of the earliest salients made toward the future. There was a time when it engrossed all of mankind's interest. It represented a corridor into the mystery of life. A masterful salient, it still maintains its significant thrust toward the unknown. Then came Philosophy, a determined angle toward hidden knowledge, by which men sought to explain the origin and the purpose of all things under the form of one coherent system. It is a salient that has never been abandoned. Following this came Law and Politics which sought to encompass the laws of how men might live together under terms which approximate justice, how the community might be reared on foundations that would be self-sustaining and endure, and how families of peoples might be enabled to work out their manifest destiny. Last of all came Science which is not one salient but a whole line of salients that overlap and complete all that went before, thrusting into earth and sea and sky, into mind and matter, into past and future, into spirit and substance, holding nothing immune from its universal inquiry.

At each period one of these interests was dominant. The passing dominance of each was bewailed as the downfall of the world. As the directive energy of life has established one salient and then left it to establish another, there have always been those to pronounce the word of doom. Men are saying it now about the heavy toll of mental energy which Science is drawing to its service.

What it all means is this: mankind until now has been making preparations—it is now ready to advance along the entire front. Formerly men said it this way: "This is an age of specialists." It is more than that. It is an age of every specialty, and every specialty merging into a unified whole. Mankind is advancing along the whole line. The march for which humanity was organized has begun. Previous races on this earth, many believe, have taken up the same march and lost themselves. It now remains to be seen what the Race of Man will do.

THE present progress means that, after making partial advance here and there, mankind is now moving along the whole front. In former ages men's minds had only one or another dominant channel in which to move. Now all channels are open, and so full is the stream of life that all of them have flowed together. No new revelation has come, no new spurt of power; all that was learned bit by bit, generation by generation, is now enlisted in the common service, and the force of it is irresistible. To know this is to interpret the place of this generation in the schedule of human progress.

The details that were mastered one by one, the knowledge painfully achieved here and there and bit by bit, the experience gained and passed on generation after generation, has now headed up in a unified whole which enables mass action on a scale wholly unguessed even fifteen years ago.

A man's first duty is to know this. He who lives in a daze through his own times, unable to place them in the schedule of Time, unable to interpret their meaning to the race, is not living at all. Half the distress of the people is due to the poverty of the *meaning* given to this phase of human experience. To live is more than to make a living. The program of progress has the whole race in view, yet it moves forward by each man making his own living through lending himself to the general plan; yet if all he gets out of it is his living, he is like a man who goes on cleaning out the gutter while the king's pageant sweeps by. More than half of life is to know the times in which we live.

Shortsighted men think that progress is only a better opportunity to make money. But there are men of vision now in action, and more men of better vision coming up with the younger generation, who will keep the lines straight. Every army has its sutlers; but it is only the soldier that bears away the honor. Sutlers get but profits.

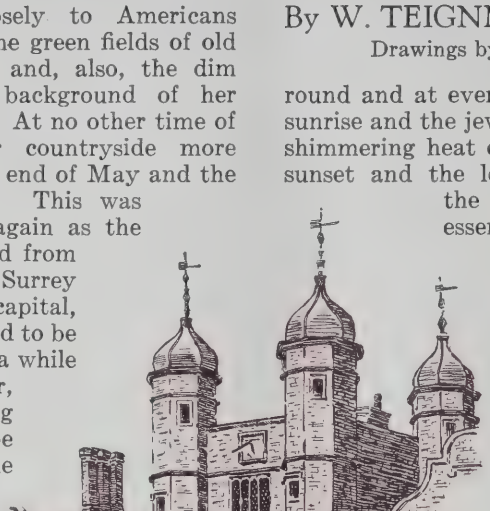
Where Past and Present Meet

Pilgrimage to Guildford, Surrey, the Quaintest of Quaint Old Towns

By W. TEIGNMOUTH SHORE

Drawings by L. Pern Bird.

VERY closely to Americans appeal the green fields of old England and, also, the dim historic background of her country-town life. At no other time of the year is our countryside more lovely than at the end of May and the opening of June. This was borne in on me again as the other day I jogged from London through Surrey to the county capital, Guildford. I longed to be a countryman for a while at any rate; or, better, a discerning country lad; to be able to roam the vivid green fields, to sit beside a murmuring brook, to lie beneath the trees in the bosky woods, to clamber in the tall hedgerows. These last we are told by the money-minded are waste of good land, which might be turned to the cultivation of foodstuffs! Nonsense! Down with such pedantry! Up with the hedges of England! Adorned with a splendor of May blossom; milk-white, sweet-scented. Called sometimes "Ladies Meat," and what more dainty to set before a lady fair? Alas! soon the ground is whitened with the falling bloom; "Perfection is the beginning of decay." Later the hedges will be bedecked with the loveliest of all English wild flowers, the Dog rose, delicate pink and white; the Tudor rose; Shakespeare's rose. Then the honeysuckle, with its sugared perfume.



Gateway of Abbot hospital.

The fields and meadows! Vivid green carpets of grass, which, as Walt Whitman says, surely is

". . . the handkerchief of the Lord,
A scented gift and remembrance,
designedly dropt."

Save in the Emerald Isle, there is no grass so green as that of England; just the common grass of the fields; there is little that can compare with it in America. Such grass grows only in the damp climate of comparatively small islands, where the sea winds bring plentiful rain and moisture. I believe that the clear complexions of Irish and English girls are to be credited to the soft climate; a great credit.

The fields of England! Guarded by high luxuriant hedges and by tall, shadeful trees; lovely all the year round and at every hour of the day—sunrise and the jeweled dew; noonday's shimmering heat or cloud-shed coolth; sunset and the lengthening shadows; the basis of this beauty, essential to it, the tender green carpet of grass, sweet and fresh.

And, over there, on the low hillside, a joyous outburst of gold! The golden gorse, which blooms all the year round, giving us the pleasant old saying that "when the gorse is out of bloom kissing's out of favor!" Another golden flower that decorates waste land is the dandelion, so handsome that it can laugh at being called a weed! Friend and lover of the sun, whom it worships by day, sorrowfully hiding its face in its green fingers by night.

The High street, Guildford.

"The flowery May, who from her
green lap throws
The yellow cowslip and the pale
primrose,"

says Milton, who was not a too austere Puritan. The primroses, nestling under the hedgerows, have gone and the golden cowslips are beginning to hold up their heads. Look at that meadow, studded with buttercups; that field starred with daisies—the eyes of the day.

Come in May and June, you welcome visitors from far away; walk the fields and you will learn the re... why we who dwell in England love h...

Leaving main lines, the railr... of England afford much entertainm... and surprise to American trave... notably the rustic charm of many v... side stations, shaded by trees and j... with flowers, veritably part of ... countryside. and new, of yesterday and today. you cannot draw a line at which past ends and the present begins, therein to many is the charm, the , of such towns as this. The boys Guildford, many of them, go to the grammar school; the *old* town hall till busy; in the *old* hospital worthy and women pass in peace their er days. All as their fathers did re. I feel dead in a town that is dusty with centuries gone; I am e and alert in such places as this re ghosts run busily and happily ut the streets and in and out of houses which they frequented and ch are now noisy with the doings, gs, comings of today.

There is the gray, weather-beaten, e front of the Royal Free Grammar ool; typical amalgam of past and ent. We pass in through a massive en door, with a wicket gate, with e iron knocker, great bolts and derous hinges into a tiny court- d. It is old, old! Founded as long as the early year of the sixteenth tury; aided and abetted later by vard VI who was munificent to so y schools where they taught and teach Latin and Greek grammar. se present buildings were begun in bout 1557. It all bears the odor ntiquity. Look at the heavy beams t carry the floors and ceilings; them are the names of long-gone lars; 1614, 1619, 1641, and so on! re in the lower schoolroom, now dark to be used for lessons, are ed about the clothes of the boys today who are off to the cricket d. Which day are *we* living in? lay or yesterday? It is not easy determine. Upstairs, the library; vy, musty, dusty volumes, no less n eighty-five of them chained se- ely to their shelves! Of old, books e too valuable to be let loose to n at their own sweet will!

Before we leave the school, let us as we read in Statute XVIII at every scholar of the sayd school ll pay eightpence yearly toward provision of oms and rodds e used in the d school"; you I remember- from the days ur boyhood to at *base* uses se "rodds" e to be put! 'My affection ding me," ote George oot, "to the n of Guild- d, where I was n, and where aged parents d many years h good report, hought upon erection of a spital there, ich I have dedicated to the blessed Trinity." Who was this George, who loved Guildford and of whom his native place is still proud? He was born in 1562; died in 1633; was educated at the Free Grammar School which we have just left; became a learned and strenuous divine; helped in the making of the Authorized Version of the New Testament; was in succession Bishop of Coventry and Lichfield; of London; and then Archbishop of Canterbury and Primate of All England; a Puritan yet a "sportsman"; a great, worthy and honest gentleman. What was this —no, what *is*—this hospital the erection and endowment of which was at his charge? Let us cross the road; go in to see. We pause to look up at the stately, red-brick gate-tower, with its four picturesque turrets; at the back of us the traffic of busy today; then we pass in through the fine archway into an abode of ancient peace. In the seemly rooms around the flower-decked courtyard dwell twelve brethren and ten sisters, poor folk and worthy the boon of peace and security for as long as life lasts them. We walk round with one of the brothers; he is proud of the beauty of his home. He takes us into the common hall; paneled walls; huge open hearth, beside which stands the big pot in which in former days the common meal was cooked; high-backed settle, so that you may sit near the fire and feel not the cold draught stiffening your back; heavy, massive tables, benches and stools, black with age; red-tiled floor; huge-locked door. We have journeyed back farther than yesterday! A peep into the roomy kitchen; into the vegetable garden at the back, wherein is a quaint garden-house. Then into the small chapel, magnificent only in the glorious beauty of its two great painted windows. No one knows for sure whence they came or by whose hands they were designed; but what matters that as long as they *are* there? The story told in gorgeous coloring is that of Jacob. And, mercy on me, when I see the very solid ladder up which the angels are descending and ascending, there comes back to me the question asked by a small child: "Please, if the angels had wings what did they want a ladder for?"

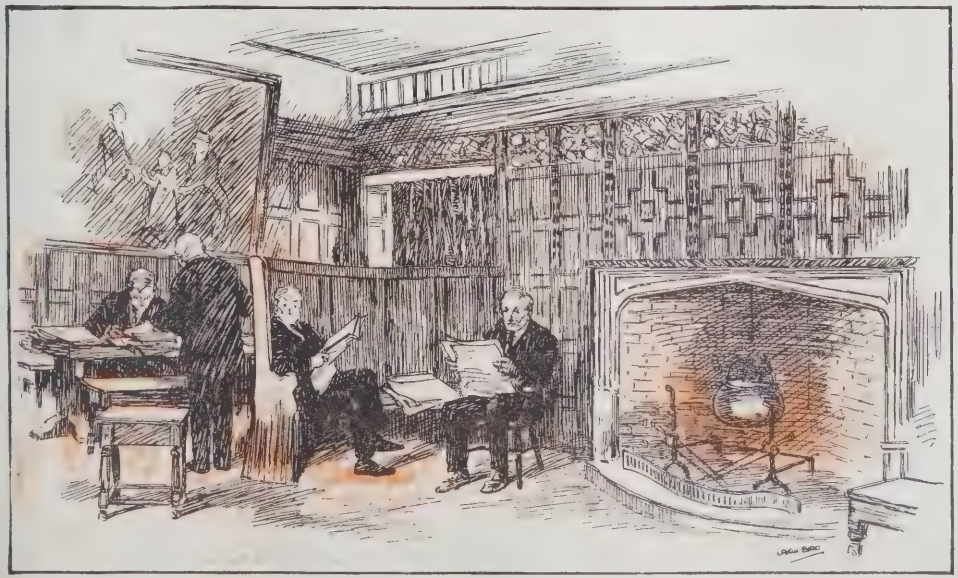
Each brother and sister has a living room, rent free; the use of the common room and the garden, and so on; the free services of doctor and nurses; free lights and coal; and eight shillings a week in cash and an equal share in the contents of the visitors' box.

Opposite the Hospital of the Holy Trinity is Holy Trinity Church, a modern red-brick building that has replaced one far older—we go therein only because there rest George Abbot, Archbishop of Canterbury; also Maurice Abbot, his father, and Alice Abbot, his mother, whom death did not part, for they left this world the one a few days after the other.

A few yards down the street, the Town Hall, which hangs out a big clock, bearing the date 1683. This business place of the corporation; of the corporate body of the citizens or burgesses of Guildford, who there transact their affairs through their elected mayor and aldermen. The court room, where justice in minor matters is dispensed; the council chamber where the governing of the town is discussed and ordered. Here hang contemporary portraits of Charles II; James II; William and Mary; here are ancient standard measures: pints, pecks, bushels, quarts, and so on, each bearing the initials E. R., Elizabeth Regina, by the Grace of God Queen of England, France and Ireland! In the council chamber is displayed a list of the mayors of Guildford from the year 1362 to the present wearer of the mayoral robes.

Here am I, of today, all compact, rambling through a town of which mention is made in the will of King Alfred the Great! A pilgrim of today in streets that have been thronged by pilgrims on their way from the west of England to the shrine of Saint Thomas in Canterbury Cathedral! Indeed, a town with a story and a history to tell! A town of old churches, old hotels, old homes and new; a beautiful town set in a beautiful countryside; a mingling of yesterday and today. Medievalism and modernity walking and talking hand in hand; new lamps and old burning side by side, with pleasing promise for tomorrow.

Hail, and fare thee well!



The common room, Abbot's hospital.

The Frenchman as a Tax-Dodge

The Government in Past Has Borrowed From Him But Must Now Tax Him

By PHILIP CARR

THE French financial problem is largely a taxation problem, and it is a problem which, if it has been aggravated by the circumstances and results of the war, dates further back. The population of France, on the whole, is not poor. No Frenchman wastes money. Every Frenchman saves part of his income, however modest that income may be, and, as it has been said recently by a highly qualified British observer, France would be the richest country in Europe today, if the French had not been tempted, again and again, to lose in dangerous investments abroad the money which, with such admirable thrift, they have so carefully economized at home. The fact that the French peasant always has savings to invest has partly led to the bad financial policy, which his governments have followed for many years. They borrow from him rather than tax him.

The Peasant Must Be Made to Pay Up

The moment has now come when the borrowings must cease and the peasant must be made to pay; and the members of the government have to deal with the uncomfortable fact that instead of educating him for generations to be a taxpayer, their predecessors have constantly flattered his belief not only by borrowing from him instead of taxing him, but by raising the greater part of such taxes as they did impose in an indirect rather than a direct form, and so making him pay almost without knowing it.

That the government must somehow find the courage to bring borrowings to an end and must enforce heavy taxation is generally admitted by French economists. As one of these, M. Gaston Jeze, wrote the other day, "the time has come when the liability can no longer be passed on, as it has so often in the past, to a succeeding generation. This generation must bear the burden. There is nothing but a determination not to pay in the phrase, so often heard, 'I have no wish to evade my taxes, but I object to these inquisitorial methods.' "

The truth is that it takes many years to educate the taxpayers of a country into submitting to direct taxation and the tax collectors of a country into getting it in. This education, in Great Britain, for instance, has extended over several generations, and if the income tax works satisfactorily and smoothly, it is because Englishmen have been accustomed to it for so many years. In France the income tax was first introduced by M. Caillaux, and it is for that, more than anything else, that he has never been forgiven by the property-owning classes. The law which created it was passed in July, 1914, and the tax was first collected no longer ago than 1916. Since that time the average Frenchman has continued bitterly to resent both the declaration of his income and the steps taken by the authorities to discover what it is. Public opinion has certainly been in favor of evasion, and M. Loucheur's famous phrase describing the income tax as *"l'impot des poires"* or the "Mugs' tax" has represented not only the feeling of the country but the successful expression of that feeling as shown by results. Although the limit of exemption is no higher than 7,000 francs or $365 a year, only 927,000 persons paid income tax in 1923, out of the total population of 39,200,000, and it produced no more than 1,300,000,000 francs in all. It will be seen that there is a considerable margin of probably undeclared and untaxed income.

The center of the whole situation is that France remains mainly an agricultural country. The ironworks of the east, the cloth mills of the north, the silk looms of Lyons and the general manufacturers of Rouen and the lower Seine valley get themselves talked about, but in reality they represent a comparatively small part of the wealth of the nation, which resides in the wine of the south and in agriculture everywhere. Outside of Paris, there are only seven towns which would rank as towns of any importance in the United States, all the others are little more than market centers for agricultural districts. The rich man of France is only moderately rich, but there are many of him, and he is a peasant.

Difficulties in Direct Taxation

From this, several results arise. As the peasant is not only the rich man but the politically powerful man, he tends to throw off the burden of taxation on the inhabitants of such towns as there are. There is little doubt that the townsman is taxed about as heavily as he can bear. There is equally little doubt—and no well-informed and sincere Frenchman will deny it—that the peasant not only pays relatively less than his fair share, but gets off very lightly in an absolute sense. The difficulty is to discover how he is to be made to pay. He is naturally secretive, and even when he does not actually hoard he generally manages to conceal his investments.

To combat this elusiveness habit has gradually been formed building up systems of indirect ta tion from which the peasant can entirely escape. It can hardly be tended that the state manufacture tobacco and matches is economic sound, and its yield is probably than if a tax were levied on priv manufacture of the same products; it does get some taxation from peasant in a form which he has gro accustomed to accept. The sa difficulty in taxing the peasant dire is accountable for the survival, local taxation, of the *octroi* or tax all the consumable produce enterin town. It is a wasteful tax. It is ve tious and disturbing to trade. cost of collection is never less t 10 per cent and sometimes as muc 18 per cent of the gross receipts. the *octroi* remains the chief source the local revenue of most of the to of France.

There Are Many Job-Hunters

It enables t to tax the peas of the surrounc country.

There is another reason for difficulty in suppressing such inst tions as the *octroi* and the tobacco matches manufactures. They h each created a sort of vested inte which it is very difficult to dislo In the administration of both there large number of modestly paid but exacting jobs, and there are m persons in France who are on the l out for jobs of this kind, just as t are deputies and other public men would not willingly sacrifice the pat age of allotting them. By long tradi the *bureau de tabac*, or retail governm shops for the sale of tobacco and p age stamps, are given to the wid of army officers, who do not sit at counter themselves, but farm appointments at a profit. There similar perquisites all through administrations, and it will be seen there is therefore a considerable f of resistance against their abolition.

Much the same force of resistan opposed to all attempts to intro increased efficiency, economy of organization and especially reductio personnel into the government ser There are many Frenchmen of mo ambitions, regular habits and si tastes, who ask no better than career of a *"fonctionnaire,"* where pay is small, but the work is not h and the hours are not long, while t is a comfortable little pension at end.

In 1922 M. Bokanowski, the porteur General of the Budget C mission of the Chamber, presente

ort showing the number of governnt employes in that year. The total s 690,938 and their salaries were 18 millions of francs, showing an erage annual salary of 6,684 francs r employe, or not quite $350. In dition to this there are the *octroi* ic als (town tax collectors) who numr 2,667 for Paris alone and 3,184 for e ten towns next in size. They may estimated at 15,000 at least for the ole of France, thus bringing the nd total of officials, without inding the municipal employes other an those of the *octroi*, up to 706,000.

It cannot be said that any of these icials are overpaid. Indeed, every rson who draws a salary in France underpaid, whether he draws it m a private employer or from the te. It is very little known in the ited States how small are the salaries ached to quite important positions France. These salaries were small ough even when the world value of e franc stood where it did before the r and they are smaller still today. may be worth while to take a few ncrete examples. The highest pernent official employed by the city Paris gets 35,600 francs a year all d, or $1,860. He got rather less n half that amount in France before e war. Its chief engineer gets 28,600 ncs, and many responsible profesnal appointments, such as those of emists, are not worth more than ,600 francs or just over $600 a year, ile that figure is well above the erage in the administrative and rical services. It will be remembered t the average salary of all state ployes taken together is only equal $350. In all other forms of public ployment it will be found that the ms are no bigger and the average is out the same. In the army a marshal France gets under 38,000 francs or t quite $2,000, a lieutenant colonel paid 16,200 and a captain of long vice, about 12,000. Judicial apintments are no better. The salary the highest in France is no more than 000, presidents of other courts, 000, justices of the peace, 12,000, d *Juges d'Instruction*, or examining gistrates, 12,600. The Prefect of lice of Paris has no more than 40,000, ile even an ambassador, who is en a high salary because his exnses are heavy, is limited to 58,000.

To understand these things about ance, as to understand most other ngs about her, it must be remembered t although in logical clarity, in neral education and in artistic sensiveness she has the most cultivated nd in Europe, in practical affairs her nd remains that of the peasant state a highly organized and administrately centralized peasant state, no ubt, but still a peasant state. That is y her sons will fight and die for the l, why they are highly individual, y they are secretive, why they live ple lives, why they save money and y they hate paying it.

The Closed Gentian

Where the Bumblebee Unlocks the Dining Room of Azure Blue

By D. LANGE

SOME of our wild flowers are more suggestive of poetry and romance than others. The golden clumps of marsh marigolds, the wild roses, the sky-blue gentians, they all quickly stir the poetic instinct. Unfortunately our very first spring flower, the skunk cabbage, will bloom unsung as long as it is burdened with its present ultra-prosaic name.

All the members of the gentian family possess a strong poetic appeal. They are not too common, they do not attain to the size of coarse weeds, nor are they too minute. They do not keep company with the flora plebeians of the roadside; they blossom late in the season, when the sweet melancholy of autumn pervades the atmosphere. They do not obtrude themselves along the highways, but must be sought for along the dim trails of marsh and meadow, where boys and the small wild folk love to ramble. And in addition to all these appealing qualities nature has painted them with her purest sky-blue, a color not too common among her floral children.

The closed gentian.

Poets love the forget-me-not, the speedwell and the bluebell, but the gentian is acknowledged the universal favorite.

The structure of the closed gentian was long a puzzle to me. Its striking azure blue certainly, by all the laws of the flower world, invites insect visitors. Where it grows in tall grass on the edge of a marsh, the flowers are of the purest blue and the stems more than two feet tall, as if the plant were making a special effort to display itself in the rank grass. And then in the face of all these alluring invitations to its guests, each blue dining room is carefully locked by a special device, which, so it seemed to me, it would take a strong insect to open. It took some care on my part to open with the point of a pencil the corolla, which was securely closed by the petals being twisted and folded like the well-known rubber tobacco pouches.

But one day I witnessed the miracle. A big bumblebee alighted on the top of the flower. He first probed the blue cup with his long proboscis. Then he stood on his head and literally pulled and kicked himself in and remained inverted for about half a minute.

Thus I learned to understand the mystery. The closed gentian does not make a general bid for any and all insects as do the members of the carrot and parsnip family. It issues a limited invitation to bumblebees only, for they alone know the secret of the gentian lock, and have the strength to open it.

And I learned another strange thing about this plant. It does also produce some open flowers, which are smaller and grow lower down on the stem. These flowers constitute a kind of insurance policy against the failure of bumblebee visits; but what insects visit these smaller flowers, I do not know.

The gentians in the low grassy meadow grow unusually long, slender stems, and when I transplanted them to my garden, they still produced a very tall stem.

I fancy that these gentians have grown in competition with the tall grasses for several thousand years. The ground on which I find them every autumn has never been under plow and has never been a hay meadow. It has been a free-for-all area ever since the continental glacier melted away, and it looks to me as if these gentians had developed here a special long-stemmed subspecies; for gentians growing on more open ground have shorter stems and no open flowers.

Some clumps of closed gentians produce flowers that are snow-white.

Clumps of the two shades form a beautiful contrast, like banks of fleecy clouds floating on the surface of a summer sky.

American Humor No Laughing Matter

A Faculty for Fun Has Made Many Writers Feel Like Frankenstein

By THOMAS L. MASSON
ILLUSTRATIONS BY WILLIAM O. FITZGERALD

ONE of the most curious mysteries of current American literature is the widespread illusion that humor is popular. With rare exceptions, which can easily be accounted for on other grounds, books of humor are never best sellers. Most of them, when read continuously, are flatter than a pancake. Indeed, nobody would expect to read a humorous book through, unless the humor in it was subordinate to the story interest.

Our daily conversations all over the country—listen where you like—are almost totally devoid of humor. In history, where men have been noted as great wits, they have generally been shunned and largely despised. Whistler was such a man. Oscar Wilde, of whom it has been recorded that he wrote down his remarks before each day going out, was another. I know several otherwise delightful and nearly famous men of the present day, who are similarly handicapped. One of our most notable Congressmen of the past—Sunset Cox—declared in so many words that his career had been badly damaged by his reputation for being a humorist. Mark Twain was afraid to publish his serious "Joan of Arc" over his own name because of his reputation.

Humorous writers who come to achieve any kind of distinction are quick to discover this fact, and, after the first fatal shock of the discovery, usually try to pull themselves together and struggle out of their reputations. Both Peter Dunne and George Ade, at one time two of our best humorists, are instances of this. Peter Dunne, who created Mr. Dooley, sold, as I recall it, one hundred thousand copies of one of his books in about six months—and since then has been trying to write something else, with no success. Recently he revived Mr. Dooley in syndicate garb, but the public apparently was not interested. George Ade did better, in that he was able to write a few comic operas, which brought him a handsome fortune. But he is still running on his fables, and, while they are well enough as the world goes, it is doubtful whether they would be considered if it were not for his reputation.

At present probably the most superficially popular humorist in America is Will Rogers. With a very thin literary background, he is able to catch the public because his talents—which are very considerable—have been groomed by his dramatic experience. He came after the war, since which, as we all know, there has been a general let-down in standards, but no let-up in ribaldry, and he practiced on his audiences and found they could not be shocked by his wholesome truths. I hasten to state that Will Rogers is thoroughly clean; almost everything he says is true enough; that is why it is shocking, and why so many like it in the form he puts it. He is making money hand-over-fist, and let us hope is salting it away, for he will pass rapidly. They always do. The American public, however, is always generous with anyone of its favorites. It not only overplays him at his zenith, but lets him linger long enough afterward to eke out a tolerable living. Don Marquis, in some respects our best humorist, now takes advantage of this most tolerant age, and, side by side with his "Old Soak," publishes "The Dark Hour," a play in which Christ is the supreme figure, although, as Mr. Marquis explains, it would be bad art to place divinity actually on the stage. Don Marquis reveals the fact that the greatest humor is close allied with true tragedy. His de religious sense, united with a drama capacity for contrast, enables him produce a gallery of astonishing mir characters, not the least amusing which is Archy the Cockroach.

This process I have indicated, struggling out of one's reputation humor into more durable things, is o which, on the whole, appears to more successful in England than America. I know of no professio humorists there who are like the bra we produce here. Thackeray start as a humorist on *Punch*. Since time, *Punch* has nursed a line humorists, all of whom have o grown their original environment. C temporaneously, I can mention A. Milne, E. V. Lucas, and A. P. Herbe all *Punch* men, and all of whom more notable as poets, playwrights authors, although each one of th still sticks to his nurse.

In this country perhaps the m notable success in transition from original environment is Irvin Co although he has always been our b story-teller. It may be said, inde that his reputation as a humorist ca after he had made it as a story writ While there are any number of obsc humorists who write for local pap and have local reputations for bei "funny," the number of our humorists, who are just funny m and nothing else, is very limit Ring Lardner seems to be one, althou he has shown u doubted talent as story writer. S Hellman is anoth Don Herold, who recently produced very humorous bo is still a third, he unites an artis with a literary abili I suppose that Don Ogden Stewart wo be considered a four A much simpler w however, of mak my distinctions pl is to give a list our most distinguish humorists which reveal, in each stance, what their rious talents are compared with th humor. I make apologies for this, it is now highly fa ionable to give lists the ten best of a thing and everythi With rare except I know the humori

Nobody is to blame. We are merely victims of a mistaken civilization.

I personally, and in many instances ublished either their first work or that hich came after. This is of no special nsequence, except as a basis for the ader to judge of my competence. place the names in the order of merit hile at the same time the reader will e able to judge for himself of this der by the brief descriptions which llow of the works produced.

Harry Leon Wilson: I first knew r. Wilson as the editor of *Puck*, rhaps a quarter of a century ago. is "Bunker Bean," "Ruggles of Red ap," and more recently his "Ma ttingill" stories and his "Merton of e Movies," place him at the head of r creative character artists and tirists. He has never attempted (with ght exceptions, or perhaps I should y in minor ways) to write as a ofessional humorist. His books have ver been best sellers, but their per-nent qualities are uniformly rec-nized by the best critics.

Don Marquis: Mr. Marquis has en successful as a columnist, a poet, dramatist, and a humorist of re-rkable qualities. His work is uneven, d I think the fact that he has tied nself for so many years to the daily nd of a column has handicapped n. His flashes of humor are in-ative of the highest genius. Some is humorous poems are as well done anything in English humorous se. Perhaps no writer among us has h a wide range.

Irvin Cobb: Mr. Cobb as a humorist l Mr. Cobb as a writer of stories, I have indicated, two different ings. As a humor-s he has followed American tradi-ns in using his per-cality as foil. Thus belongs in the line f Artemus Ward, B. Nye, and Mark ain, his "Speak-n of Operations" ng perhaps the t example of per-cality humor. I y say that this ens to be peculiar o Americans.

Nobody wants to house a witty person for the week-end.

Montague Glass: Wh the exception f Peter Dunne's Mr. Dooley and Mark Twain's Tom Saw-er and Huck Finn, M. Glass seems to be the only American writer who has reated, in Potash and Perlmutter, w characters who are destined to ive. This is a remarkable achievement. He was also able to do a great service o the Jews, because he linked Potash nd Perlmutter up with human beings; hat is to say, he made the human side of Jews not only tolerable, but ex-remely amusing. Before he wrote of hem, Jew drummers were the nearest approach to characterization, and, as many of us still remember, they were hideously vulgar. Mr. Glass' contribution is therefore a very great one.

Peter Dunne: Unfortunately, Mr. Dunne has never succeeded in creating any character except Mr. Dooley, who now seems rather *passe* in a crowd of new sensations and shocks. In his day, however, Mr. Dooley had an enormous influence on contemporary thought. Many of his observations have sunk into the national consciousness.

George Ade: Mr. Ade was undoubtedly the precurser of Ring Lardner and Sam Hellman, not to mention others. He is responsible for the doubtful merit of inaugurating an era of such slang as the world has never before seen nor heard, and let us hope never will again. Furthermore, he has lived to see the terrible results—an almost hopeless mixture of bad grammar, united with a diabolical skill in word juggling. What I have so long hoped to see was George Ade so repentant of his former sins as to produce in his maturity a real work of humorous art, unstained with verbal abnormalities. In justice to him, however, it must be remembered that in his fables he was able to hit off certain strata of American life, to reveal it, as it probably could not have been revealed in any other way. In doing this, he came closer to the soil than any other American humorist of his day, with the possible exception of Ring Lardner. It is a pity that Mr. Ade in his maturity and independence, with time to reflect upon our national weaknesses, has not been able to reach any further height of true satire; certainly he cannot be classed with Harry Leon Wilson. But this is not his fault. Limitations of this sort seem to be inevitable among us.

Ring Lardner: Ring Lardner is a perfect example of the conventional development of the genuine American humorist. He came from the Middle West belt (Michigan) and got his apprenticeship (like George Ade, Theodore Dreiser, Peter Dunne, Eugene Field, and others) as a reporter. Thus drifting about, he absorbed the vernacular, this giving him the raw material upon which to exercise his great creative talent. The difficulty with him, as with all other "popular" humorists, lies in the fact that the very essence of humor depends upon its rarity, for surprise is essential. Practically all the humorists I know are in the same boat; they complain constantly of lack of ideas. Thus new fads are eagerly seized upon and rapidly run into the ground; as, for example, in the near past, Mah Jongg and cross-word puzzles. Fortunately for Mr. Lardner, he has constructive ability, and some of the characters he has drawn in fiction are evidence of first-rate talent. But the economic pressure is too great for him, as for the majority who succeed. He writes too much and too poorly.

He has already passed through the experiences of a lifetime.

Wallace Irwin: Mr. Irwin is another example of a man who started out as a humorist, but who, by desperate efforts, lifted himself out of his traces and developed into a story writer. He almost, but not quite, succeeded in creating a permanent humorous character in his Japanese Togo—still going on.

Will Rogers: Mr. Rogers shows the great advantage of real insight, backed by the kind of assurance which is not due so much to courage as to practice in facing audiences. He *personalizes* —if such a word is permissible—the kind of things which small-town country editors print in epigrams—shrewd, acid comment on our institutions. All this is very valuable, as indeed, national humor is valuable, not only because it acts as a constant corrective, but because humorists, by springing new surprises, influence very largely the serious writers; who, when they have anything really important to say, know that if they can get into it something in the way of humor, strengthen it by so much. All sudden and penetrative people like Will Rogers are therefore important; they are generally worth to us what we pay them.

Sam Hellman: Mr. Hellman, like Wagner's music, is a great deal better than he sounds. I believe he was formerly in the advertising business, somewhere in St. Louis. His work was picked out of the mail by an acute editor. Beneath the iridescent surface of his accomplished slang lie deep philosophical undertones. It does seem too bad that men like him and Lardner and Ade should be fixed forever in the frankenstein vocabulary they have invented as a kind of prison house from which there is no escape. The plain English language, as a medium of expression, has been going on for some time. Quite a number of first-class people—as chronology shows us—have employed it with good results. It must also be confessed that the best humorists in the world have never strayed beyond the confines of ordinary words. The characters of Dickens naturally express themselves in their own idiom, but when he describes anything—as that pony, or that fat boy or what Mr. Pickwick does—he does it in plain English. When we turn from these American slang manufacturers to those humorists, like Mark Twain, or Harry Leon Wilson, or even Bill Nye, and on the other side of the water, like A. A. Milne, Bernard Shaw, Jerome, Barrie, and Max Beerbohm—the drop is painful. It seems almost too simple to live on such plain food.

The Rise of the College Humorist

We are now in a state of rapid literary transition, and it must be remembered that a proportion of the humorists I have already mentioned, *as humorists*, are passing or have passed, and that others among us now writing may easily in the near future prove better than any who have gone before. Then again, there is a new and very extraordinary movement going on, quite significant, and that is the rise of the college humorist. Every university now not only has its humorous paper, but a large proportion of preparatory schools likewise. These papers are astonishing, not only in their audacity, but in their wit. Of course, due allowance must be made for the crudities of youth, for certain deplorable tendencies. There are now more than eighty college papers being issued in this country, illustrated and edited by young men under twenty, filled with such an array of flippancies, of flashes of brilliance, which afford the most interesting study in national psychology I know of anywhere. If anyone really wants to know what is the matter with the younger generation (if anything is!) let him read these papers. They have much more keen wit in them than we see in the columns prepared by the jaded and commercialized experts.

That is the other way that the humorist starts, aside from the way I have mentioned, of grubbing around on newspapers *a la Lardner, Dreiser*, et cetera. His parents, who either have money or make sacrifices, send him to a preparatory school and from thence to a university. Here he falls in with the college gang, so well limned by F. Scott Fitzgerald in his "This Side of Paradise" (Princeton) or in Percy Marks' "The Plastic Age." He survives this and pants to become an author. He has already passed through all the experiences which any human being has in an ordinary lifetime. Love in all its phases is an old story.

Ambitious to Be Securely Syndicated

All of his emotions have been so massaged that there is nothing else for him to think. In this condition he is thrown on an indifferent world, and from the embryo that he is, suddenly falls with a dull thud to the realization that he must support himself. Some few years ago I had occasion to interview a host of these young men, just out of colleges, each looking for a job. Their hidden despair, the sudden looming up in front of them of that grim specter of modern psychology, the inferiority complex (without which no humorist can now do his best work), all this is highly pathetic. Many of these young men fall by the wayside and wind up by becoming bond salesmen, an easy form of character evasion. But every once in a while one of them gets his pieces into the humorous papers; he is hailed as a newcomer in the inner circles; the kindly critics, who have arrived, hasten to boost him. Thus by a queer combination of genuine talent and logrolling, he gradually works his way up. The ultimate end of his ambitions is to be like Ring Lardner, securely syndicated, whose poorest work is graciously paid for at all the way from twenty cents a word up.

Nobody is to blame. We are merely victims of a mistaken civilization.

As I have indicated, there are, in addition to those mentioned, about forty other humorous writers in this country who furnish us with our daily dozen of bright things. Humor, of course, has its main divisions, and its by-products. In some cases the humorist trots out his personality into the main circus ring as a clown trots. In others, he creates stories with humorous effects, through his characters.

Some Parodies and Also Burlesques

In a large number of cases he uses burlesque, which, during the past few years, has become extremely "popular." Thus two writers among us have developed well-deserved reputations. Donald Ogden Stewart, who came out of the Middle West, has held up to scorn certain American types in his "Parody Outline of History" and more recently in his "Mr. and Mrs. Haddock Abroad," both highly amusing, and fine examples of burlesque-satire.

George Chappell, who in private life is an architect, succeeded in creating and "putting over" a trick character in his Dr. Traprock, his "Cruise of the Kawa," being a fine satire on th South Sea literature, followed closel by other books on other subjects, distinct falling off from the first.

Another satirist who, if more supe ficial, is on the whole more thoroughl entertaining, is Robert Benchley, who spoken stage monologs are maste pieces of foolery, and who has occasio ally produced a genuine piece humorous art.

Among still others certainly shou be mentioned Clarence Day, Jr., who "Simian World" has never receiv the recognition it deserves; Christ pher Ward, who has finely burlesqu some of our most notable novelist Dick Wick Hall, whose Salome fr has almost become a national characte and certainly one should not overlo H. L. Mencken, who is so ignorant his own qualities that he doesn't ev know he is nothing else but a ve special, and on the whole, somewh limited, form of entertainment.

The best light-verse writers amo us are, on the whole, producing bet work than any other kind of humori this due probably to the great dema for good verse during the past ten yea a demand doubtless the result of a rev sion against *vers libre* and other atrociti Among these the best are Arthur G terman, Newman Levy, Berton Bral Clinton Scollar

Then There Are the Women

James J. Mon gue, Ted Robins Arthur Lippma and Clement Wo

It will be noticed that I ha mentioned no women. The fact is t women humorists are rare. Al Duer Miller, on the whole, proba has the nicest sense of humor, but displays it only as a subordinate t among so many other first-class creat gifts. As a penetrative satirist, pr ably Dorothy Parker is our b woman humorous writer, both verse and prose. Carolyn Wells is far the best writer of nonsense ve The monologs of Beatrice Herford supremely clever. Nina Wilcox P nam (perhaps our only woman hum ist who resorts to slang) are alw highly, if not screamingly, uplifting

As for the columnists, there ar round ten who hold the honor F. P. A., Don Marquis, Heyw Broun, Roy Fricken, Ted Robin H. I. Phillips, Kin Hubbard, Jay House, Neall O'Hara, and "Bugs" B They depend quite largely u running comment, and many of th are helped out by unknown contri tors upon whom they have come depend for the daily grind.

It is interesting to observe t three of the best humorists among us are not of this soil. Pelham Gren Wodehouse, whose humorous stories re a constant delight, is an Englishm. So is Oliver Herford, perhaps our st impromptu wit. And Stephen Leac who at his best is very fine and at worst is terrible, was born in Can a.

E. R. ROOT,
Internationally known as a bee man.

Billions for Bees

The World's Purveyors of "Sweetness and Light"

By ALBERT SIDNEY GREGG

The bee has a record of honorable toil and achievement which extends back for thousands of years. In proportion to its size it is the greatest food producer that the world has ever seen. It is also an enthusiastic cooperator with man in the adoption of the most scientific methods of production.

HOW much do bees know?

Nobody knows.

For many years experts have been trying to settle this question. They have listed more than four thousand varieties of bees in all parts of the world, and traced their ancestry back to the beginning of things.

Bees have been analyzed, weighed, measured, and tabulated to the last degree, and results of this microscopic research have been preserved in numerous books with anatomical drawings—enough to make a fair-sized library.

Every student of the subject has faced the question of bee intelligence and turned away baffled.

We know how they behave, but why do they do certain things in different ways under varying conditions?

A common way of disposing of the question of bee intelligence is to attribute it to a mysterious "spirit of the hive," which seems to dominate the colony, and regulate the activities of each individual bee. The suggestion that bees are controlled by something higher than instinct is due to the fact that they are so resourceful in emergencies. But no matter how their methods may vary, it is evident that one unchanging purpose controls the life of a bee—the individual exists for the colony, and all of them labor and sacrifice for the future of the race. They live to accumulate honey for bees yet unborn, and to produce more bees to eat the honey that they have gathered, but the quantity of stored honey is always far in excess of their own needs and the beekeeper takes the surplus.

In an effort to discover the latest conclusions on this subject I talked with E. R. Root of Medina, Ohio, president of the A. I. Root Company, who is widely known as an editor, lecturer, and the author of many books on bees. Root has handled bees on a large scale for more than forty years and knows them intimately.

When I asked him for his views, he responded:

"The longer I study bees the more I am impressed with their remarkable intelligence. They learn by experience, and to a limited extent can be trained, which is not always true of human beings. In my opinion they are more capable than ants. While bees resemble ants in some respects there is a marked difference. Ants are destructive while bees are constructive producers of wealth. In one thing bees and ants are alike, and that is in the subordination of the individual to the colony spirit. They must have a gang or a group back of them, or they cannot function effectively.

"Most people think of bees merely as hard-working little creatures who spend all their time making honey, and who like to sting folks. Bees are gentle and docile when properly handled. They do not sting unless pinched or mistreated. They are wonderful workers, but at times they will become lazy, steal, kill, get angry, fight, strut with pride, exhibit jealous rage, reveal cunning, and indulge in play spells like children. While bees are devoted to their queen, they do not seem to know anything about affection or pity. As a member of a colony a bee will fight to defend her home, but placed by herself she is practically helpless. In controlling bees the first thing is temporarily to destroy the gang feeling by blowing smoke into the hive. The smoke frightens them so they cannot act as a unit.

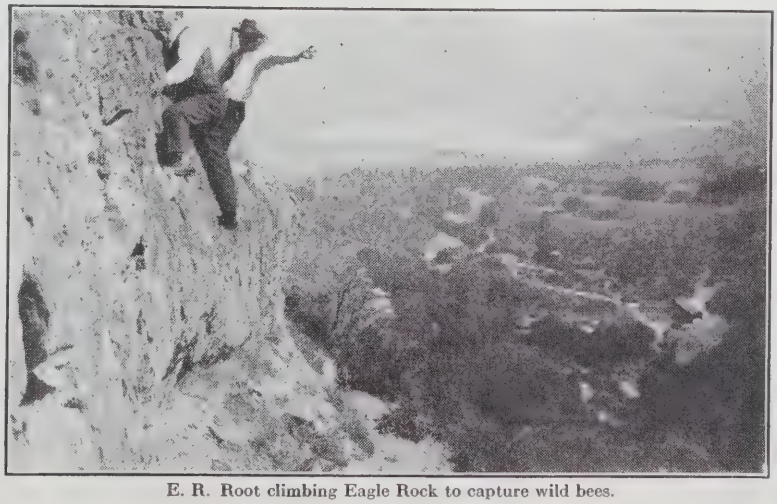
"Speaking of bee intelligence reminds me of a bee who quit working, and stole honey from her more industrious sisters," continued Root. "One day she came out of a hive so overloaded with stolen goods that she could not rise into the air. Apparently she either had to lose her plunder or be killed, but nothing of the kind happened. With the other bees in close pursuit, she crawled up the side of the hive, dived off, got a flying start, and escaped.

"On another occasion a beehive was entered by some black ants, who seemed to care more for the hive as a dwelling place than they did for the honey. Bees and ants lived together for a day or two, and then the bees decided to get rid of the little black invaders. It was done very quickly and thoroughly. Seemingly in response to a signal, the bees grabbed the ants, carried them into the air and dropped them a mile from the hive. And that was the end of the ants.

"Some honey in a railroad box car, standing on a sidetrack in our yard, got spilled over the floor as a result of a slight collision. Bees began to collect and search for honey which had been soaked up by shavings on the floor of the car. We washed the car out with a hose and had it unloaded and moved farther down the track. A day or two later the bees were very busy investigating all cars that contained shavings. Either they could read signs, or they reasoned that when they located a car with shavings on the floor they would also find honey.

"Last summer while on the Redpath platform, I had a rare chance to study the intelligence of bees. For a long time it was my custom to have colonies shipped on ahead for each engagement, but, owing to delays resulting from confusion in orders, I was obliged to use the same colony over and over again. Then I discovered that the longer I kept the same colony the easier it was to handle them, and I gave up the plan of using fresh bees.

"After I had been working with them a



E. R. Root climbing Eagle Rock to capture wild bees.

week or two, they seemed to wait for the next move in the program just like trained animals. For example, they got so the footlights did not disturb them any, and I could handle them as well at night as in the afternoon. During the day I would set the hive just outside the tent, and the bees would go right on making honey, just as if they were at home. When a new hive has been set up and the bees are let out it is customary for them to circle around rising higher and higher, until they have learned all the landmarks. They may do this in a few minutes and it may take longer, but they never fly straight from the hive at first.

"My lectures were given in a big yellow tent, and when the bees were released, that tent was all the guidepost they needed to enable them to find the hive. I carried that colony of bees all one summer, and reached home with a hive full of bees, brood, pollen, and honey. But I did not bring back the same bees that I had taken at the outset, for an entire new generation had been born and developed during the trip.

"Another indication of their intelligence is that the bees will readily coöperate with man in building the comb in which they store the honey. Left to themselves bees will generally follow the line of least resistance in the construction of comb. Modern beekeepers equip their hives with little square frames of wood that will hold about a pound of honey, containing a thin strip of beeswax, dented like honeycomb, which is known as "foundation." The bees will begin on this foundation and develop a comb with regular cells, which they would not do if left to themselves. As a result you can buy honey in the comb in neat little boxes, and the entire get-up is attractive and appetizing. The big point is that the bees are willing to accept the start given them by the beekeeper.

"It may surprise you to know that the bees have a regular system for cooling their hives to prevent the honeycomb from melting. When the weather is sultry the bees will set their wings going just as if they were flying, with the result that a current of air is drawn in at one side of the entrance and goes out at the other side!

"Several years ago our lumber yard at Medina caught fire, and among other things a hive full of bees was badly burned on the outside. In this instance the bees fought the heat with their fanning process and actually kept the inside temperature down to normal. The hive was charred all over and burned through on one side. An outer edge of the comb was melted but the bees stayed and fought. One of the men helped the heroic little fire-fighters by dashing a bucket of water over the hive, and putting out the flames. In that instance I see not only intelligence, but courage in the face of danger.

"The next time you see a piece of honeycomb be sure to study its structure carefully. You will observe that the comb consists of hexagonal tubes in two layers, laid end to end. The hexagonal shape gives the greatest degree of strength with economy of material and labor. Note how the various parts dovetail and brace each other. So marvelously exact is the size and shape of the cell in a honeycomb that the suggestion was once seriously made that the bee cell should be used as a starting point in fixing a standard of measure.

E. R. Root and his pets.

Bees reveal special intelligence when they adapt the cell structure of the bee comb to the varying requirements of a hollow tree, a hole in a rock or a box hive.

"Some bee students have held that the little wax tubes forming the comb are round originally and that the pressure on the sides makes them hexagonal. To find out just how the bees constructed the cells, an experimenter cut away a portion of a comb, and inserted a strip of tin to serve as a foundation, but without any wax on it.

The bees would have to begin on the bare tin to repair the breach that had been made in the comb. After considerable excited buzzing, they settled down to work, and started to make new cells which were hexagonal and not round. They accepted the metal as the bottom of the cells, but later discovered that the tin affected the taste of the honey. Then they cleaned out the tubes and covered the tin bottom of the cells with a thin coating of wax.

"One day a colony of bees found a dead mouse in their hive, and they held a council of war to determine what to do with it. It was utterly out of the question for them to remove the body, so they covered it with a shroud of beeswax, which safeguarded them from the dangers of decomposing animal matter. Snails sometimes get into a hive and the bees will seal over the open end of the shell and th make a prisoner of Mr. Snail. On occasion the bees found a snail with cracked shell, and in that instance bees covered the crack as well as open end with wax.

"Among bees the females are do nant. The average colony consists one queen, 10,000 to 100,000 fem workers, and a few hundred ma commonly known as drones. The qu lays tiny white eggs in wax cells, wh develop into bees in a few weeks. Yo bees build up the comb out of fla of beeswax which are supplied thro openings between the rings on under side of the bee's body. Ot young bees known as "nurses" f the larvae resulting from the e deposited by the queen, which in course of time will be metamorpho into bees, who become members of colony.

The younger set serve as s tinels at the door of the h Older females bring in honey pollen from flowers and blossoms, are called field bees. The poller used for feeding the larvae and yo bees.

"Sex of the bees is determined the queen who has the power to eggs which produce both males females. It is a curious feature of relationships that a male bee, c monly called a drone, has a mot but no father, while his sisters h both a father and a mother and father is a drone. A hen can lay that have not been fertilized but will not hatch. But that is not of the queen bee's unfertilized for drones come from such e Worker bees are undeveloped fem and do not lay eggs, except in cases, and when they do, drones the invariable result.

"A few days before a young q is about to break out of her cell, reigning queen will leave the accompanied by a swarm of The new queen then mates wit drone, who literally becomes fathe a multitude, for after she has fertilized a queen bee will lay 1,000 to 3,000 eggs a day, most of her offspring will be fe workers.

The drone who thus fathers su large family goes to his wedding his funeral on the same day, and is the end of him. Later when honey-making season nears a c the females will kill all of the remai males, who are nothing but big solent parasites.

"A queen bee does not ga pollen or nectar, and is not require do any of the housework of the l She has a retinue of servants, provide her with food and atten all her wants. A queen bee is a lady in every respect, except that does not govern her subjects. govern her.

"Two queens as a rule ca occupy the same hive in peace.

other and daughter may get along r a while, but a mother-in-law and a aughter-in-law are sure to quarrel. ueen bees are of a very jealous na- re. When rival queens meet they ill rush at each other and fight until ne has been stung to death. They erally pull hair and claw at each her in very human fashion. It is a rious fact that about the only time queen uses her sting is to kill another neen.

"By accident twelve cells contain- ig young queens were left a day or o overtime in a cell building colony. he first young queen that hatched out mediately declared war on her help- ss rivals still in their cradles. Each een cell was ruthlessly torn open, d all the little queens murdered. metimes the workers will not permit e oldest queen to kill the baby eens, and again they will participate the slaughter.

"This jealous hatred of rivals does t diminish as queens grow older. nce placed two old queens under a inking glass as an experiment. They ppled instantly, pulled hair, and ally one killed the other with her ng."

"How are queens obtained?" I quired.

"A queen can be created from the ne kind of an egg that will produce a rker, merely by a difference in ding, which is taken care of by the rker bees. Members of the colony ow instinctively when it is time to r a new queen, to take the place of e mother who is growing old, and ey go about it methodically like ey do everything else."

"You said at the outset that bees metimes learn to steal. Can you ve an instance?"

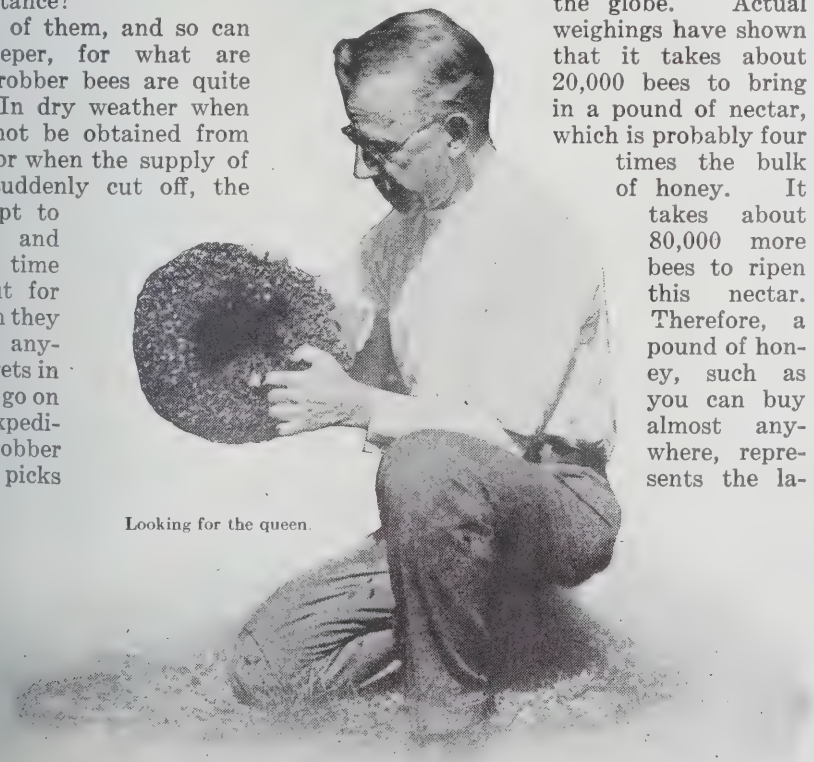
"Plenty of them, and so can y beekeeper, for what are own as robber bees are quite mmon. In dry weather when ney cannot be obtained from e fields, or when the supply of ney is suddenly cut off, the es are apt to ; ugly, and t is the time l look out for m. Then they y sting any- dy who gets in th way, or go on obing expedi- ins. A robber erally picks out a weak colony, slips by the sentinels, pretends to belong to that hive, and leisurely loads up with honey that has been gathered by the hard toil of other bees. If she is caught in the act, she may be killed on the spot. In the event that she escapes with her plunder, other bees of her colony will follow her on the next trip, steal all the honey that they can possible carry away, and sometimes leave the despoiled bees to starve. However, the robbers are not always victorious. Sometimes the attacked colony will fight, and the outcome will be a pile of dead bees on the ground in front of the hive.

"Once bees discover that they can get honey by stealing it, they seldom reform. Stolen honey with them is a good deal like easy money among human beings. Sometimes their thieving habits may be corrected by removing them to another yard—a change of 'environment'—but it is generally cheaper in the end to kill them outright."

"How long do bees live, how far can they travel, and how much honey can one bee gather in a season?"

"Workers live about six weeks in the height of the season, and when they have their wings torn by flying among trees, or grow old, they either crawl away from the hive and die, or are carried up in the air by the younger bees and dropped. Queens may last for several years.

"The average flying distance for a bee load is a mile and a half. If one bee could gather enough nectar (four pounds) to make one pound of honey, she would have to make 80,000 trips of a mile and a half each or fly a distance equal to more than four times around the globe. Actual weighings have shown that it takes about 20,000 bees to bring in a pound of nectar, which is probably four times the bulk of honey. It takes about 80,000 more bees to ripen this nectar. Therefore, a pound of honey, such as you can buy almost anywhere, represents the labor of 160,000 bees, and yet a good colony may gather as high as two or three hundred pounds of honey in a few weeks.



Looking for the queen.

"I have placed a large beehive on scales in our bee yard on a bright warm day when the nectar was flowing freely, and the bees would bring in from ten to twenty pounds of nectar before dark. During the night they expel the excess of water from the nectar by fanning and thus convert it into honey. Another interesting feature is that, as a rule, the bees who gather the honey do not eat it, but it is laid up for the next generation and for those who own the bees.

"It is estimated that the value of honey produced by bees in the United States in one season is more than $75,000,000. Strained honey in tin cans, in bottles of various sizes, and honey in the comb is shipped by the carload into the big cities of the land, where it is quickly consumed in the hotels and private homes. Beeswax, another product of bees, of wide use in the arts and industries, is valued at another $4,000,000. But that is not all by any means. In gathering pollen for food, the bees are of great service in pollinating fruit trees. In so doing they make more and better fruit. Their value in this respect is about ten times that of the honey produced, and this item alone represents a total of $750,000,000. Bees are thus worth nearly a billion dollars annually to the people of the United States, and this amount could be easily doubled, by raising more bees and starting more fruit ranches.

"Pollination of fruit trees is not a theory. I have tested it out myself by covering a limb before coming into bloom with mosquito netting, so the bees could not reach the blossoms, with the result that almost no fruit was borne by that branch, while all the rest of the tree was loaded. All intelligent fruit growers recognize the value of bees in this respect."

"Is it true that a bee dies when she stings?"

"She does if you are quick enough to smash her. Otherwise she will either pull the sting out, or lose it and go on her way. A bee sting is a wonderful mechanism. It consists of three hollow needles, two of them with barbs, which slide back and forth, two muscles that operate the needles, and a poison sack, all forming a complete unit. When a bee sinks the tiny point of her sting into your skin and the barbs take hold, she will begin a twisting motion as if she were trying to pull a cork from a bottle. If she is unable to remove the sting she will break loose from it. Although the sting may be separated from the bee, it is a thing of life. The little muscles continue to work the barbed needles back and forth, and every thrust carries them deeper into the flesh, and also releases poison from the poison sack. By actual obser- (Concluded on page 28)

School on Wheels for Negro Farmers

Agricultural Instruction Delivered Free at the Pupils' Homes

By C. E. GAPEN

THIRTY thousand Alabama Negro farmers, grateful for what has been done for them by Booker T. Washington, the Tuskeegee Institute, the State Agricultural College, and the U. S. Department of Agriculture, bought a two-ton motor truck, equipped it as a traveling agricultural school and gave it as a present to the Federal and State Agricultural Extension Service. Few tributes to the value of modern agricultural teaching have been more impressive than this one from farmers whose crop of actual cash is usually small.

On one of the side panels of this truck in neat lettering is the following explanatory statement: "This truck with its equipment was dedicated to the Federal and State Agricultural Extension Service by the Negro farmers and their friends of the State of Alabama, in appreciation of Tuskeegee Institute and in memory of the late Booker T. Washington who helped to make Negro extension work possible and who loved the country people and the great, big out-of-doors." This truck is the third which has been engaged in carrying the gospel of better agriculture to the Negro farmers of Alabama. The money for the first one was secured by Booker T. Washington from a wealthy northern philanthropist. This was known as the Jesup Agricultural wagon and it was drawn by horses or mules. A little later the Knapp Agricultural truck was substituted for the wagon, making it possible to carry more equipment and helpers and to cover more territory. This truck has visited every county in Alabama having a Negro agricultural extension agent. And now comes the big Booker T. Washington truck which last year traveled nearly 10,000 miles.

Many readers may wonder why it is necessary to go directly to the farm with the agricultural school. The natu question is why not have the farme and their wives congregate at some ce tral place where more could be reach at one time. But Booker Washingt who fathered this idea, knew the cou try people of his race too well to belie in the efficacy of that method to rea the farm families that were in great need of help. He knew that the Negro in better circumstances would not difficult to reach but the poorer or who lived, many of them, in miserab shacks with little to wear had not t moral courage to go to these meetin The traveling school solved the pro lem. It goes directly to some farm a the nearby neighbors are invited come in. Contrary to the usu custom, not one of the best far is selected but one of the po est. Here, with a boundl opportunity for impro ment in the home, garden, and in the fiel it is possible to impr the "students" with possibilities for ra improvement at sm cost.

This new truck i a schoolhouse which, c sidering equipment the force t goes along wh it, is much m impressive th the little schoolhous or little schl houses of y color. Te teaching st consists of a m

agent, a woman home economics teacher, and a rural nurse. While the nurse and the home economics teacher are instructing the women, the agricultural agent directs the men of the neighborhood in work in the fields or in improvement work on buildings, fences, and so on. They do not attempt to get results with mere words and because of this policy most of the time is spent in directing the "students" in doing the actual work which they are expected to do on their own farms later. For instance, the men may spend a good part of the day building the proper kind of poultry house to take the place of some dark unventilated shack which previously has housed the flock of hens. Or if the season is right they may spend their time preparing and storing sweet potatoes or improving the sanitary equipment in the home. Many times they build steps for the house and put up substantial fences out of material already on hand on the farm. The object is to make the farm more efficient and the family more self-sufficient.

While the men are working on the outside the women are learning better methods of preparing food, of making clothing, of caring for children and of utilizing many things that might otherwise be wasted. Sometimes the home demonstration agent has the woman of the house collect all of the discarded clothing which is washed and the rags made into rugs. This work is actually done during the day so that there need be no question about how it is done. Naturally most of these homes are lacking in a great deal of equipment which they should have. This equipment the truck supplies for the day. This is also true of the work in the garden and on the farm. The truck carries a complete stock of farm implements and of home conveniences such as the average farmer probably would be able to buy or construct for himself. Also the truck carries its own lighting system, and for the entertainment of the "students" after the day's work is done, a motion picture outfit and a phonograph.

The Windows Are Invariably Closed at Night

Naturally, there is a great deal of work to be done by the rural nurse who accompanies this itinerant school. When it is considered that six to eight persons often occupy little houses of two or three small rooms, advice on hygiene and sanitation is of great importance. The homes, as a rule, are poorly constructed with tiny windows which are almost invariably closed tightly at night with all visible cracks in the house filled with old clothes in fear of the night air. The first job of the nurse is to gain the confidence of the people she wishes to help. It is hard to believe that so much difficulty could be encountered to accomplish such a simple thing as the ventilation of a room, but one of these nurses tells of its great difficulty. Often the woman will compromise by agreeing to start in by keeping one window open and leaving the rest closed.

Because of ignorance and poor housing conditions sick members of the family are frequently crowded with the well members and thus diseases are spread. Care of sick persons is one of the important things taught by the nurse in addition to sanitation and hygiene. Then there is the problem of proper food. A large share of these small Negro farmers have fruit, vegetables, and milk and eggs in plenty from which they could have good balanced meals yet, say reports to the United States Department of Agriculture, a large number of them prefer a meal composed of corn bread, fat meat, and sirup. The older persons not only eat this ration themselves but give it to their children.

The Garden as the Source of Plenty

One of the home demonstration agents tells an amusing story of a Negro woman at a small house where she was stopping for a day with the truck. She was greatly disturbed because, as she explained, she had sent her boy to the store six miles away to get some cabbages for dinner and he had returned with the report that there was none to be had. She said she had nothing in the house with which to make a meal. The agent noticed a luxuriant garden back of the house full of vegetables ready to be used and asked why she did not use her home-grown vegetables. The explanation was that for company she always desired something from the store. The agent soon convinced her that the garden was the best place after all and the dinner that was prepared that day made such a decided hit with the farmer that he asked that "receipts" be left with his wife for soup and a number of other dishes described by himself as the best he had ever had.

Not all the attention of teachers is given to food production and home improvement. They realize that many persons do not know how to play and that the children on a large number of these little farms know of no good games. So at the end of each day the whole group of "students" is given instructions in playing. Simple games are used in which all can participate such as volley ball, tug-of-war, foot racing, shoe racing, and many others. It is a frequent comment of teachers that even the old and decrepit take an interest and finally try to take part.

It is evident that such a school as this is an event in an isolated rural colored community and that the things that are done and discussed in these few days will be apt to make a lasting impression. Then when it is considered that during the last year the movable school was conducted in twenty-two counties of Alabama, each school lasting in a community from four to five days, the improvement in the prosperity and comfort of the people must be enormous. The attendance at the school has been increasing every year and these colored farmers and their wives are more interested in farming and home making than ever before.

What, No Corned-Beef-and-Cabbage!

(*Concluded from page 8*)

to his frau was tinged with a certain aloofness, pity, superiority, which she shared with wifely approbation.

The best description I can give of our company is a comparison to any aggregation of good, plain Americans as may be gathered together at any general function in any village or town in the United States, whether it be the induction of the new mayor, the laying of the church's cornerstone, or the graduation from school. That is why my best bet is in favor of the cabin-ship—it represents without frills and without fears just what goes on back home. It is not necessary, as many passengers think necessary when they go a-traveling, to vest themselves with a new personality, to adopt stilted mannerisms, to be what they are not. It is not necessary on a *Leviathan*; impossible on a *Republic*.

Out of my investigation and experience one thing, above all, stands out. That is the attitude of Americans toward the merchant marine, so far as they have articulated it in my presence. I found many kickers against them; not one kicker among the foreign passengers.

I reserved this item for the very last, but it is the most important of all.

Probably there is no key; at least there does not seem to be a key. Using all my reportorial ingenuity I failed to discover an answer. Americans who never before crossed the ocean spoke with a finality against "American ships and this rotten service" as sophisticated and experienced foreign travelers praised the "unrivaled" or "unexceled" treatment and management. Is the explanation, the age-old and wisdom-defying explanation that the other fellow's things are best?

But even in spite of these dissenters, the response to the little bit of a lopsided American fleet we have has been wonderful. To ship operators under foreign flags it is still unbelievable, because there is no question that the odds have been against our ships—odds made up of experience, efficiency, method, number and good-will.

It is much safer to take seriously, as an indication of value, a foreign competitor's appraisal of our new undertaking than that of Americans. The verdict abroad and here of the former is evidence—and all the evidence necessary—that irrespective of mistakes the merchant marine of and for the United States has a place in the world not because it is attempting to make one but to resume one.

Are Americans Flattered and Hated?

(*Continued from page 5*)

in defining this feeling than to quote from an editorial which appeared in the Hongkong *Telegraph*, printed while we were in harbor there. It was a thoughtful editorial directly addressed to the passengers on our ship, and reprinted, as I am informed, for distribution to other American ships. It told us that there would be no official welcome; that the people of Hongkong had to work for a living, and that most even of the English-speaking part of Hongkong would not care whether we came or went; but that all of them hoped we would have a good time and make better use of it than some American tourists did, and that when we left we would have a pleasant and profitable voyage. It was blunt enough, in all conscience. Perhaps I had better quote a paragraph from it:

"When you land in the British colony of Hongkong, there will be no official representative of our government down at the pier to meet you; there will be no community welcome; you will find little or nothing in the way of handbooks or folders to tell you all about the place, and the majority of you will depart just as much strangers as when you arrived. You will probably agree that the sudden influx of some hundreds of strangers into a small city like Hongkong (and the European part of it is small) must be just a little disturbing for those who ordinarily are busy with their daily tasks, and if there should later be among you the impression that Hongkong as a whole didn't seem to care very much whether you came or went, that impression would be a fairly accurate one. It would be false to say otherwise. . . . Forgive us, if we appear cold. . . ."

They meet him with rare courtesy and though he may pay double price he leaves with a comfortable feeling.

It was very frank, very honest, very English, and perhaps we ought to have said, "That is all we ought to expect. They wish us well, and do not intend to take time to bother with us; we wish them well, and are if anything more short of time than they are."

But after we get to Manila, we say to ourselves, "These Manila people also have to work for a living, and so did those in Honolulu. Why should there be such a difference?"

Moreover, when we turn over the pages of the daily papers at Hongkong and read their "Colyum" and their personal items, we feel it more. Here are two or three items suggested by our presence in Hongkong:

"If man is what he eats, then they must serve a lot of hard-boiled eggs on these round-the-world liners."

Another quip concerned the length of the one-dollar bills on board our ship, if they were placed end to end. They were rather ill-natured jokes, easily written by men who had told us frankly that they had their daily job and had no time to welcome us or see us off.

The point is this, that those English reporters and editors would not have made jokes of this sort (assuming these to have been intended as jokes) if they had met us personally and thought of us as friends.

At banquets where English and Americans sit down together, there is much talk of hands across the sea and of blood being thicker than water, but actually the British do not feel as spontaneously warm toward us as we might think. As for other nations, some of them cordially dislike us.

I have been putting this question to different people in strange lands, "Why do other nations flatter us and hate us?"

Taking a large number of answers from representative people, I get this result:

"Other nationalities flatter Americans because Americans are supposed to have money, and Americans, therefore, are not to be ignored; they hat Americans because Americans are th least internationally minded of all peo ple."

In amplification of this statemen I hear such things as this:

"In England everybody knows abou foreign lands. Americans may smi because an Englishman does not kno how far it is from New York to S Louis, but he knows when the mails g and he lives and moves and has h being in a world that has intimate r lationships with Paris and Berlin ar Prague and New Zealand and Australi

The American knows abo the trains from Omaha to Kans City, and the differential freig rates between American point but he has no knowled of international matte and is devoid of an inte national mind. He kno only one language. It foolish to suppose that cause he studied Fren or German in high sch he knows those languag he merely got passi grades in them. In Euro every man with a preter of education can speak t or three languages, a nearly every man at t head of any large conce can read the newspap in several tongues. T American has no st knowledge or basis friendly relationships.

"Further," it is said me, "the American s poses that he can do a thing with money. makes no intellectual pr aration for a tour abro. His mind is satura with business up to e minute of his depart He thinks that he will on deck and read gui books and learn all t he needs to know ab each country as he proaches it. This calls a self-discipline to wh he is a stranger. He s gives it up. He plays bridge, picks a smattering of knowledge, and trie make up for his ignorance by the us money. He does not use his mo wisely. His tips are sometimes so travagant as to make the people serve him extortionate toward th who must constantly employ them, at other times they are miserly. W the American gets it into his head t the dollar is a very large coin in o lands, he often overdoes the matte his calculating values, and is penuri Learning, as he has to learn, tha many places bargaining is expected beats down prices (*Continued on pag*

How the Slavs Came to Europe

At Least One in Every Ten Americans Belongs to This Great Race

By ALBERT ERNEST JENKS
Professor of Anthropology, University of Minnesota.
Copyright, 1924, by A. E. Jenks.

MERICA is interested in the Slav, because, in terms of the peoples from Europe who are building our nation, he is ming large importance. Today numbers more than 10,000,000 merica. At least one in ten of us avic.

or seventy-five years Europe has her yardstick on the Slav. Of the e great peoples who at the be- ing of that time were in natural petition in Europe. the Slav was l in numbers, Latin second, Teuton first. ay the Latin is il, the Teuton nd,' and the is first. The ern world today s on the Slav. s an unknown l force.

uthentic his- al records show the Slav has in Central pe for 2,000 s. Five hun- e years earlier e are historical t of people in ame area who undoubtedly at race. An r, distinctive iage presup- s in much ear- rehistoric times ographic nest in which the race made.

or at least 1,500 years history os, frontier by frontier, the marvel- dvance of the Slav from his early s His steady centrifugal flow, and s ssimilation of and amalgamation t different peoples, seems to be noth- ess than an irresistible world force. as spread over a larger area of con- uous land than any other race, pos- ng today one-sixth the earth's land ce, and annually strengthening his is to these lands by his great dity. He numbers today at least 0,000,000 in Europe and Asia.

is historically clear that isolated as, locked-up mountain pockets, the interior of vast forests have oduced distinctive peoples. Where s the original area of the Slav? er what conditions were his dis- ishing characteristics produced? an extensive territory in Central pe stretching southward from the lc Sea to the Black Sea, and east- r from the Vistula River, the rathian Mountains, and the Dnies- iver, is a distinctive physiographic e—the drainage basin of the Dnieper River. Following the third European glacial period, the melting snows and ice of the Baltic glacier formed an immense lake in what is now the headwater's area of this drainage basin. During the succeeding millenniums that fresh-water lake has been slowly emptying southward into the Black Sea.

The red colored area is racially predominantly Slavic, and annually becomes increasingly more so. I. Heart of the original Slav nest. II. White Russian. III. Great Russian. IV. Ukrainian. V. Pole. VI. Czecho-Slovak. VII. Jugo-Slav. VIII. Bulgarian. IX. Rumania is largely Slavicized, in spite of its written romance languages. Even that possesses twice as many words of Slavic origin as of Latin origin.

Much of it has now become well drained. The center of this drainage area is a depression ranging in altitude from about 280 feet to 560 feet. It is a veritable nursery of rivers. The upper Dnieper, "beginning in a great marsh and issuing from it as from its mother," says an early writer, flows southward through its entire distance. The Berézina "winding sluggishly and circuitously through a trail of marshes and pastures" from the northwest, the Pripet from the west, the Soz from the north, and the Desná from the northeast, all empty into the Dnieper within this pocket of low altitude. Mostly within this pocket, but falling short of it everywhere except a small area in the southwest, is a lesser distinctive area of about 33,000 square miles, called the "Polissye" or forest land.

The Polissye is fairly well within a triangle with the city of Mohilev at the north point, Kiev at the south, and Brest Litovsk at the west. It embraces, roughly, the present Russian provinces of Minsk, Mohilev, and Northern Volhynia. This district is so distinctive that it is known everywhere in Europe as Europe's most extensive swamp area. Immense marshes often 200 to 600 square miles in extent, ponds and small lakes, peat bogs and moving sands here intermingle with dense forests. Dr. Stephen Rudnitsky, geographer at the University of Lemberg, says of these primeval forests, "Above this swampy fen rise, like a vast mass of pillars, the knotty trunks of century-old oaks, and lindens, ash and aspen, and the slender pine and fir. High above the ground their branches intertwine. All strive up toward the sun, for a continuous semi-darkness reigns below. Shrub and herb vegetation thrives only in clearings; beyond that only last year's leaves, needles, and a mysterious glowing decay cover the ground. Dead silence, only occasionally broken by the hammering of a woodpecker or by the timid voice of a bird, reigns everywhere, making all the more impressive the mighty roaring of the lofty crowns in the storm." The Polissye from Minsk southward is still 38.2 per cent forest.

All evidence points to this area of forest swamps as the heart of the original nest of the Slav. Herodotus, in the fifth century before Christ, in his enumeration of peoples north of the Scythians, mentions several tribes who were undoubtedly Slavic. Among these were the Neuri whose territory was confined by a "vast lake," and the Budini, of whom he says, "their country is wholly covered with all kinds of trees; and in the most woody part of the forest lies a large and spacious lake around which are marshes and reeds; in the lake otters and beavers are caught."

The first known reference to people unquestionably Slavic is in the last quarter of the first century. Pliny and Tacitus mention the "Venedi" and the "Veneti"—the early name for the Slavs. In the original form this word was probably "Vende"; and as

"Wenden" and "Winden" it has always been used by the Germans to designate the Slavs in general.

The writers of the first centuries locate the Venedi in an area between the Carpathian Mountains and the Baltic Sea (the "Venedic Mountains" and the "Venedic Bay" of Ptolemy) and between the Vistula River on the west and the Desná and Dnieper rivers on the east. Tacitus places them in "woody forests." Jordanes, the Goth, writing in the sixth century, says that near the left ridge of the Carpathians "which inclined toward the north and beginning at the source of the Vistula, the populous race of the Veneti dwell, occupying a great expanse of land . . . They have swamps and forests for their cities." He adds that, though of one stock, they had three names, that is, "Veneti," "Antes," and "Sclaveni." This latter term, or others closely allied, has been the name of the Slav since the sixth century. The name is indigenous, the form being "Slovene." It is probably derived from "Slava," meaning *glory*, the word having been first a place name.

Nestor, the Slav monk of Kiev, writing in the twelfth century, tells in much detail of groups of savage Slavic people who in the ninth century dwelt in this area of forest swamps. Among them were the Dregovitchi (swamp people) between the Dvina and the Pripet, the Volinans in Volhynia, and the Drevlians (forest people) "who lived in a country thickly forested on the shores of the Pripet where exist yet today villages which owe their origin and foundation to them." Around the periphery of this area Nestor places many other tribes who had migrated farther afield.

Though indisputably early Slavic geographic names are scarce in Europe, the two rivers whose names are accepted as Slavic, the "Desná," and the "Berézina" (birch tree) both flow into the Dnieper within this area. Of two geographic land areas whose names are indisputably Slavic, one, "Volhynia," lies in the southern part of the area, and the other, "Podolien," adjoins it on the south.

The Retreat Into the Forests

Deeply hidden away in those vast forest swamps, the ancestors of the Slavs were isolated and segregated in a prehistoric period during the time required for shaping the Slavic language and temperament. Always the place was a safe retreat. When enemies attacked, the people withdrew deeper into the forest swamps which befriended them, but which have undone their enemies times without number. We are told that the Neuri retreated northward from the attack of Darius in the sixth century before Christ. That northward retreat into the forests has in later times constantly shielded the Slav from invading eastern hordes. It was in this area that Napoleon, even in the last century, retreating from Moscow, lost a large part of his army crossing the Berézina. It is no place for a foreign foe to enter.

How a People's Characteristics Were Developed

The Polissye was an excellent breeding place for a non-warring people. Food, clothing, and materials for shelter and fuel were abundant. Early and later writers alike speak of the streams as stocked with fish and eels. Sturgeon, "the porpoises without bones good for pickling," of Herodotus, and other salt-water fish swarmed up from the Black Sea. One enthusiastic early chronicler says that "in the spring the fish so swarm in the rivers that a spear thrown in stands upright." The lakes, ponds, and sluggish backwaters offered excellent breeding places for swans, geese, duck, coot, and other aquatic birds which are still very abundant there, and partridges, grouse, and heath fowl flourished in the drier areas. Beaver, otter, mink, and other fur-bearing water animals were plentiful. Even as late as the middle of the sixteenth century, bison, wild horses, and deer were so abundant that they were "hunted merely for the sake of their skins; of their meat only the choicest cuts of chine and loin are used, all other parts thrown away." Many kinds of deer stocked the forests, the small local grass lands, and the pastures of succulent aquatic plants. Bees seem to have made the Polissye their special abode, and the Slavs early were beekeepers, a considerable folk art and lore having developed around bee culture. They were famous for their mead—a drink made from fermented honey. In Europe forest-bee culture survives only in the Polissye, and there today beekeeping, hunting, and fishing are still important sources of income for the peasants.

Nowhere in the area of forest swamps did the early Slav develop large trading centers, but many dwelling sites for large families and even for small communities were found on the low sand piles and dunes in the north and along the low alluvial river banks toward the south. The main roadways were water in summer and ice in winter. Even today a few of the communities in the area are accessible at all times only by the sluggish waterways—"flowing roads," the people call them. Remains of ancient sites have been explored which show that the Slav took advantage of the slight land elevations, where he built small log dwellings inclosed in earth embankments serving as dikes against the annual flood. Near his dwelling he burned the forest, made small clearings, practiced simple agriculture, and with the product of his forest bees, half-wild herds of cattle, hunting, trapping and fishing, he lived crudely.

The forest swamps favored the development of equality between man and man, as there was scant place among the scattered forest groups for the rôle of leader. The Slav was away from all that would foster lea ship. The idea of organized con either political or economic, was part of his early culture.

Subdued emotions were fostere the forests. All writers have agree describing the dreariness and gloo the Polissyean landscape. There no roaring waters or those w laughed their way over falling cou Throughout this region the Dn River has an average current of thirty-seven feet an hour. There no seas with challenging roll of brea No sunsets behind mountains st the glories of emotions. Even with brightest weather the forest days born slowly without splendor, died gradually into increasing gl

Thus in the unique and domi environment of the Polissye the cestors of the Slavs, fairly prot from enemies, and supplied with necessities of life, though with rude labor, were able to live generations necessary to standa their type of speech. There the Pol compelled its denizens to de certain characteristic temperam reactions which have marked Slavs in their geographic expa since those early formative days. they were so sufficiently fed, clo and housed that they filled thei cestral nest to overflowing and st in time enduring migrations i directions.

Who the Slavs Are Racially

Racially, are the Slavs? question has some perpl aspects for the anthropologist. progenitors were unquestionably a of the brachycephalic, or broad-he Alpine race. That race came west into Europe in the Bronze Age, wedged itself in between the two e dolichocephalic, or long-headed, which already occupied most of We Europe—the Teuton on the north the Mediterranean on the south. Slav is today broad-headed. In measureable physical characteristi is typically an intermediate typ tween the extremes attained by tall, blond Teuton and the short, Mediterranean.

The perplexing problem of arises from the fact that for the half of the Christian Era the an tombs in some Slav areas rev preponderance of long-headed sku

There are two conditions t taken into consideration in this lem. One is that it is known the Slavs, in common with other Al burned their dead. Nestor says c early tribes: "When anyone car die they made a great lamenta They raised up for him a great fu pyre where they placed and burne body; after which they gathere ashes in a small urn which they p on a column on the border of the Thus do the Viatitches to this

e to this practice of burning the d and placing the ashes in small tery jars which were most commonly ied, most of the "burials" of the y Slavs would be without sufficient letal materials for identification of d-form. Also it is known that in r early dispersion, especially in general northward direction, there much quite indistinguishable in- enetration of the Slav and the g-headed Teuton. Consequently we well suppose that some of the y skeletal materials which so sur- ingly show the long-headed type, not be Slav skulls but those of ns—the skulls of persons whose ial was non-Slavic in custom.

We cannot question, moreover, the Slav must have been modified ng his early dispersion by ad- ture of long-headed peoples. A part he long-headed skulls found may the result of this modification. It ld seem that the developing brachy- naly of recent generations may be to the fact that he has about com- ed the absorption of the long- ded alien peoples in the lands he has tinued to occupy, and at last is uming his original brachycephalic d-form. Measurements reported in 3 show that the White Russians living in the forest swamps of the inal Slav area have the broadest ds of all the Slavs.

Whatever else may be concluded on question, it is not reasonable to ose that the ancient Slavs and the ent Teutons had originally com- n ancestors. From the earliest rds the two peoples have consist- y exhibited markedly different tem- peramental and cultural characteristics.

The early proto-Slavic language from which developed the numerous Slavic languages and dialects of today was of the North European branch of the Indo-European language. It is fairly well preserved today in the Old Church Slavonic. It was allied to the early tongue from which the existing neighboring Lithuanian and Lettish languages are derived. It would seem that in early prehistoric times the progenitors of these two modern language groups must somewhere have been geographically close together. The ancestors of the Slavs became shut up in their segregating forest swamps, while those of the Lithuanians and Letts and their now extinct kinsmen, the old Prussians, were lured by the bounties of the Baltic Sea to its border. In each nest was developed and fixed its distinguishing type of language.

The formative work of the Slav nest was well completed by the dawn of the Christian Era. The Slav had developed without influencing or without being influenced by the great civilizations of Europe—the Greek or the Roman. The nest was filled and overflowing. By the first century, the "flowing roads," leading in and out of the forest swamps in all directions, had drawn many of the most daring individuals into the surrounding lands.

The early migrations of the Slav among alien neighbors was by the cumulative process of community interpenetration. He had the power of expansion and absorption.

To the north and east, with admixture of Finnic blood, he became the Great Russian. To the south, by contact with the Tartars, he developed the Ukrainian. From his occupation of the Balkans have come the present Slovene, Croatian, Servian, and Montenegrin. An absorption of the later invading Bulgars by the Slav in the Southern Balkans produced the Bulgarian. The Rumanian is also racially largely Slavicized. Czech and Slovak tribes, coming through the Moravian gap of the Carpathians and settling in the old lands of the Celtic Boii, were the ancestors of the Bohemian, Moravian, and Slovak. To the northwest the Slav tribes flowed over most of present Northern Germany, left weak by the southern forays of Teutonic tribes, and for several centuries they occupied the Baltic shore from the Elba to the Vistula rivers. They were dispossessed of those lands only after long warfare in the tenth and eleventh centuries. Only there has the Slav failed racially to hold the lands over which he has spread. Between the Slav and the Teuton there has been more or less continuous warfare for some 1,500 years. The eastern line of battle in the World War was only a continuation of this age-long struggle. Our word "slave," and its cognate in European languages, comes from the time in this early warfare when Slav captives were sold in the slave markets of Europe. The ancestors of the present Pole had very early migrated to the open plains they have since held racially, in spite of disastrous political vicissitudes.

The characteristics which distinguish the Slav will be the subject of a succeeding article.

Are Americans Flattered and Hated?

(*Continued from page 24*)

lch in some cases ought not to be eaced, and in other cases still is rged double because he does not learn aies. He is a remorseless bargainer, n is most deservedly swindled."

Then, I am told, and I partially eeve it, "Americans have the worst hners to be found on earth. The rlish are rude and the French are ncere and uncivil, but Americans r boorish."

I was in a large hotel, and as I went oard the elevator from my room, I ountered, at the intersection of my oridor and another, a group of three eons—a chambermaid, a porter and n of my fellow-passengers, a lady in a ono. She had encountered these w persons as she was on her way to her on, and in sheer good-nature she toped to talk to them. Speaking illy and very slowly, and making ch shrill and loudly spoken word the re emphatic by a gesture, she de- nded of the porter regarding the hmbermaid:

"SHE—YOUR—FRAU?"

He courteously replied in the negative, and the chambermaid confirmed his denial:

"Oh, no, no, madame!"

Other questions, equally direct, and addressed alternately to the man and the maid, evoked the information that not only were they not married to each other, but that neither of them was married to anyone else. Then followed this question, addressed to the man:

"Well, why don't you marry her?"

Can any one imagine a ruder performance? Yet this American woman, as I have observed her on shipboard, is not unladylike. She is simply a rude American, no ruder than thousands of others. She will write an excellent paper for her Woman's Club when she gets home, and none of the friends whom she deservedly possesses will suspect that abroad she was a boorish, uncultured woman. And she is not such a woman at heart or all the time. But who could love a woman who could do such a thing?

What unpleasant voices we have! How harsh and unmusical, at a little distance, sounds a conversation between Americans as compared with one between other nationals. What a blessing it would be if we could learn to modulate!

We are not as openly boastful as the English and other nationals are inclined to suppose, but we make it altogether too apparent that we are ready to teach rather than to learn. An American, visiting a foreign country, might easily suppose himself to have great need of learning from others and to have little time to teach. We are too ready to impart information, much of it unreliable. How quickly we pick up odds and ends of knowledge and how swiftly and inaccurately we pass it on may be illustrated by the gossip on shipboard. Let any unusual event occur, and in an hour there will be a dozen explanations. One woman will tell another that a man told her that he was informed that the captain said any one of forty absurd things, and they will be believed and repeated without investigation. In equally unreliable ways do Americans pick up what they call information on shore, and pass it along and distort it with the telling.

An American school- (*Concluded on page 28*)

Billions for Bees

(*Concluded from page 21*)

vation through a microscope I found that a bee sting will continue working for twenty minutes. I have deliberately had a bee sting me on the back of my hand so I could study the operations of the sting at close range.

"When you get stung, don't try to pinch the end of the sting to remove it, for if you do, you will merely squeeze more poison out and drive the sting in deeper. The way the professionals do is to scrape the sting sideways with thumb nail or knife. After you get the sting out, use hot and cold water alternately, and the soreness will gradually subside. A regular beekeeper pays no attention to a wound from a sting other than to remove it. Some folks apply baking soda to a bee sting, but that does not help any."

"Is it true that bee stings are good for rheumatism?"

"In my opinion they are not a remedy, but they may serve as a counterirritant. There are cases where bee stings have helped the victims of rheumatism, but the expectation of the patient had much to do with it. I was once afflicted with rheumatism, and I put bees in my bed and actually laid on them so that I would get thoroughly stung, but I did not get any permanent relief."

"What is the best way to avoid being stung?"

"Get out of the way of bees when they are angry. You will remember that I said bees would sting on a day when they could not gather nectar in the fields. If you cross a bee's line of flight when she is returning to her hive, she is apt to sting. Don't argue with an angry bee, any more than you would with an angry man. When she buzzes back and forth in front of your nose, don't strike but retreat and avoid her. On a bright warm day, when nectar is plentiful, and the bees are all busy they do not have time to stop and sting anybody, and on such occasions you can walk through a bee yard with comparative safety, but even then you must avoid their line of flight. It has taken some beekeepers a long time to learn the effect of the weather on the temper of bees, so I am not surprised that others do not know all about it."

Each summer Root lectures on bees for the Redpath Chautauquas, and he talks daily to audiences ranging from 1,000 to 3,000. There is such a demand for him on the platform that he has enough dates ahead to keep him going for some time. Furthermore, two motion picture companies have made films of some of his demonstrations and have shown them to millions of persons.

As a part of his Chautauqua lectures Root takes a hive of bees on to the stage, pours the bees on to a newspaper, dumps them into a pan, turns them into a hat, and puts the hat full of bees on his head. Then he pours them back into the pan and tosses the bees into the air. He waves his hand and the bees obediently fly back into the hive. The explanation is that the bees have been demoralized by being shaken. Root has broken the colony spirit, and the individual bees are helpless. They return to the hive, not because Root waves his hand, but because the queen has been left in the colony home, and the bees will always go to the mother.

Some maintain the camera is the handmaid of art, while others hold that art is the handmaid of the camera. In our next issue there will appear an article in which the whole field of modern photography is reviewed and discussed. Picture taking is a most fascinating pastime. But many get photographs that are not pictures.

While in California one season Root was asked by a motion picture company to pose for a demonstration that would be a regular "thriller." Root accepted the challenge, and led the cameraman to the top of Eagle Rock, a thousand feet high, overlooking Hollywood. They climbed for two hours up the face of a cliff where they had to hang on by their finger tips. Root soon located a colony of bees in a hole in the rocks, and told the cameramen to get set. Then he removed his coat, bared his arms, lighted a newspaper, blew smoke into the hole, reached in and pulled out the honey, bees and all, without being stung once.

On another occasion Root was giving a lecture and demonstratio night in a town in Ohio, during w he asked for the loan of a hat. stated that he wanted to put bee it, and then place the hat on his h An old fellow on a front seat passe a hat that was badly in need of fum ing. It was sweaty, greasy and d and the moment Root got a smell he knew he was going to have tro with the bees, for bees are very and resent dirt or animal odors of sort. Root did not want to offend owner of the hat by declining to it, so he decided to go on with performance and take the conseque He went through the usual stunt bees and the hat. The bees began t and squeal. They were in a ter rage, and they stung Root some times about the forehead and However, he managed to finish lecture without telling anybody had happened.

Root has been stung so many t that he is practically immune. a bee sting causes him some similar to a pin prick, it does swell. In his travels as a lect handling live bees daily, he will go for an entire season witho single sting.

E. R. Root is the oldest so A. I. Root, widely known as "F Root, the grand old man of Medi whose inventions and discoveries enabled thousands of persons to a profit out of bees. When A. I. died a few years ago, E. R. succeeded him as head of the con and as a world leader in the dev ment of bee culture. H. H. Ro younger brother, is general ma of the company. In the early A. I. Root gave his magazine *Glea in Bee Culture* to missionaries parts of the world.

Are Americans Flattered and Hate

(*Concluded from page 27*)

teacher, spending two years abroad for postgraduate study and a degree, said to me:

"I used to get so homesick, I wanted to run up to any American and ask the news from home. But I have come to recognize groups of my fellow-countrymen at a distance and avoid them. Even so, I do not escape the effects of their coming, for I hear the comments made regarding them by the people of the country where I am, and I have to bite my tongue. I cannot reply, for I know that most of the criticisms are not without reason. We are an uncultured, boorish people, and I do not wonder people hate us."

I have tried two or three times to get the captain and the purser on our ship to tell me what they think about American travelers, but they fight shy. They say, "Some are better and worse, in every country." But be their reticence and their use of g alities, I know they are guarding spoken criticisms.

Travel brings out all latent qua in people. Some people are unse gentlemanly, ladylike, everywhere always. But some who at first aqu ance appear to be so, display, as go on, many unlovely qualities. all, Americans are perhaps as well as we deserve to be. We do not al love the qualities which we see in selves and each other. One greatly wish that Americans trav in foreign countries did more th sometimes done to show America at its best. But I fear that still long time we shall be flattered hated. It were better for us to b buked and loved.

Why Paper Money Is Popular

' was more than a score of years after the close of the Civil War before s country was permitted formally to urn to a coin basis from the paper ndard forced upon it by the money ver. Between the cessation of tilities and the resumption of specie ment, however, several things had pened which enhanced the value of coin dollar, and made resumption of cie payments exceedingly profitable. Among these were the National nk system, initiated before the war ed, it is true, but a practical failure il after Lee's surrender, when bank es were driven out of circulation; s making the principal of the public t, borrowed on a Greenback basis, able in coin—gold or silver—just had been the interest; the demetization of silver, making coin n gold alone—in effect doubling the blic debt.

The Greenback itself is a promise the government to pay in coin, but all money uses was by law made a l tender for all purposes save custom ies and interest on the public debt. National Bank currency and the ntion of silver coin as a token ney made it possible for banks to rd the Greenbacks, and those in know did so until the whole issue in their hands. Then came the cry the resumption of specie payment. For whose benefit?

One statesman, either Simon Cameron or Zach Chandler, had gruffly said, "The way to resume is to resume." No immediate resumption would have answered the query. So the resumption was set for a day when it might be put in force without a jar; for promised resumption meant at least a gradual return of the Greenback to a gold par.

Success of the scheme was immediate, for the increased purchasing power of the dollar, in part due to the demonetization of silver, was attributed entirely to that cause, and we slid upon the gold standard without creating any demand for that metal for money use. The hoarded Greenbacks were put in circulation at a purchasing power nearly twice as great as that possessed when laid aside for "the day." It had been intended to retire the whole issue, making their redemption a cause for renewed borrowing of gold, but the effect was to establish gold values without, and resumption of specie payments was a fact before the law made it so.

So it may turn out in one of Great Britain's dependencies, the Union of South Africa, which established July 1 as the date for going to a gold basis without general notice from the daily press. Professor Kemmerer, economist at Princeton University, was one of a commission to advise the Union parliament, and returned in January after an absence of three months on that mission. On his return, he stated briefly the report of the commission, which has been approved by the government.

The Bank of England, April 28, announced the resumption of specie payments immediately, apparently following the declaration of the American statesman, quoted that the way to resume is to resume. In truth, however, she has been under preparation by a gradual deflation movement begun some five years ago. This antedates an expected resumption at the close of the calendar year, and is made possible by the abrogation of the existing embargo on the exportation of gold bullion which would have expired by limitation on that date.

It is not at all improbable that resumption will be actual.

With all the prosperity that this country now enjoys, why are there so many idle ships? Why is it that the vessels belonging to the merchant marine are not now carrying commodities from sea to sea instead of rotting and rusting in dock? This is an anomaly that is capable of elucidation. Next week this matter will be fully discussed by a writer who has probed it to its depths.

Grotesque Rock Formations

N THE Western trails of the United States are found stretches of ntry lying between the plains and mountains, known as the Bad ds. Here we find the plains have sed and the Rocky Mountains have to come into view. the Bad Lands seem ave labored furiously a vain endeavor to tate the topography both the plains and mountains in one le effort.

The result is exceedy picturesque. Here find some of the ngest rock formations sting anywhere on h. These great rock nations, while lackn the rugged grandeur the towering mounns to the west, nevertheless hold a peculiar rest of their own for student of geology.

Millions of years ago great glaciers came m from the north, eling all before them. They left indelible marks on the conformation of the landscape. The valley of the Mississippi was caused by erosion from these great glaciers. But at the edge of the glaciers the force was less terrific, and many of the more hardy rocks were enabled to withstand its onslaught.

Thus it was that the Bad Lands of the American West were created, today standing as so many grotesque rock formations, enduring monuments of the glacial period, shattered remnants of noble mountains that once were giants. Their edges have been worn away by erosion, and the elements of countless years have battered them, but they stand immobile. Many and varied are the outlines of these interesting rock formations, which are found scattered over the vast territory from Southern Canada to the Gulf of Mexico, predominating in the region closely approaching the Rocky Mountains. Utah and the region to the south, for example, possess hundreds of thousands of acres of these strange rock formations.

Eighty-three Thousand Per Cent Profi

How a Bridge Acquired as a Gift Became a Gold Mine

By SAMUEL DANZIGER

TRAVELERS on the Pennsylvania Railroad between Baltimore and Philadelphia may see, on crossing the Susquehanna River at Havre de Grace, a long and low bridge for vehicles and pedestrians alongside the railroad bridge. Those who travel by automobile not only see this bridge, but remember it as the only place along the highway where the traveler must pay toll. The bridge has a remarkable history. Its recent owners acquired it at less than bargain-counter terms and have disposed of it to the state at a higher percentage of profit than bootleggers charge for their wares.

The bridge was originally constructed by the Pennsylvania Railroad and used for passage of all trains. Later it became necessary to raise the grade making it useless for railroad traffic, so a new bridge was built which is used by the trains at the present day. The Pennsylvania offered the old one to the town of Havre de Grace in return for a new right-of-way to give the necessary approach to the new bridge. But the citizens were canny and thought they could make a better bargain. They declined the gift and insisted instead that certain trains stop at Havre de Grace and carry passengers free across the river to Perryville. These terms were finally granted and the poor corporation was left with a bridge on its hands which no one would buy. Finally, a private citizen in the kindness of his heart accepted it as a gift, then formed the Havre de Grace and Perryville Bridge Company and transferred the property for $700. This took place many years ago in the days of horse-drawn vehicles and mud roads. Travel was very light and toll receipts amounted to little. Residents of Havre de Grace who had business across the river preferred to take advantage of their privilege to ride free to Perryville on the railroad to payment of toll for a two-mile walk.

This state of affairs could not last. It was too utopian—or perhaps bolshevistic. There came the time when Congress forbade the issuing of free passes, and the Interstate Commerce Commission construed this as applying to the contract between the town of Havre de Grace and the Pennsylvania Railroad.

The abrogation of the contract seems to have been one-sided. The citizens lost their free rides, but the road retained its right-of-way. It now became more economical to walk across the old bridge and pay toll, and the toll collector began to have something to occupy his mind besides watching the trains pass by. Then another stroke of good luck came to the bridge corporation. The State of Maryland decided to spend many millions in improving the highways. A system of roads was constructed which has made the state famous and popular among automobilists.

One section of the state highway between Washington and the state line on the way to Wilmington and Philadelphia ends at the Havre de Grace terminus of the bridge; the other begins at the Perryville terminus. All automobile traffic between Washington or Baltimore and Philadelphia and New York must cross this gift bridge and pay toll. Maryland taxpayers have made the corporation rich. Its net profit for the fiscal year preceding sale to the state was $40,000. But there is a rapidly growing sentiment that a toll road is, or ought to be, an anachronism. The Maryland state roads are free, but this bridge, although an important connecting link, was private property up to the early part of 1923. Early the year 1922 the company made kno the terms on which it was willing to s which were not the terms on whic had acquired the property. It as $700,000 for what cost it nomin $700. It asked the state to pay a pr of 100,000 per cent.

The spending by the state of milli of the taxpayers' money on good ro thus made it possible for a corpora to hold it up for hundreds of thousa more. For no more than $200,000 physical property could be duplica The state ha self created additional v by building g roads unless part played the Interst Commerce C mission in pro-railroad cision be cor ered a fac At any rate company ha moral claim.

However, only the br corporation alleged "re sentatives of people" bel such a ho ethical. A authorizing chase on the poration's terms and carrying the essary appropriation came before legislature in 1922. The state se slightly reduced the price, makin $690,000, and passed it in that sh The house amended it so as to auth the State Public Service Commis to close the deal and so it bec law.

The record of this commission di justify confidence in looking to it curb on corporate rapacity. In case, however, it was not quite so placent as its history had led clos servers to predict. It let the m rest for a few months, then held a surely hearing and finally induced corporation representatives to cor themselves with a smaller profit. stead of 100,000 per cent they ag to accept a beggarly 83,500 per The sale price was fixed at $58 and on these terms the deal has through.

This whole affair would be laugh if it were not an illustration of a spread evil, the almost universal ing of tribute upon the people by nopolizers of unearned increment.

Vehicular bridge over Susquehanna River at Havre de Grace, Maryland, acquired by Havre de Grace and Perryville Bridge Company for $700. Bought for the state by Public Service Commission for $585,000, the state thus paying for a value it had itself created.

"I Read *in the* Papers—"

ad in the papers that the Mak- Dam of the Nile in the British an, the greatest water barrier in the ld, has just been completed, seven ks ahead of time. This dam will nit a huge area of land to be used he production of cotton under ideal litions with native labor. The erican cotton-raising industry was nded upon cheap land and Negro es; the industry has since flourished use it constituted a world monoply. erica will now face the first real lenge to her supremacy as a cotton lucer under the very conditions that e given us our hitherto advantages.

ad in the papers that the Farm eau Federation has interested itself eviving the old-fashioned Fourth of picnic. The fact somehow brings p with a start to a realization that old-fashioned picnic *has* disap- ed. In other days everyone hitched went to a grove by the pond, had et lunch, played games and lis- d to the "orator of the day." I sus- the latter had something to do with disappearance of the picnic. What e futile utterance can be imagined the latter Fourth of July speeches? yet what day was more fitting for l to think upon our national founda- s and confer about our national olems? The Farm Bureau people that if the Fourth of July can be ued from banality by making it preëminently for farmers' picnics rein men of ability and vision can e real speeches full of meat, a good shall have been done. We agree.

ad in the papers that a corres- lent of the *Christian Science Moni-* studying the effect of our immigra- law abroad, remarks that the les who wait at European ports are most revolting people in the world, arently suffering from dire poverty, yet able to offer as much as $1,000 raft for a passport visé. He re- ks the overwhelming preponderance ws among them, and the suspicious mstance of hundreds of them turn- abbis overnight, to get in under the essional classification. Most of e, he says, cannot return to the ntries whence they came, because e countries are only too glad to be rid em. And as to Jewish Palestine— leads the world in refusing admit- e to Jews! The United States is itantly abused for not admitting n, which seems rather unfair when astine itself refuses to have any- ig to do with them. Yet collections still being taken in America, huge s raised, to support those great groups which appear to be so poor and which yet have all sorts of money for graft and traveling expenses.

I read in the papers that the ideal of the Big City is beginning to slump. With enough transit trackage within her limits to reach to Chicago and return, New York can't take care of her suburban passengers. Elevated, surface, subway and bus lines; trains leaving every minute or two, bus room for hundreds of thousands of people—and still the congestion is terrific, becoming worse. Three hundred millions must be spent on new subways during the next five years, and these increased facilities for escaping from town will take care only of the natural increase in the number of passengers who will have to be carried; the congestion, after the money is spent, will be precisely as bad. A limit may be reached beyond which it will be impossible to go. Have to stop packing them in.

I read in the papers that we spend our lives feverishly, and what we really need is the leisure which breeds thought and the idleness which brings a sense of proportion. The reaction may have already set in in the return of dancing London to the old-fashioned waltz. Time to think is one of the great needs of the present day. There has arisen an indolent mentality that "can't be bothered" thinking. It is being observed, especially in young people, that some will do almost anything to escape the trouble of thinking. In this way the intellect becomes flabby and the power to do the right thing at the right time is atrophied. The revival of the old-fashioned waltz may be symptomatic of a return to sanity. For the old dances required, at least, a little application, a little discipline, a use of the mind.

I read in the papers that this is "the age of extremes" in the region of art. This may be true, but there have been extremes in art, as in most other things, at all times. The pre-Raphaelites with their meticulous adherence to detail are but a memory; the impressionists, with their broad effects of atmosphere and color, have had their vogue, and then there have been, and still linger, our cubists and futurists. Was it not Ruskin who, seeing a picture which was creating a sensation at the Royal Academy exhibition, said that the artist had "flung a pot of paint in the face of the public"? Since Ruskin's time many pots of paint have been indiscriminately flung about; for a day or two the resulting splash was called "genius."

Cancer Can Be Prevented

(*Concluded from page 4*)

medical world has striven harder and harder to discover the cause and cure. The laboratory workers have had long innings and they have very little indeed to show for it.

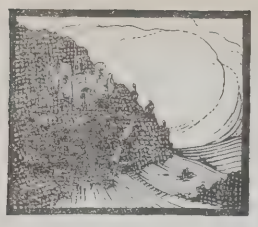
Meanwhile, the indications of what causes cancer may be found, by inference, among the uncivilized tribes of the earth. We have simply been studying germs when we should have been studying diet and drainage. What good would it do to discover the cancer germ? Have we not already discovered the germ of tuberculosis, without thereby removing the disease? We have minimized tuberculosis only to the extent that we have minimized the operation of its causes. We know now that sunshine, fresh air and good food are fatal to tuberculosis. Knowing these things, we need not worry about the germ that accompanies the disease.

There is so much proof that savage peoples have neither cancer nor any of the other diseases of civilization, and that their dietary habits are the cause of their immunity, that one might fill a book with it. Dr. Hoffman, the American statistician, who has investigated the subject perhaps as much as any man in the world, writes me as follows:

> "Your views regarding dietary or nutritional causation (of cancer) coincide with my own, based upon extensive research among native races. I recently returned from a trip to South America, where I lived for seven months among native Indians and mixed bloods. During the entire period, not a single case of cancer was brought to my attention, although everywhere I inquired—although every doctor was asked the question; and although personally I came into contact with more than 2,000 natives. The diet is very simple, and the habits of the people are very regular."

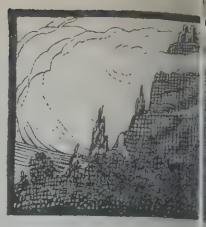
The world, in its search for the cause and cure of cancer has been on the wrong track. The answer has been within ourselves all the time. Drain the body of its poisons, feed it properly, and the miracle is done.

Chronic cancer cannot be cured. Neither can any chronic disease. But cancer can be prevented, as can all other diseases that arise from the same cause. On these statements I am willing to stake whatever reputation I may have. Nobody need have cancer who is willing to take the trouble to avoid it. And he will feel better and enjoy life more all the time he is taking the trouble. Incidentally, he will live longer.



Castles in Spain

Things That Have Influenced American Architecture



THE French invented the phrase "Chateaux in Spain" to indicate air castles on the assumption that there were no chateaux in Spain. True, the Spanish with their Moorish traditions employ the term "alcazar" for castles that the French call chateaux; however, the alcazars of Seville and Cordova and the fortress-palace of the Alhambra are combinations of military strength and architectural splendor that are unsurpassed in France.

Perhaps it was envy as well as passion that caused the French upon their expulsion from Spain in 1812 to blow up part of the Alhambra whose total destruction was only averted by accident, and also seriously damage other gorgeous Iberian structures.

Although the Alhambra is conceded to be the finest architectural monument in Spain it possesses many other notable examples of the combined labors of the architect, sculptor, and artist. There is nothing commonplace about Spanish houses; many are dead, but they "died in beauty."

Our present interest in Spanish architecture is that it shares with the so-called Colonial the distinction of being the inspiration of more good recent American residences than all other styles. As a sequence one notes that the importation into America of Spanish antiques to furnish these new houses now almost equals the quest for old English and American furniture.

The riches, physical vigor, and intellectual zest of America have made us the premier builders of the world. We originated the skyscraper and such masters as Cass Gilbert have made of it the most distinctive large building since the medieval cathedrals. The world likewise concedes us preëminence in domestic architecture.

Our architects and their clients have not been either national or provincial in their search for style; they have courageously tested out the best that the whole world affords and evolved out of it real American architecture. At the same time we frankly and freely concede such foreign influences as English and Spanish, for example, as well as other sources.

The strength and charm of Spanish architecture, sometimes termed Mission in American, has chiefly been utilized in residences in California, the Southwest, and Florida. A poor beginning based upon the old Spanish missions was made. Although a few of these missions are good specimens of Spanish architecture, trained architects and a better acquaintance with a greater variety of Spanish examples was necessary. This has been achieved and the poor start has been brilliantly retrieved.

Toledo, the Rome of Spain, and Andalusian Seville, Cordova, and Granada have supplied these examples of Spanish buildings.

Crowned with the glorious Alcazar and resting on steep granite hills, Toledo stands as though rooted in the rocks. Two gigantic and spectacular bridges, the Alcantara and the St. Martin, span the deep Tojo valley that almost encircles the elevated town. The whole town, the most Spanish of towns, seems to be in a fighting mood. Huge gateways and towers, the houses fort-like, the doors studded with heavy nails. The world-famous cathedral of the primate of Spain is even surpassed by the church of El Cristo de la Luz, a bold and brilliant cabinet piece of Arab construction.

The grandeur of Cordova culminates in La Mezquita, the cathedral. It is a reconstructed mosque and in size is only surpassed by St. Peter's in Rome. Although its pristine beauty was lost during the Christian alterations, the cathedral remains one of the world's notable buildings. Like Mark's in Venice, La Mezquita is assembled collection of architect loot; tangible evidence that the M and Christians brought home bacon from conquered cities.

Seville, known as the town of br courtyards, was the birthplace Velásquez and Murillo, the pain and it is the scene of these fan operas: Bizet's "Carmen" and Moz "Figaro" and "Don Juan."

The Giralda, a Moorish brickv tower 305 feet high, that has altered into the bell tower of the ca dral, is the best-known structur Seville although the Alcazar is se only to the Alhambra for architect worth. Giralda is the Moorish tern weather vane. Stanford White the Giralda as the model for the t of Madison Square Garden and Saint Gaudens model a figure of D to move with the wind; the Giral surmounted with a figure of Faith

The palace of the Duke of Os from which a scene is shown, is a s place of Seville. It is in the Mudejars

The Alhambra at Granada i well known as one of the no groups of buildings in all the w that the picture is sufficient. fortunately the engraving does include the white Sierra Nevada, than two miles high, that are v to the south beyond this pic Americans can take proper prid the fact that it was the timely wri of Washington Irving that awak world interest in the Alhambra saved the remains of French explo and Spanish indifference from f into complete ruin. The Moo architecture distinguis Spain is an e tion of Byza architecture, the Mosqu St. Sophia.

Americans, greatest travel well as builders the world now sesses, would b inspired to f in the footste Washington I and Ralph A Cram and ex Spain in searc only of architec treasures but for the cou other features make the Ib peninsula dis tive.

CHRONICLER OF THE NEGLECTED TRUTH

BRIEFLY TOLD

In the late war, when the American commanding officer of a western regiment found the Germans tapping an American telephone wire he detailed eight Indians to transmit orders in Choctaw which completely puzzled the Kaiser's best linguists and language specialists.

Bear traps, with rubber-padded jaws, are proposed by an Oregon trapper as a means of catching burglars and sneak thieves operating in the darkness. The trap will not break the leg but will hold despite all struggles.

A Tennyson room in a new museum in Lincoln, England, will be exclusively devoted to books, pictures, and manuscripts, and such of the poet's personal possessions as can be got together.

A correlation machine, with fewer parts than a typewriter, driven by an electric motor, has demonstrated calculations in ten minutes, which task formerly took two hours.

The infant death rate varies inversely with the earnings of the father, according to data furnished by 23,000 babies in eight American cities.

The mayor of Holloway, Ohio, a woman, tendered her resignation, declaring the office interfered with her home work.

A homing pigeon won a race between Paris and Brussels against an airplane.

The Boston and Maine Railroad has announced that it will inaugurate a system of "store-door delivery" at Boston, Lowell, and Lawrence, whereby merchandise will be picked up at the door of the shipper and deposited at the door of the consignee as a complete transportation process utilizing railroad and motor truck.

The hot dog—a distinctly American institution—has invaded Japan, and is meeting with high favor.

A bee may live as long as 68 hours after losing its stinger in stinging a person, but the average period is from 10 to 15 hours.

America's cigaret gain last year was 11 per cent, or a total consumption of 70,000,000,000.

Glasses are worn as a badge of superior social status in certain parts of China, frames without lenses often being worn.

Benjamin Franklin was for nearly forty years connected in some capacity or other with the Post Office Department.

Busts of two women, Charlotte Cushman, actress, and Harriet Beecher Stowe, novelist, have been unveiled in the Hall of Fame.

Wild turkeys are to be introduced into Oregon, a section of America to which they were never native.

Saxophones are driving out the bagpipes in Scotland. Music instrument dealers of Glasgow report an unprecedented run on saxophones, and several declare they have not sold a single bagpipe since the jazz tunes and the saxophones took the city by storm.

A single pocket gopher caused a break in an irrigation ditch in Arizona which cost $2,000 to repair. Where 156 miles of ditch bank was treated with poisoned sweet-potato baits more than 90 per cent of the pocket gophers were killed.

"The airplane is the most offensive weapon that has ever been invented. It is a shockingly bad weapon of defense, but it is the only defensive weapon against the airplane. Think of the cost of the few squadrons necessary for an air defense, as against the cost of any other means."—*British Air Chief Marshal Sir Hugh Trenchard*, in an address to the Cambridge University Aeronautical Society.

The first piece of gold found in Australia was discovered by a native, a bushman, who, seeing his master counting sovereigns, brought in a lump of Golconda weighing 106 pounds, and valued at $24,000.

British actors must not use the word "bloody," by ruling of the lord chamberlain, who censors plays in England.

Cases are on record in which collie dogs, missing one of a flock of sheep, have gone back and hunted it.

Cuban fleas, emerging from a package opened in the Dead Letter Office in Washington, swarmed over desks, files, and the clothing of the employes until it was necessary to exterminate the pest by means of fumigators.

A natural enemy of the locust has been found, a true insect which pursues them on the wing, depositing eggs within the locust's body. These eggs later hatch into maggots which kill their hosts.

The Navajo Indians kill a horse at the grave of a newly buried comrade that he may have a means of conveyance in the happy hunting ground.

The Oriental fruit-worm, Japanese beetle, citrus canker, potato wart, European corn-borer, camphor scale, and the gypsy moth all came in during the period of four years (1909-1912) which it took, on account of opposition, to secure a Federal law to put some check upon these pests.

John Quincy Adams, when President of the United States, swam in the Potomac in the early morning nearly every day in summer.

Mongolia shortly is to have its own money unit, the "Tugurik." It will be equivalent to the Soviet gold ruble.

The revival of the homespun industries in India promises to restore the lost art of making the Dacca muslins which were so fine as to be almost invisible.

Certain Indian squaws divorce their mates by placing the man's shoes outdoors.

Presented in This Issue

Mr. Ford's Page this week sounds a timely warning concerning possible abuses of the new freedom which has been accorded American business. (p. 11)

Our laws are made by Congress and legislatures, but we are governed by bureaus. They begin innocently enough and presently are giving orders to the government. Practically every misnamed "welfare" movement, sponsored by political women who misrepresent the American Woman, is working for more bureaus. How some of these bureaus have grown is told by a Massachusetts woman who knows. (p. 15)

From mine boy to the Presidency of the American Council of Churches is the record of Samuel Parkes Cadman, preacher, lecturer and author. He thinks the church will have to take to the road again. With all his fame and aristocratic connections, he is still a street-corner preacher. An interesting personality article. (p. 3)

For a long time this paper has conducted weekly "Seeing America" tours in its pages. Our country is so rich and varied in its attractions and wonders, that it simply cannot be ignored. Ipswich of the Dunes makes an interesting little trip via print this week. (p. 21)

Have you fallen victim to the South Sea literature? Well, you have probably sensed that the reality cannot be anything like the authors write. And it isn't. Normal people like to look at it and come away. Like the desert sheiks, the South Sea atmosphere repulses. A well-balanced newspaperman went down there to see. His reports are reliable. (p. 7)

Few writers can recreate the old South through the medium of the present South as can Harry Barnet. His article this week on old Natchez is interesting. Readers will remember his splendid article on "Natchez-Under-the-Hill." (p. 30)

What do you know about the earthworm? Do you know that the Earth, as a planet, could more easily dispense with mankind than with the earthworm? He is a wonderful creature and absolutely essential to the sweetness and fertility of the soil. A really worth-while article is this by Mr. Du Puy. (p. 22)

Kansas has always been noted for its independent editors. They have owned their own papers and owned their own souls and have spoken their minds without fear, save of God. A race to be proud of. Mr. Chase is an authority. (p. 24)

Joanna Southcott's Box has been a poser for the Bishops of England. Over 100 years ago this Prophetess left a box supposed to contain messages for the present generation. But it was not to be opened unless 24 bishops were present. The bishops have thus far refused. It is one of the curious stories of the time. (p. 18)

American shipping — the story has lost its public interest; still, someone must be able to discuss it intelligently, and if that happens to mean you, here are some facts. (p. 4)

The romance of rascality has never been better handled than by Mr. Finger. But Thomas Lodge was not a rascal nor a rogue. He was probably the creator of what later became Shakespeare's play, "As You Like It." And after his roving days were done, he studied medicine and fought disease. One of the most likable and honorable of this series of "rascals." (p. 16)

On the Road of the Charcoa

Romance in the Wake of the Charcoal Carriers in Sunny Spain

By V. S. PRITCHETT

THERE is a cold damp smell in the house of Dona Luisa, a smell of lunch time's olive oil, a smell of cold food, a smell of charcoal burning. As you walk across the cold tiles of the hall you see through a doorway the figure of Dona Luisa. She is stirring up the charcoal until it crackles and glows in her *brasero*. She replaces its brass cover and puts her feet on it. In half an hour you will be driven out of the house by the fumes and will meet on the stairs the man bringing more charcoal. She will sit there and sleep while a corner of her skirt smolders mildly.

The charcoal man gets his yellow basket of fuel from the passage next to the café in the next street. The man in the passage buys it from a man who has a bigger passage and a cellar. The man who has a cellar buys it from a countryman. Forty miles of naked road within a cold blue horizon rim of iron plateau and shattered mountains, the jolting mule teams creak and jingle, with a dozen yellow baskets of charcoal piled upon them, and six or seven lambs thrown on top by a peasant who is going the same way. There are no trees. There is scarcely any thicket. The earth is bare, straw-brown, cold, red, seared with blue, and the basin valleys of the water-formed hills are purple with shadows and have a beard of frost. A whip cracks. It is the wind. Forty miles the mule teams straggle, bumping in the flat country, straining up the slopes, and sagging down again, the driver using a pine trunk for brake by fitting it on the hub of the wheel. At the top of the pass tired teams are resting, oxen unyoked, mules unharnessed, the drivers stretched full length on the frozen grass. Above is the stinging, candid blue of the sky softened by the flowing silver of the sun. For forty miles teams pass, and shepherds in sheepskin coats, fur hats and corduroys, their trousers bound up to their knees with crude leather strapping, stand on sudden eminences. On the few green hills goat bells are tinkling. The teams pass lonely men on donkeys, stepping with the lightness of solitude. Wilder, gayer men pass galloping their ponies. There are ponies carrying sacks of linen and meal. There are black donkeys and gray donkeys walking graciously with a load of sticks. For forty miles the little journeys and the big journeys meet and pass and mingle.

This is the road to France, but France is hundreds of miles away. This is Castile. This is a naked road, serpentine, rising and falling as though Castile were the back of a gaunt-boned animal. Sometimes it is a curving white road, sometimes a road like a bent wisp of straw. At sunset it is a rose-gold road and the ruts, the hoof marks and the footprints are strokes and wells of cobalt. The mountains behind are stripped of color. The scant cold shadows lie quietly on them. The mountains are like gaunt-boned pack mules and are carrying the first loads of snow on their backs. A great limb of the first range steps back and far away down into a welter of hills. In a hollow, in the blue print of the hoof, trembles a little town.

The teams of the charcoal carriers stop in this town by the church where there is an open place. There are half a dozen shops here, a *fonda*, a *venta* and a *posada*. In the *posada* the carriers go and sit on benches and drink. They talk in big open voices at one another about important things. They talk about their mules and about other people's lambs and goats and crops. They talk about their families and the trouble that is in them. They talk about the cobbler who died and the baby who was born. There is the smell of rope and wine and oil and dried fish and wood in the *posada*. There is a dog asleep on its stone floor. A driver kicks it and it gets up and runs cowed to a corner. The drivers laugh and spit. All that matters are the animals that li and the people who die and the babi who are born. As the drivers sit ou side on the stone bench of the *posa* they fall asleep in the sun or le against a doorpost and sing two lin of a tuneless song.

The little town is on the cliff of gorge. A river holds its mirror, strean over a weir, runs halfway round, hol the mirror again and then makes for t open country. The town is surround by a wall. It was built by the Moo Someone's washing is flying in one their horseshoe arches. The little to is bare, brown and crumbling. houses are falling to pieces. Its chur makes a show of standing bravely. T sideways are heaped with stones a boulders. One climbs from one cotta to another and sees the old Moori walls standing round the town wi only young cockerels and nimble goa and groups of children to defend the The oxen go through the gate and do to the stream to drink, in a stream on red with the blood of a Moorish sort Where the women are washing t white clothes where the river is shallo est, the twang of the bows and hum the arrows were loudest. N the women sing unfinished vers about forsaken lovers and t about the news of the tow Over the deep arch of the brid and up the path to the archw through the walls, a woman shouting at her donkey and be ing it. Two black donkeys a nibbling the turf by the ga There is frost on their noses a as the woman passes they bell jeeringly. It is the only ch lenge.

The honking of a motor ho sounds in the street. There the roaring and sputtering of engine, the cracking of ice in puddle and a general scurry chickens, goats and pigs into t square by the sun-dazed chur The Madrid omnibus is comi The omnibus is white with d and gray with drying mud. T smell of petrol is unusual in t little town. The omnibus is f of peasant men and women, their gloomy black clothes a green scarfs. The omnibus h stopped its engine and is surrounded the curious who step out from the do ways. A man trots down a sidew on a pony. He is carrying a wood trunk painted in red and yellow a blue. He shouts, "Asuncion, where thou!" He is Asuncion's brother a he pitches the trunk from the pony the top of the omnibus. Asuncion is her best black clothes and is weari fierce and heavy ear- (Concluded on page)

The Roosevelt of Religion

Dr. Cadman at Sixty Years a "Rapid-Fire" Preacher and Avalanche of Energy

By WILLIAM L. STIDGER

MIDNIGHT, an automobile breakdown—and with it Dr. S. Parkes Cadman.

And what two preachers on't know about the mechanics of an utomobile is enough to fill a diction-y. They were ten miles from Wilkes-arre, Pennsylvania.

The headlight of another machine ove into view. It came nearer, nd stopped. A voice from the range machine called out a uery as to what was the trouble.

"We don't know what's the atter. The blamed thing just on't go!" answered the voice of r. Cadman through the night.

An excited man climbed down ut of the rescue car calling as he ambered across the road, "I now who you are. You're Dr. adman. I've heard you over the dio so many times I'd know at voice anywhere."

He was right. The two met for e first time on the hills at mid-ght.

Which is illustrative of the w power that this man, Dr. S. arkes Cadman, has through a radio udience that is conservatively timated to be 2,000,000 in umber, which listens to him every nday afternoon, as he broad-sts from the Bedford Y. M. C. . in Brooklyn. He already had a tional fame through the publi-tion of his addresses in the rooklyn *Eagle*, but the radio gave m an almost national personal earing.

Dr. Cadman has just sprung to the focus of more spotlights than er before, perhaps, shone on a inister. Overnight one discovers that is man has assumed so much im-ortance that personality articles, life etches, and stories of and by him are ppearing everywhere. One month's op of magazines contained eight ticles about Dr. Cadman.

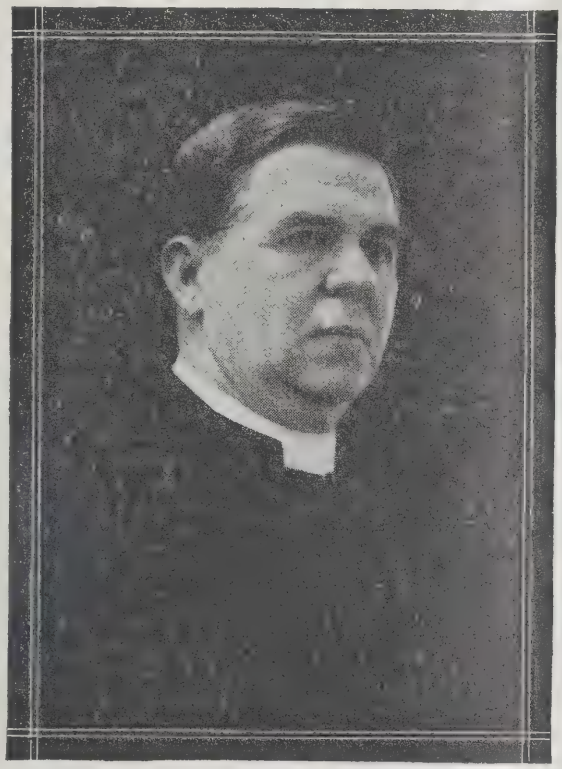
And yet there has been nothing dden about this popularity; it has me about through a long life of hard ork, strenuous effort, and great prep-ation.

In one of his question-and-answer eetings, for which Dr. Cadman is mous, he was talking, as is his anner, with great vehemence about me labor problems, when an ex-ted man in the audience jumped to is feet and yelled at the speaker:

"What on earth do you know about bor, anyhow? You never did a day's ork in all your soft life. You preachers ake me sick. Every one of you live ft and easy lives. You have a snap."

Dr. Cadman let him have his say, nd then, with a Chesterfieldian grace and consideration, he said to the man, "Just sit down a minute brother and calm yourself. Then I'll tell you something."

Then Dr. Cadman, who has recently been elected president of the



DR. S. PARKES CADMAN.

Federal Council of Churches, the highest interdenominational honor that can be offered a minister, told that man and that audience how he had worked as a boy in the coal mines of his native land, England, from 4:30 in the morning till 8 o'clock at night, for eight years, starting at the tender age of ten years. He told it briefly, but graphically, and his realistic story of a ten-year-old boy, sorting slate from coal until his hands bled every day, laboring in the darkness five hundred feet under the earth, quieted this obstreperous brother who felt that all preachers talked from mere book-knowledge when it came to labor.

"So you came from a generation that knew what real work was?" I put to him by way of a question in my interview.

"My father held out no special inducements to me and offered no promises as to my future. In England, you know, they don't play up the throne to youthful Briton, as they do the Presidency here, probably because the throne is already occupied. No, my father didn't believe in patting his sons on the head and telling them they would be great men some day. His was a sink-or-swim policy, but for those who survived it was sure to indicate habits of hard work. And, after all, here in America, even in this land of democracy, say whatever you like, there is no open road from a log cabin to the White House. Necessity is still the best spur."

It is because of this background in training that Dr. Cadman will inject a new spirit of democracy and social justice into the life of the Protestant churches of America, whose executive he now is.

A note of this spirit crept out in a sentence spoken while we were riding down Fifth Avenue from 89th street the Sunday afternoon I interviewed him.

"*I sometimes think the church will have to leave her gorgeous palaces and take to the road again.*"

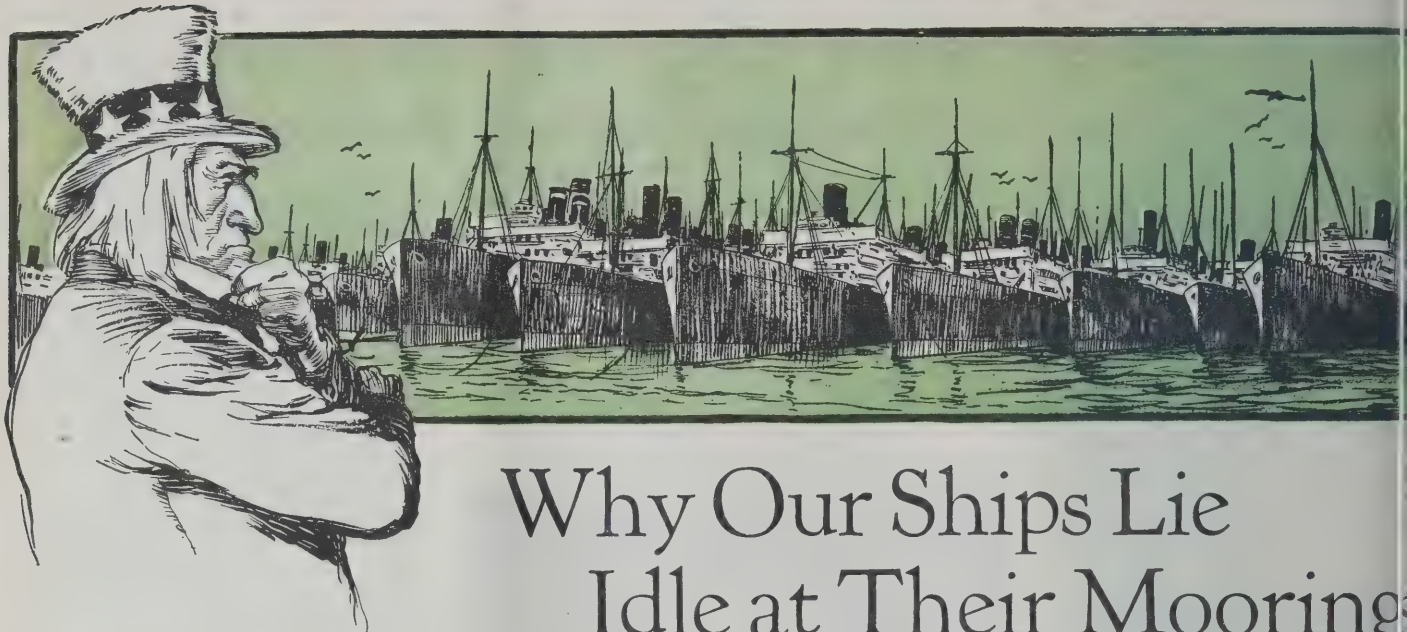
"Just what do you mean, Dr. Cadman?"

"I mean that she will have to get down among the lowly and the outcasts, the thieve and adulteresses; the sinners, and the sick, as Jesus did."

Dr. Cadman himself knows what it means to take to the "road again." In the days when he was the pastor of the Methodist church in Yonkers he used to go out on the street corners to the crowd that never went into a church. He was a pioneer in this type of ministry in the United States. His audiences used to get so enthusiastic over this type of preaching that they would shout questions at him, either friendly or critical questions, and he would answer them. Often these periods of questions and answers would take longer than the sermon. That was the beginning of his famous ministry of the Question Box.

To see him in action in one of these famous, catch-as-catch-can Question Box periods, I went to the 57th Street Y. M. C. A. in New York City one Sunday afternoon in May. For more than ten years Dr. Cadman has conducted the May Sunday afternoon meetings in this New York Y. M. C. A. The rest of the year he speaks in the Bedford branch of the Y. M. C. A. in Brooklyn.

After a vigorous, versatile, scintillating address he spent twelve minutes in answering questions. They were shot at him like trip hammers, and he answered them like a machine gun in action. Not a wasted minute or second. Answers clear and (*Concluded on page 23*)



Why Our Ships Lie Idle at Their Mooring

By CHARLES ALBERT COLLMAN

A NUMBER of gentlemen—seven of them, to be exact—who are accustomed to meet in council at the Navy Building, in the board room of the U. S. Shipping Board, Eighteenth and B streets, Washington, D. C., are facing a problem singular in its complexity; not that the difficulty in itself is insurmountable, but that selfish interests hinder and confuse the matter; and, as usual, those who are most concerned in its solution, the merchants, the farmers and the manufacturers of the country, have had the least to say.

The matter deals with the future disposal of the great fleets of steel ships, both cargo and passenger, owned by the United States through its Shipping Board—an aggregate of 1,236 vessels.

To preserve the mercantile navy, the United States, through the Shipping Board, has developed its shipping business and established trade routes. It has devoted millions to improving port facilities upon the Atlantic and Pacific oceans, the Gulf of Mexico and the Great Lakes; for successful shipping needs much besides water craft; without deep water and good piers in convenient places, there can be no mercantile fleet worthy of the name. In recent years American ports have been improved on a scale to be comprehended only by comparison with the water fronts as they existed in New York, Philadelphia, Baltimore, Norfolk, New Orleans, Seattle, Buffalo and other cities in 1914, and with their appearance today. Without this constructive outlay, America would be as conspicuous for her absence upon the ocean as she was in 1914.

Had it not been for this costly and unremittant work, the present discussion of the public or private operation of our merchant ships would not be heard; in fact, there would be no operation whatever. But fortunately, of the 1,236 Government-owned vessels, 344 are now being operated on specified trade routes by the Shipping Board through its Fleet Corporation. Few persons have a conception of the vast carrying-trade afforded by these ships. Schedules of their sailings in general cargo, passenger and mail service include the United Kingdom, the Bordeaux-Hamburg range, Scandinavian and Baltic coasts, the Portuguese and Spanish Atlantic, Mediterranean, Adriatic, Black Sea, Levant and African ports, and the service to the West Indies and South America. Other fleets cross the Pacific to Hawaii, Japan, China, the Philippines, Straits Settlements, Dutch East Indies, Australasia and India. *While many of these vessels are not yet profitable, being operated by agent companies on a cost-plus basis*, nevertheless their apparent losses are said to be more than offset by their benefits to American overseas trade, and they have pioneered the United States flag into ports where theretofore it had been noticeable for its abse

Deducting the 344 operated s from the entire fleet of 1,236, t remain 892 vessels, which are all and laid up in various places; 247 a the New York district; 101 of them at Hog Island, Philadelphia; 393 the James River in Virginia; 109 in Gulf, while the remaining 40 located on the Pacific Coast.

These 892 ships, swinging idle impotent at their moorings, rusting hulls and partly disman fittings, lashed by chains in clo packed groups, present melanc spectacles to those who happen view them as they lie off shelt coasts or in inland waterways. T represent a heritage from the

The idle fleet on the Hudson River, at Caldwell, New York.

T. V. O'CONNOR, Chairman of the U. S. Ship Board.

war; hundreds of them, when refi may prove of service to our merc fleet; other hundreds, again, ar only for the scrap-heap—hastily ricated vessels, never of much prac

use, which have made money only for ship contractors in war time.

These ships call for incessant care and supervision; rust must be scraped from their sides, the hulls must be repainted. The latest report of the Laid-Up Fleet Division has advised the Shipping Board that the lay-up expenses for the above vessels for the ten months from July, 1924, to April, 1925, inclusive, show a maintenance cost of $2,289,143. This sum is divided into costs for wages, food, fuel, port charges and other expenses. The item for wages was $1,373,375; for food, $329,481; for fuel and water, $250,464; and for stores, $211,260. In the ten months involved there were 268,617 ship days, and at that rate, the average cost of laying up a vessel for one day would be approximately $8.50.

It is these ill-fated 892 ships, swinging at their anchor chains, about which rages the storm of arguments, discussions and representations. What is to be done with them? Who will take them off the hands of the Government? Who will essay the venture of operating them on the seven seas? Who is willing to pay for the job of dismantling hulls and fittings into the junk-heap?

The man who has been called upon to shoulder these problems is Mr. Thomas V. O'Connor, Chairman of the Shipping Board; four years ago he was appointed to the Board by President Harding; last year he was designated Chairman by President Coolidge. Mr. O'Connor began his working life on the Great Lakes, which is in many respects as busy a shipping place as there is on earth; he has been fireman, engineer and captain on a tug; aside from the authority that has been conferred upon him, his peculiar experience in the shipping world gives poignancy to his views on the proper solution of the future of our mercantile marine.

When I met the Chairman in the Shipping Board offices, I found him exercised over an incident of recent occurrence. A shipowner, known and established in the business, had come to him with an offer to buy 18 of the Government vessels, which he was capable of utilizing successfully in the interest of American trade. The deal called for approximately $1,095,000; his available capital was $500,000; and yet he could not obtain the Shipping Board vessels because the New York bankers on whom he relied had so little faith in an American merchant marine that they refused to loan him an aggregate of $3.50 a ton upon tonnage in which he was investing $7.50 a ton. The bankers would not advance 40 to 45 per cent on the security of Shipping Board vessels to further United States trade.

"American bankers," was the emphatic statement of Mr. O'Connor, "are not willing to make loans or to give any encouragement to the upbuilding of an American merchant marine. The enemies of our merchant marine are the friends of foreign ship interests. They know that if a ship is tied up here, a foreign ship is immediately made ready to go upon the oceans. A man sometimes finds it better tactics to condemn what he does not like than to praise what he does like. A booster of a foreign merchant marine would not be heard or read with patience upon American soil. Friends of a foreign merchant fleet, therefore, find it to be good tactics to attack our merchant marine. Wherever they can get it printed, they constantly speak of our national loss in keeping up our merchant navy.

"'Loss' is not the proper word; the proper word is 'cost.' Does anyone refer to Government money spent on railroads and highways as 'loss'? No, they call it 'cost.' They know that by saving that cost we would suffer a loss. We boast of our highways as one of the wealth-producing properties in the nation.

"The bankers," said Mr. O'Connor, "who are disinclined to finance purchases of Shipping Board vessels for operation, are nevertheless quite content to provide funds for their scrapping; I am informed that banking funds of $2,000,000 are ready for such a purpose. Now we have over twelve hundred ships; 400 of these could be kept for operation, 400 kept in reserve for replacement and the remaining 400 scrapped, because the last-named can never be profitably used. Every shipping man knows this to be true; events may change these figures. The postponement of the scrapping of obsolete ships at sacrifice prices has been urged at different times; but it seems to me that the continuing expense of maintenance and the lack of prospect that these ships can be sold for operation are reasons enough for immediate action. There is no evidence that property of this character will increase in value, and we know that depreciation is as sure as the calendar. I am in favor of a sale in large lots or in small lots or both. Speed is the thing desired. Yet rather than see any usable ships sacrificed, I would even be willing to sell such at scrapping prices if responsible purchasers would Dieselize and operate them. Nor am I willing to see the trades which manufacture shipping

Circle—The *Ice King*, refrigerator ship in the Hudson River.]

parts embarrassed, and I would favor making a proviso that, in scrapping, such parts should be reduced to the original iron, steel and brass, instead of being flung upon the market.

"In considering the scrapping feature of our sales problem, it must be borne in mind that a sale must be advertised by law; bids will be examined upon their merits, and the amounts will be made public. I am for the best bid for the most ships. The Shipping Board is the sole judge of what ships it is willing to sell for scrap and what ships it is willing to sell for operation. When we designate ships for scrap, I hope that they will be sold and sold in large numbers with no waste of time. To keep useless ships longer is an insult to public intelligence.

"In selling for scrapping, the information we seek is what a bidder will give per ton; how many tons he will take; how he will make his payments and when he will take the ships off our hands. In selling ships for operation, additional questions are involved, such as what improvements he will make; on what routes he will operate the vessels and for how long he will guarantee to continue operation under the American flag.

"For nearly fifty years, ships of other nations have been making enormous fortunes for their owners, and during that time America has been the most important shipping station on the face of the globe, and the freight money has come out of us. It has been subtracted from a bale of cotton and extracted from a bushel of wheat. It has been added to every kind of cloth, cotton, silk or wool, that has gone into a dress or a suit of clothes. The carrying item is one of the big items of cost; seed-wheat makes a big bill of cost for the farmer; plowing makes another big bill; planting makes another; threshing still another; hauling makes another. And hauling wheat to Liverpool makes a bigger haul than any of them. It

One of the 129 idle ships of the U. S. Shipping squadron in the Hudson River at Caldwell, New York.

may be said that most of our wheat does not go to Liverpool. My answer is, throw back upon us the wheat we send to Liverpool, and see where the price of wheat goes. A drain pipe may be very small, but plug the drain in your bathtub and see what happens.

"In the past year South America has ordered locomotive engines on an enormous scale. In years past, a freight of $4.00 a ton made American competition in this market absolutely impossible and all of these engines were bought in England. An American locomotive had to be shipped from here to England and from England down to South America. At the present time, with our American ships, we have direct routes from Atlantic ports to Rio de Janeiro and Buenos Aires. The result is that South America now buys most, if not all, of her locomotives from this country. The profits to American manufacturers run from the finished product to the mine, and the enlarged pay roll runs also from the locomotive works to the mine. The

Idle ships anchored off Staten Island, New York.

money spent for ships, by wa of the United States Treasur is quickly returned to the pock of the American taxpayer hi self, and what, as I have sai is frequently called loss, wou truthfully be called a small lo and a very large citizen profit.

"We as a nation are commi ted to the policy of individu ownership in business enterpris We do not want the Governme in any business if that busine can be taken over by men wh will run it with the care, indust and economy generally used b a person who is spending h own money.

"I am always in favor selling to a private operator if believe that he can stick it ou By this I mean stand t fighting of the foreign compani who have been in the shippi business for centuries and wh would cut rates until compe tion was destroyed and th raise them again. I want to find operator to take the job over, if I a sure he can protect himself. Priva operation can be more economical th Government operation. My experien unofficial and official, leaves me room for doubt upon this subject.

"If a man cannot pay his hou rent, he is put on the sidewalk, a if a shipowner cannot make both en meet, he will be driven from the ocea and dumped on the nearest bea Make no mistake about that. the current year we are spending our merchant marine $24,000,000, a in the last year for the Coast Gua alone, the United States spent mo than $24,000,000. For the safety navigation we are spending each ye $8,000,000 upon lighthouses and t lighthouses shine for the ships every flag. In 1924 we spent $8,000,0 for lighthouses, $24,000,000 for Co Guard and $53,000,000 for rivers a harbors, or $85,000,000 in all—and this for advantages accruing to sh whether owned in this country, Germany, Great Britain, Holla Sweden or Norway.

"Every ship in the private Ame can merchant marine must be Americ and our flag must fly in every import port. A quick trip and a quick tu around must be made by Americ officers and American crews, who sil under the American flag in spirit s well as in fact. Where we can't have private operation, we must ha public operation. If not enou American shipowners are now willi to go to sea under the American fl we will all go to sea together. In ot words," added Mr. O'Connor, "whe a private profit is not possible, all of us will cheerfully divide the cot. The American flag is going to sy upon the seas. In this adventure up the oceans 'U. S.' spells 'Us,' and 'U. S. A.,' 'Us Altogether.' "

Where Palm Trees Wave

The Lure of the Southern Seas

By WILLIAM LEE CALNON

Outrigger canoe.

THE baseball game on the Malae of Pago Pago, in American Samoa, had gone its full nine innings last New Year's afternoon, with the Naval Station team triumphant over the Civilians and thereby holding the lead in the Samoan league. It was hot, very hot, on the open, park-like Malae and a group of us sauntered over to the invitingly cool interior of Ben Kneubuhl's general store and steamship agency.

A soda fountain with cooling drinks is one of the features of Ben's store, along with groceries, hardware, agricultural implements, dry goods, clothing, haberdashery, patent medicines, toilet preparations, Yankee notions and what not; as well as steamship tickets to anywhere.

Talk veered from the weather and the baseball game around to a French tramp steamer that had sailed the day before, after a couple of days in Pago Harbor. It had come in from Tahiti with only half a cargo of copra in its hold; though its decks, cluttered with big crates of chickens, pens of goats, sheep, calves, hogs and cows, gave it an overloaded look. The managerie furnished eggs, milk, and fresh meat as needed on the voyage.

"He didn't get much copra here. It's practically all shipped now for this season," said Ben Kneubuhl, referring to the "tramp." "So he has gone on to Apia and will make the Solomons or the Gilberts and maybe a few more on his way back to Marseilles."

"He'll get his load all right when he gets to the Solomons," remarked Captain Joe Steffany. "He'll be lucky if he picks up as much in Apia as he got here. Trouble with Pago and Apia is we're on the main lines. Ships coming along all the time picking everything up. Over in the Solomons and the Gilberts and those islands they have to wait for the tramps to come along and get their copra. If I were he I wouldn't stop at Apia at all. That used to be a great place in the old days, but it's just like this or any other place now."

Captain Joe talked in the tone of voice of the man in the pioneer days out West who decided to move to fresher fields and avoid the crowds when he saw his second traveler in a month. A grizzled veteran who has sailed the Pacific for nearly half a century, the captain knows every island in it and is one of the last of the old-timers whose early days were filled with encounters with cannibals ashore and battles with hurricanes at sea in three-stick schooners. For years he sailed between the Solomons and Western Samoa, carrying laborers to Samoan plantations and back again.

"Tahiti is about the only place that is like the old South Seas that you get to on the main lines," pronounced the captain oracularly.

"How about the Tongas?" inquired a naval officer. "You can get over there from Apia on a regular steamer."

"They're pretty good," said Captain Joe, "but to see the wild life you want to go to the Gilberts, the Marshalls, the Carolines, the Solomons, Santa Cruz, Christmas Island, and places like that."

"But if you depend on tramp steamers you may spend months in some places before you are picked up and can get somewhere else," objected another naval officer.

"Don't depend on 'em," answered Captain Joe. "Have your own boat and go where you please and stay as long as you please.

"Why," he continued, addressing the writer, "you and three or four or five others could buy an auxiliary schooner in San Francisco, fit it out, sail down to Tahiti for a starter and then go anywhere you want. You could eat and sleep on the boat even in harbor if you wanted to and save hotel bills. You could go places where your boat might be the first one that showed up in a year. It wouldn't cost any more than your steamships and hotels will cost on the trip you are making.

"And," he concluded, "when you got tired of cruising or had no more time, you wouldn't have to sail the schooner back to San Francisco. You could sail into Pago Harbor or any other harbor on the steamship lines and sell your boat any time you wanted to. Then you could go back by steamer."

Captain Joe was right and his suggestion an ideal one, provided the intending South Sea traveler has in-

definite time at his disposal. His is the dream trip of everyone who ever fell in love with the South Seas from afar and longed for weeks and months of blissful ease on a sea of indigo; for the flowing sheet and the brisk trade wind; for the sparkling beach and the stately, waving cocoanut palm; for coral isles of extravagant tropic greenery and volcanic isles of gloomy mystery.

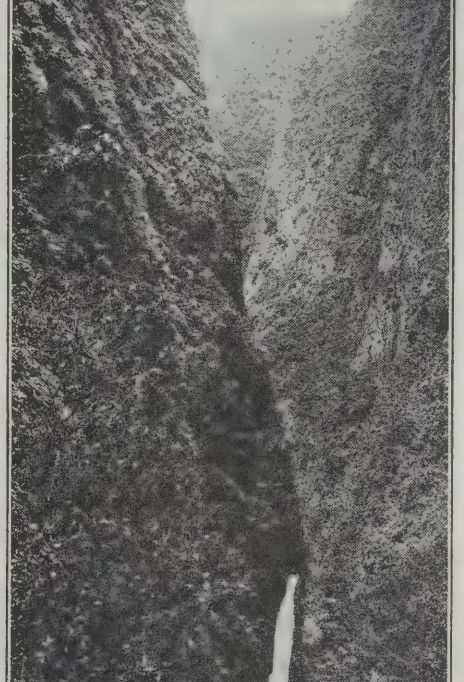
Few can ever realize this dream to its full extent, but many can take advantage of the established routes when they have a few months to spare and can see much of what the Pacific has to offer in scenic glamour, native life and tropical novelties.

One can start from San Francisco, Los Angeles, Seattle or Vancouver and go to Hawaii, "the crossroads of the Pacific," at almost any time that suits the traveler, as there are many lines of steamships running to Honolulu. It is well to see this paradise archipelago first, and the islands of Hawaii, Maui, Molokai and Kauai, in addition to Oahu, on which Honolulu is located. They possess a charm that will never leave the mind of the traveler, no matter where else he goes, and familiarize him with the many things that he will encounter as he goes deeper into the South Seas.

Both American and British passenger ships run south from Honolulu every three or four weeks, and the places they reach include Samoa, both Western and American, the Fijis, the Tongas, Tahiti and the Society group, the Cook Islands, New Zealand and Australia. The traveler can find in visiting these all that he has ever heard or read that attracted him to the South Seas. If, still following the lure of them, he wants more and more, then he can take to the tramp steamers, or to his own boat.

One should never get the idea, though, that there is a sameness to the islands. Each is steeped in its own particular beauty; each has its own especial charm. Sea and sky and mountain and valley and beach and grove and jungle never seem to be the same anywhere. The sight of every new island after days at sea makes one feel like a discoverer, and then, knowing that he is not, gives him a feeling of envy for that redoubtable Captain Cook who found and charted so many of these South Sea groups a century and a half ago.

Life is such a simplified thing in the South Seas that it is easy to forget the world there. Forgotten, or only a dreamlike remembrance, is the roar of the cities, the traffic congestion of metropolitan streets, the surging crowds, the stern battle for existence. In the restful repose of the islands all these things seem alien, far away and



How volcanic ridges look in many South Sea Islands. Waterfall comes out of mountain side.

needless. The native knows nothing of them at all. For him the sun shines and the rain falls and the fruits and vegetables ripen to give him food. The cocoanuts grow and he slices the meat into bits which dry in the sun and makes the copra which the white men send ships for and pay for in money which buys the few things his simple needs require. The white man resident in the islands takes it easy because the tropical heat makes it imperative for him to do so if he wishes to live l and also because the copra m him a good profit when the natives b it in.

The American Samoa native is of highest type of Polynesian, and p ably nowhere can the South Sea Islan be observed to better advant The American Government, through Naval Station at Pago Pago, super the general affairs of the islands, the Samoan runs all his own af that affect his daily life, and has served unchanged all his cust The Naval Station personnel incl only a little more than 200 officers men and the entire white popula at any time is not in excess of These all reside on Tutuila. What Should They Pay?

IN THE midst of all this discussion of international war debts, there is a suggestion which many wait to hear, and which will do credit to the nation that announces it as a principle of settlement. That is, the computation of debts on a basis of the buying power of the dollars that were borrowed. If the dollars which the United States loaned the Allies were worth in purchasing power 60 cents or less, is it quite fair to demand in return dollars that are worth 80 cents or more? Money borrowed was only the symbol of goods to be purchased, for money did not fight the war but goods did; would it not, therefore, be strictly honest to require repayments on a goods basis?

The moral sense of most people will respond to this suggestion, but whether governments would dare, even in the name of honesty, to give public notice that a dollar is not always a dollar, is another thing. The money question is one of the most ticklish matters that lurk just beyond the edge of "pressing problems," and our political officials would probably dread bringing it nearer the center of the stage. Yet there are forces which will press it upon attention if plain problems of moral duty are neglected.

Neighbors helping each other in distress do so with good heart, satisfied if only the principal is returned. The repayment of international debts includes not only the principal, but the difference in the purchasing power of the money as between a period of war and a period of peace, and, in addition to that, the accumulated interest.

Getting Rid of the Trash

THE Attorney-General of the State of Ohio has ordered all Prosecuting Attorneys to stop the publication and sale of salacious and indecent publications, of which he subjoins to his order a list of twenty-one. They are all of the cheap variety, such as boys and girls of moron characteristics would read, none of them even cleverly suggestive.

The Attorney-General recognizes that many news dealers handle this sort of stuff without knowledge of its nature. It is not to be expected that the proprietor of a news stand will set himself up as censor of what writers have written and what publishers have printed and distributed. But the fact remains that, besides the drift of our better magazines to a misrepresentative protraiture of life, there are heaps of rubbish that never come under the eye of the ordinary magazine reader but of which examples may now and then be found among young boys. These publications resemble very much the old-time vaudeville shows in which the pictures were far worse than the performance.

Prosecuting Attorneys, however, have called attention to the official order in their several jurisdictions and the result will probably be the disappearance of much trash from the news stands of Ohio.

If officials of the states in which these objectionable publications originate will now proceed to their duty, which is to stop the nuisance at its source, the benefit will be multiplied.

The Mess Still Persists

THE Shipping Board is still going round in circles. The present Chairman is doing what all his predecessors have done, namely, stirring up of publicity to do what only statesmanly initiative can do. If publicity could have accomplished anything, the effervescent A. D. Lasker would have become a historic figure. He busted the barrel hoops on Shipping Board publicity until the very name in a headline drives readers away. To follow his trail is to repeat his failure. The main desideratum at this moment is to get the mess out of the public eye. The best of the ships have been taken already, at prices and on terms that would give the critic wide scope for fault-finding, if anyone were in the mood for it. But no one is. There would perhaps be only thankfulness and a good deal of public approval for the Chairman and Board that got rid of the ships by any possible method—no one would bother to ask too many questions, and the nation would sigh with relief. But articles in the newspapers will not do it, and attempts to revive the idea of a subsidized merchant marine will not do it.

"Goods Across the Sea"

THE recent speech of Sir Esme Howard, British Ambassador, did not echo through the United States with quite the sounding reverberation that American correspondents of London papers would like the British public to believe. Nevertheless, if Ambassador Houghton can say things in London, it is open to Ambassador Howard to say things in Washing-

ton. And Sir Esme's statements were in the most practical vein of American common sense. He took "hands across the sea" for granted and spoke about "goods across the sea." If Britain cannot sell her goods, she cannot go on paying her debts—which is perfectly logical. Forty-four per cent of the foreign trade of the United States is with the British Empire, a large percentage of trade to have with one general customer. Take the United Kingdom alone—it imported from the United States in 1924 goods to the value of $882,000,000, while it exported to the United States goods to the value of only $404,000,000. So, without suggesting it, which would have been undiplomatic, Sir Esme left us to conclude that tariff regulation which restrained trade was not a good thing for either country. Neither is it.

But the mind that pushes back behind all speeches and present practices wonders how long the nations hope to live by taking in each other's washing, how long it will be before the engineering type of mind in economics makes a workable blue print of the world's affairs so that all can live and perform the most needed and useful service. The economic world thus far has been a tippy canoe, held upright by skillful balancing and frequently throwing its occupants into the water. We can see a condition and haphazardly try to meet it. We cannot see the basic principles and apply them.

Did Man Live Before the Ape?

NOWHERE is dogmatism more precarious than in the field known as Biological Science. Nowhere is revision and refutation more rife. Now and then a nugget of enduring knowledge is obtained. Now and then a guess or a venture lets down the bars into new and unsuspected fields. The glory of Science is in its inquiry, its open-mindedness, its creedal attitude of abject worship of the truth. Not in its dogmatism. The reverses of Science, in its comparative brief history, are far too numerous to admit of dogmatism.

Down in a lonely Arizona gorge, explorers have found drawn on the cliffs the pictures of animals which scientists have told us disappeared from the earth long before the ape appeared, that ape which also laid its remains in the earth before the Coming of Man. The story is told in THE DEARBORN INDEPENDENT of June 6. Upon the walls of the cliffs were found pictures of men in combat with animals which lived, as scientists say, before Man could possibly have lived upon the earth—something like 12,000,000 years before.

If man lived before the ape tribe from which he is supposed to have sprung; if he lived at such a stage of culture that in his comparatively puny form he could do battle with the dinosaur, and later draw the picture of the battle, what becomes of the theory that man is a comparatively late arrival on the planet and had to wait for the ape-form to break the way for his coming?

Upon those walls are also carved the pictures of the ibex or long-horned deer of which no remains have ever been found in the Americas, but which live to this day in Asia. The man who carved the animal saw it. He had perception, intelligence, tools, perseverance, a sense of proportion, judgment and a creative soul.

Yet he lived before the ape from which he is supposed to have sprung.

It will be interesting to see what the scientists do with this new fact. A new fact humbles us all. It is only dogmatism that humiliates us. And truth has a way of confirming, now the Fundamentalist, now the Modernist, and at times confounding both, although the confusion, truth to tell, falls oftenest on the professional modernist.

Dogmatism ill becomes a race that has just begun to finger the first page of the book of life.

There may have been a race of men on earth before this present race.

The higher anthropoid apes may be, as some declare, a degenerated branch of humankind.

Anything is possible except the insufferable spirit of dogmatism.

Mr. Kellogg Confirms the Warning

EVEN the Hearst papers have stopped poking fun at Government officials who warn the country of anti-American activities in our midst. Not so very long ago such officials were accused of setting up a boo-man for the amusement of the public. Now that Secretary of State Kellogg has repeated the warnings given by his predecessors, people are becoming aware of the seriousness of the situation.

It is not Bolshevism from Russia that we have to fear, nor the effect of Soviet funds distributed through malcontents in this country. As Secretary Kellogg quite plainly indicates there is equal danger from those so-called reformers among us to have an incurable itch for tinkering with the Constitution and putting us under a form of Soviet socialism under the guise of humane legislation.

Readers of THE DEARBORN INDEPENDENT do not need a blue print to interpret Secretary Kellogg's remarks. This paper maintains among its other duties that of watchman on the wall, informing the people of active tendencies whose direction and purpose are camouflaged under deceptive labels.

MR. FORD'S PAGE

THE country is now approaching a period when we shall be able to see how much we have learned in the last quarter-century. That is, in an industrial way. It remains to be seen, and will presently be disclosed, whether business is to be trusted with freedom to find and follow a right line of development.

The first surge of business growth in this country brought with it a host of evils. Business itself was not responsible for this, but men who used business as a rake to draw in other people's money regardless of its equivalent in goods or service.

But every abuse brings a sharp corrective and the excesses of shortsighted business men brought down the restraining legislation which marked American politics from Roosevelt to the end of the Wilson Administration. Those were the trust-busting days, the days of regulation, the days when dishonest business fretted against "government interference" and when even honest business sometimes felt that it had ground for complaint.

However, the period of restraint indicated one fact beyond doubt, the American people have no intention of submitting to exploitation without using all legal means to prevent it.

The war came with its depletion of real wealth, and the period of reconstruction called for the utmost wisdom and energy that the world might be enabled to catch up with the long list of its urgent needs. To encourage business, not restrain it, to lift its burdens as much as possible, not increase them, became good public policy. The service of real business to the country began to be appreciated. The old policy of interference and excessive taxation was seen to be a hindrance to business and therefore to the people's prosperity. It became impossible longer to ignore that business and public prosperity were closely allied and interdependent.

People saw this point very readily. The enemy was not business, but exploitation which used business as its instrument. It was not big business that was the enemy, but business whose bigness was artificial and carried beyond the point of efficient service to the people. People saw this, and agreed.

It may be said that with the beginning of the Harding Administration, and to a greater degree through the Coolidge Administration, business was given the freest opportunity ever accorded it in modern times to prove that it would use freedom for the public good. That opportunity exists today. But coexistent with it is a question whether American business is going to justify it. That is an inquiry heard more and more, with an increasing tone of anxiety in it.

Are American business men likely to permit the recurrence of those faults which formerly brought down on business the suppressive operation of the law? It is a question which business men will do well to ask themselves, before people begin asking the Government again.

There has been, of course, in fifteen years much progress in moral engineering as applied to the conduct of industry. Whatever may be the signs of recurrence of old errors, the case cannot become so evil as it was; too many business men have learned the profitableness and security of the better way. The need now is to get these wider business men to leaven all the rest and particularly to keep alive in government circles the newer instead of the older ideals of business procedure.

WHAT if the courts have annulled most of the provisions of the Sherman anti-trust law, would that justify American business in resuming the abuses which brought that law into being? Are we to be only so wise in our industrial service as the laws compel us to be? American business has come to the hour of a certain freedom which it must justify by adopting principles and methods that put public prosperity first. The Administration grants business a chance to find and follow the right path. But it will quickly check any tendency to exploit the people.

Certain students of public affairs are saying that recent Supreme Court decisions practically abolish the provisions of the Sherman anti-trust law. Even if this were so, would it justify American business in going back to the abuses which brought the Sherman law into being? Are we to be only so wise in our service as the law compels us to be? If that is the program to be adopted by business men, it will certainly result in the next being ten times stronger and not quite so easily nullified by court decisions.

The present Administration is justified in granting to American industry the freest condition under which to develop, and there are no indications that it does this out of concern for any class, least of all out of a political respect for money. There is every reason to believe that the Administration knows enough about the two opposing trends of business in this country to exercise a sharp and sudden check upon the wrong tendency the moment it shows itself to believe that the "lid is off."

American business should justify the confidence of the President by pressing all its activities into the New Era method of industry and commerce, which consists in giving the highest quality and service, the highest wages and the highest consideration of public interest, for it is only this that breeds the highest and most soundly founded type of business.

When a Photo Is Not a Pictur

There's Art in the Camera, But It Must Be Developed by the Camera User

IT IS necessary when one starts out to use a camera to have in mind some working concept of what one is trying to accomplish, of what one is going to regard as a successful picture. This is quite as definitely true in the case of picture taking as it is in the making of a screen door or a dress. It is much more difficult in the former instance because art is a universal, boundless thing that is intermingled with everything in life, but whose true nature, and the uses which it serves, has never been ascertained with finality, as it is in the case of screen doors and dresses.

There have been many discussions and opinions of these things. Most artists and thinkers of our time are in agreement on a few working points: that the English Academy idea of a picture as something which exists to tell a story, usually sentimental, was a mistaken one; the idea, also, that the picture of a pink-cheeked girl, golden-haired and smiling is beautiful, but that one of a dirty old woman cutting her finger nails is not—those two opinions upon the function and the proper subject for a picture we have entirely discarded. Instead, we are certain that beauty in art is, as Guy de Maupassant said, a matter of selection and agreement. The picture may, or may not, tell a story, the subject may be a fairy princess or a deformed beggar, these things have nothing to do with art, that is, with the beauty and value of your picture. That which is of vast importance is that every line and mass, light and shadow should be so selected and so arranged that the result becomes an organic whole, from which nothing can be removed and to which nothing can be added without disturbing the perfect balance that has been created.

The difference between a good picture and a bad one is really identical with the difference between the talk of a deranged person and that of an intelligent one. The deranged person prattles on; he may have some idea that he wishes to convey but his words and sentences have no direct relation to one another and, therefore, no clear idea is conveyed. Just so with many pictures, they are incoherent and muddled, they are spots and dots, lights and shadows, but they contradict one another and all lead nowhere. In the conversation of an intelligent person there is unity of the whole and coherence of the parts, so that every word is there for no other purpose than to make clear and interesting the subject about which he is talking; each is selected and placed to further that end. Just so in a good picture, every line, mass, shadow, light, behave as these words and sentences behave. It is safe to say that if the snapshot camera picture, or any other, has these qualities in perfection—coherence and unity, a central theme, no contradiction of the parts, but everything, like the instruments in a symphony orchestra, playing its part to make a centralized whole—then that picture is a success, no matter what the subject may be.

It would seem, therefore, that our working concept of a picture, the ga which we are out to bag, is an rangement of lines, light, ma shadows, which are all brought gether in perfect harmony to conv a central idea.

This article is intended to be a positive, helpful guide to camera users. It seeks to define the difference between a mere mechanical operation and the taking of a picture where the judgment of the photographer is called into use in the matter of composition, light and shade, and the other things that go to make a real work of art.

"JUNE." The picture merits study for its success in overcoming the difficulties of photographing an object in full sunlight.

Assuming that we acc this concept of pictorial phot raphy and begin our journ along the pleasant road t leads toward its realization, shall presently find oursel encountering a series of frien guideposts, erected by w farers who have preceded Among these is Miss Ja Reece, of Dayton, Ohio, zealous photographer who traveled this road with s signal success that her perience may be confidently trus and her pictures used, to strengt with example the precept of the gui post. These pictures have been hig commended for unusual excellence juries of art critics both abroad and America.

The first guidepost to call itself our attention says:

It Is Well to Aim for Simple Pictu A pine branch against a wall is more likely to make a beautiful pict than are forty persons grouped ab in an ornate room.

The second reads

Spare No Time and No Ef in Composing the Scene or Sitter. The painter spares no He works hours and da weeks if necessary, to achi the effect that he desires. same care, patience and crit judgment are essentials to painter with the camera. his case these are to be panded to make his objec scene or sitter pictorially nearly perfect as it is possi In all the other arts of rep duction the scene may be alte upon the working model, artist can add a tree or s tract a house; in photogra the actual scene must be crea in its completeness, for camera takes what is presen the objective world and s the objects in that world arranged for the huge ca of the universe, the photograp needs to select and arra them so that in the minia universe of the photogra print they shall still cohere a unified and expressive pict

For example, it may hap when you go out to photogr a river that there will be tions of it and its environs lend themselves to such tr

Distinctive Results

in Photography Achieved Through Common-sense Principles

"PORTRAIT study," in the oval, upper left, suggests in its simplicity and in the expressive use of its light and dark areas Titian's "Man With the Glove."

ABOVE, right, in the portrait of Lorado Taft, the sculptor, and his "Fountain of Time," the photographer's skill is clearly evidenced by the ability with which the frail figure of the sculptor has been made to dominate the majestic figures he has created. This picture is now placed in Chicago.

THE beautiful combination of lights and shadows on the San Juan Capistrano, California, presented at the left, were won by the photographer after a patient wait of five hours.

position, and many that do not, however perfect they may be in the whole great arrangement of the world. Accepting the counsel of the second guidepost one walks slowly up and down by the side of the river scanning every aspect closely. One finds, and perhaps after a long search, a section where the stream winds along the shore in an undulating line. There are a few tall trees where the water will enter the picture, some lower ones where it will wind out; high trees on one side will inclose the river as between two sets of pillars, or prison walls; the low ones will enable the river with ease and gentleness to vanish into suggested distance. There is a line of trees on the far side of the water which repeats the shape of the river and so gives the rhythm that comes from repetition; there is low brush in the foreground through which the water may be photographed; there may remain a few limbs of trees to be broken here and there. One can then place the camera and wait for the moments when wind and sun and shadow give to the water life and vibration, and the picture can be photographed.

It may be well to interpolate here that it is both wise and considerate to take no one along when one goes out to hunt pictures with a camera. The hunter after quail and deer leaves his family and friends behind him when he goes out on his quest; if he chooses to have any companions they are co-hunters. The hunter for pictures may well learn of him. If he takes friends with him their impatience may draw him from the path of his intent, or his persistent singleness of object may deprive them of amusement and meals.

The second guidepost loses none of its force when the picture is to consist of the portrait of a human being. The average human face and body are not easily arranged into a clear and orderly and beautiful composition. The photographer needs to use all his ingenuity to accomplish it quite as completely as when his subject is a group of buildings, a bed of daffodils or a river. He needs to take time, to be observant, to make experiments patiently with his sitter, the camera, the light. The sitter, for instance, may be one who would make a pleasing picture when seen in profile if it were not for the fact that his nose is annoyingly short, or it may happen that his cheek bones are too high or his neck too long; the possible successful picture is, however, not lost, for experiment will reveal that by tilting the top of the head toward the camera and the nose away from it the nose achieves a satisfactory length, and you have the picture just as you want it; the high cheek bones will look normally high when the chin is tilted toward the camera, the accentuatedly long neck becomes of proper length when the camera is held high.

Your subject may be a sturdy little boy who is a large and important factor in his family. The essence of depicting him rightly is to depict him in the perspective in which his associates see him. But as you look at him through the lens of your camera you see just a little boy, nice, with strength and independence but unmistakenly diminutive in relation to the surroundings, which is just the thing he is not to his habitual human surroundings. In this case you cannot solve your problem by any change or adjustment of your sitter, but you will find that you can solve it by adjusting your camera, you can lower it bodily, put it on his level, the thing his associates unconsciously do with themselves and then take the picture before you. He appears just as you wish him to, just as he essentially is, a big, handsome little boy. Which sounds like a paradox, but is a pleasant matter of fact.

"IN THE PARK." A composition after the manner of Japanese prints that is worth emulating. Three-fourths of the objects in the picture are placed in one-third of its space.

The third guidepost relates to the exposure of the plate or film to the light:

Use Certainty and Not Guesswork in Time Exposure. Miss Reece recommends the following proceeding for ascertaining the length of time: close one eye, squint the other, and, while counting slowly and regularly, metronome fashion, keep that eye on the finder or ground glass. A moment will come when the picture seen there will be luminous. Lenses are like eyes, the number that you counted until the picture became bright in the finder is the number to count while exposing the film or plate to the light.

Guidepost number four:

If You Would Grow in the Art of Photography Develop Your Negatives Yourself. No etcher would have another than himself "bite" his plates, similarly no one who loves his pictures will let another develop them. Learn thoroughly how to do it, as you do to drive a motor car, so that the process of it becomes almost automatic, then set yourself to refining that sure, basic knowledge until you become a master in manipulating your plates in the developing process. Slow developers are more readily manipulated.

The next guidepost that we see reads:

Give Your Negatives the Advantage of Beautiful Printing. Here also there is a chance for art and a last chance to let your critical judgment come into play. It may happen that a negative is beautiful in all respects, idea, composition, the state of its development but it falls short of giving you complete satisfaction because it is somewhat too definite, too sharp. Here printing can rescue you from frustration, reverse the negative, print from the "wrong" side, and the whole is softened, and your finished print is precisely as you desired it to be.

There are still guideposts visible all down the road that stretches ahead of us but it may be sensible for us to let them go unscrutinized for the present and to sit down with Miss Reece's pictures to see what they may reveal.

It would be useful if we could go to the old mission of San Juan Capistrano with the photographs of it and stand where Miss Reece stood when she took it. We should certainly say, upon first view, "It is not so beautiful as she has made it." As we look longer, however, we see that it really is, that it possesses the possibilities which she has actualized and which it reveals only under favorable circumstances. She waited five hours, observing intently all the while, until the light and building together presented the picture we have here; she waited until there was the one strong, accented spot of high light, and the soft high lights permeating the spaces between the arches, until the ceiling and the rear wall were heavy with darkness, and there was the deep shadow in the lower right-hand corner from which the eye travels out into the light and on down to the baptismal font. She waited (Concluded on page 29)

Bureaus Grow to Bedroom Suites

How the Right of Self-Government Is Being Swamped in Centralization

By MARGARET C. ROBINSON

JAMES Russell Lowell was once asked by Guizot, the French historian, how long he thought the American Republic was likely to endure. "*So long as the ideals of its founders* continue to be dominant," was Lowell's memorable reply.

Have we forgotten what those ideals were? They were a strong belief in Christian principles, in the right of private ownership of property, devotion to law and order, and, above all, *belief in the principle of self-government.* The cornerstone of our national life is this belief in self-government. The founders of our Republic, who were thorough students of the science of government, knew all about kings and emperors, bureaucrats and tyrants, under whose rule the people had few rights, and these acquired by long and bitter struggle. Having the opportunity to start anew in America, these men were determined to secure for themselves and their descendents the right to self-government.

When the People Cease to Think

Bureaucracy accustoms people to let somebody else govern them, which is fatal to democracy. Germany's chaos today is the result of her people being so completely untrained in self-government. Their government so long dictated what they should do and think that now that the bureaucratic, paternalistic rule is removed, they are like a ship without a rudder. Next to Russia, Germany was the most completely bureaucratic government in Europe. The people had no practice in the management of their new affairs. Today the bureaus in Washington are as numerous as they were in Berlin before the war. This means that our power to govern ourselves is being removed, usurped by the Federal Government by means of bureaus. George Washington foresaw this danger clearly and warned his countrymen, saying: "Let there be no changes by usurpation, for this, though it may in one instance be the instrument of good, is the ordinary weapon by which free governments are destroyed."

In 1900 there were three commissions or bureaus at Washington, costing $820,000 a year. They have multiplied during 25 years by 1,000 per cent and their cost is $200,000,000 a year more than the entire cost of our government 25 years ago. Is it any wonder our taxes are heavy, for it is we who pay the bills.

Judge Thompson, Chief Justice of the Supreme Court of Illinois, says: "Billions of dollars are expended every year in this country in an attempt by the government to do for the people *what they could infinitely better do for themselves.* Government job-holders are stepping on each other's heels and new jobs are being created daily. Tremendous as is the cost in millions and millions of treasure spent to maintain this hundred-headed bureaucratic monster, it does not compare with the cost in priceless fundamental principles destroyed. Every time the state or the nation is permitted to do that which should be done by the local county or city government, the people are surrendering a fundamental and sacred right."

We are, in fact, witnessing in the United States today a sharp conflict between two schemes of government. On the one hand is the American ideal of local self-government, which insists upon every reasonable opportunity for individual liberty and upon the preservation of the family as a social unit. On the other hand is the pre-war German and the present Russian plan of a strongly centralized government, controlling and directing the individual's activities, his domestic relations, and the solution of purely local issues according to a nation-wide standard, established and enforced by a central bureau.

President Coolidge has spoken again and again of the menace of growing centralization. He says it is making our Federal Government top-heavy. He says: "I am fearful that this broadening of the field of government activities is detrimental both to the Federal and State governments . . . Efficiency of State governments is impaired as they relinquish and turn over to the Federal Government responsibilities which are rightfully theirs."

Again he says: "If we are to maintain the nation and its Government institutions with a fair semblance of the principles on which they were founded, two policies must always be supported. First, the principles of local self-government in harmony with the needs of each state. This means that in general *the states should not surrender, but retain their own sovereignty, and keep control of their own Government.*"

Children's Bureau Grows Like a Beanstalk

Thomas R. Marshall, late Vice-President of the United States, said that he was long enough in Washington to see more than one small bureau grow into a full-sized bedroom suite!

No better example of this growth could be given than the Children's Bureau. When it was formed in 1912, it asked for an appropriation of only $12,500 and Congress was assured that it would never need more than $25,000 a year. In eight years it was asking for 26 times that amount, not counting the $1,240,000 which it receives under the Maternity Act.

Not content with this, the Children's Bureau is now trying to get the Maternity Act extended to take in Porto Rico, Alaska, and the Philippines, as well as the United States. Hawaii has also been taken in. This means more jobs, and more taxes, and so it goes in every bureau. If the Child Labor Amendment is ever ratified, the Children's Bureau will be given the task of executing such laws as Congress may see fit to pass "to limit, regulate and prohibit" the labor of American citizens under 18. The size of the bureau necessary for this task can only be conjectured. It would certainly be enormous.

Some Glaring Examples of Overlapping

Since the bureaus stand together and work together for their growing demands, they constitute a very menacing political machine which in time no President or Congress will dare oppose.

A recent issue of *The American Medical Association Bulletin* printed an article headed, "*Always One More Bureau.*" It said:

"That consuming passion for erecting one more bureau—and always one more bureau—in the government at Washington was never more grotesquely illustrated than in a certain passage of one of the recent reports of the new $50,000 commission of inquiry into agriculture.

"This commission discovers that there are overlappings of jurisdiction and duplications of work among the existing government bureaus. What, then, does it recommend? Why, of course, it recommends the establishment of a new bureau, a new 'interdepartmental agency,' the duty of which shall be 'to study this matter and to promote interdepartmental coördination.'

"Thus the commission contrives on its own account actually to suggest a new overlapping and duplication. It suggests a bureau for coördination when already, as a matter of fact, there are now two such bureaus simultaneously operating.

"One of them is the bureau of efficiency. Among the very first duties of this bureau is that of investigating 'duplications of work.' In the last fiscal year it made ninety-one inquiries into such duplications. Then there is the bureau (Concluded on page 27)

Romantic Rascals—No. 4

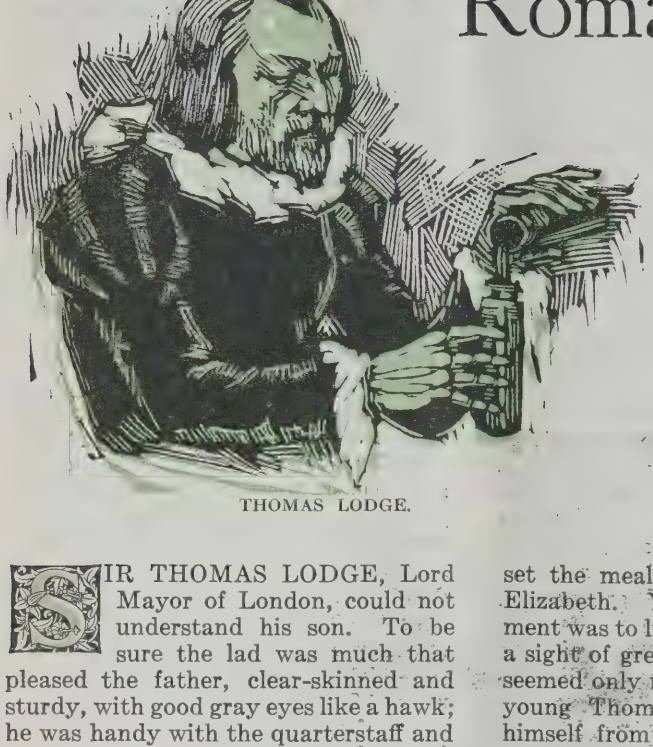
Thomas Lodge

By CHARLES J. FINGER

Author of "Highwaymen," "In Lawless Lands," "Bushrangers," "Tales From Silver Lands," etc.

WOOD BLOCK CUTS BY PAUL HONORÉ

(Copyright, 1925, by Charles J. Finger)



THOMAS LODGE.

SIR THOMAS LODGE, Lord Mayor of London, could not understand his son. To be sure the lad was much that pleased the father, clear-skinned and sturdy, with good gray eyes like a hawk; he was handy with the quarterstaff and a good wrestler, could ride well, could swim, could handle weapons deftly. But there was that strange, unaccountable taste for books. There was the still stranger taste for the companionship of bookmen. And as the lad was what the father called a "good tale-teller," who could be very frank and merry when the mood suited, it displeased the master of the house that young Thomas should choose rather the company of those who talked about books than older men who had done things. For instance, when Mr. Burder visited the Lodge home, there was Thomas off in a vast hurry to walk the Surrey hills with his friend Edmund Spenser, fellow scholar at the Merchant Taylors' School. And when the lad returned, laughing and bright-eyed, instead of listening to Mr. Burder's tale of how he, when mayor of Dover in the year 1563, had captured no less than six hundred French sh ps and sixty-one Spanish, there were the two with nothing better to do than to tell how they had been amazed and pleased at the sight of a stone bridge here, or a rose-twined cottage there, or, somewhere else, a flock of sheep grazing on some hillside where the shadows flew. Certainly, thought the father, such talk is far from valiant when right-minded lads should be in a glow about Drake, spoiling Spaniards, or about Hawkins, getting gold off the African coast by capturing Negroes and selling them as slaves.

So, to fill his son with proper pride in his country, Sir Thomas managed matters in such fashion that young Thomas might see royal glories at first hand, visiting the place where authority dwelt. It was no easy matter to gain entrance to the palace, but because he had been Lord Mayor in the year 1563, there were modified relaxations, so at last father and son stood in a darkened room, and, through a panel hole, looked down into the chamber where was being set the meal for Her Majesty Queen Elizabeth. Yet after all, the experiment was to little purpose, for what was a sight of great solemnity for the man, seemed only ridiculous to the lad. For young Thomas could hardly restrain himself from laughing aloud when he saw a tall man with a gold-tipped rod advancing into the chamber, followed by another dressed in scarlet who carried a tablecloth, which, after kneeling three times, they spread. Then the rod bearer, having knelt three times more, left the room, reëntering presently with the saltcellar bearer and the bread-plate bearer, so there were more kneelings and genuflections, a careful placing of this plate and that exactly thus and so, then more kneelings before they left the room. As for the twenty-four Yeomen of the Guard, each one carrying a dish, and the Lady Taster who gave each one of them something to eat from a dish by way of testing for poison, and as for the twelve trumpeters and the two drummers who made the walls ring again with their noise, at all of them and their doings young Lodge grinned, and, at the end, when the plate bearers carried a dish to the queen who dined in a private chamber alone, he said that to his thinking, it was all idle folly and pompous nonsense. But the father was moved with deep emotion at sight of all that ritual and, being at home again, talked for awhile about Drake "singeing the King of Spain's beard," then touched on the inferiority of all foreigners and ended by saying that his son should be proud that he could call himself an Englishman. When the lad, with respect in his manner, said that he did not see how all the burning and slaying of enemies made for a country's greatness, the ex-Lord Mayor wagged his forefinger at his son and told him that he talked like a jackanapes and a faint-spirited foreigner.

"Sharp words to end a pleasant beginning, sir," said the son, reddening and knitting his brows. "But to change your mind, I shall join the ship bound on a buccaneering cruise to America, which is now fitting out in the Thames."

But on that cruise Thomas did go, for the father, who was sorry for thoughtless words and had no idea t his son was the wearer of a white feath sought out young Spenser, who sp in high praise of his friend's ver Then, mistily believing that lawyer author meant pretty much the sa thing, he walked into the city, some of his friends, and the upshot all was that Thomas was entered Lincoln's Inn to be a lawyer.

That was in the early part of year 1578, but before the summer gone Thomas flung his law books as having no mind for the reading of ot than the prose of Sir Thomas Moor the poetry of William Dunbar. instead of sitting in law courts, he sp much of his time at inns and ot lounging places, listening to out elbow writers, or himself reciting lads on the death of Douglas and Pe and the like. So the young man bur his bridges and destroyed his bo idling in the streets where prent called their wares; or hobnobbing v such fellows as Marlowe and Peele Greene and Kyd who wrote dran or watching the people at bull baiti or seeing the frays of sword and buc men, almost everyday occurrences; eating and drinking with penni pamphleteers such as Harvey, Nash, and Dekker, and Breton. It a happy-go-lucky life that he led, so times with money in pocket after rowing from old Henslowe the pa broker and giving a manuscript security, at other times running u score at the Golden Pheasant wh the rough-and-tumble John Hall always willing to supply a plate of and a pint of wine to those who follo the dangerous trade of author.

One day, into that life burst handsome and fiery young Earl Cumberland, M.A., of Trinity Coll Cambridge, and he was one who touc all hearts because he was honest fearless, soft of voice, genial to a fa loyal to his friends, but very conte tuous of the whole crew of writing n Most mercilessly he began hurling bal thunderbolts at the head of Tho who was his own age within a year. denounced in extraordinary variety volume, and with an assumption his victim yearned for nothing than mere indolence. Was Thom he wanted to know, going to spend

fe among a pack of ne'er-do-wells? Would he always allow pleasure to absorb his energies? Did he expect to arve a career among winebibbers and awnbrokers and actors? Did he aim t vacuity rather than action and fullness of life? Could he, a young man full f capacity, fail to see that a true poet hould also be a gallant knight with a word at his side, as was Sir Philip idney? He went on, with great enthuiasm, and at the end flung on the table glove which he took from his plumed at, a glove which had been given him y the queen. "That," he declared, is what I fight for. More, I am resolved to do what I an to the end that England shall come o rule the world and hat Spain shall acnowledgeour Queen!" Then out flashed his word and up went very wine cup, and very man was on is feet, every one noved with a high nd shining purpose s he shouted, "To he Queen!" As for he heart of Thomas odge, it was at once lled with the fierce oy of anticipated attle.

Nor were there ostponements. For freebooting expedition under Captains Clarke and Cavendish as fitting out to perate in Spanish aters and, when it ailed, Thomas Lodge as of the party. rom the year 1584, ntil the year 1589, n the neighborhood f the Canaries and he Cape Verde Islands there were erce activities. It as war to the death ith many a sound hip sent to the bottom of the sea. It as a time of hard nocks and hostiles, of strange ferocies and fine courtesies, of legalized iracy and attacks upon noncombatnts in the name of patriotism. For while Thomas Lodge was dazzled and ooded by exciting sensations, but the assionate desire to express himself in ords did not sleep for long. There ere days when he forgot the world of attling ships, and of roaring cannon, nd of chain-shot, to dwell in other heres. So, on that expedition his encil was busy and he wrote "Glaucus nd Scilla," then "Catharos, Diogenes," nd, most noteworthy, a tale called Rosalynde," not at all about bloody ten and deeds of derring do as might ave been expected, not about the thundering days of the Great Armada, but, instead, about rightful and usurping dukes, girl friends wandering in a forest and passing as lady and page, a wandering band of robbers and all that kind of thing, with, at the end, a happy clearing up of misunderstandings. When Lodge reached London he had it published, and men here and there found it interesting, especially a young play writer who had come from Stratford, one named William Shakespeare who had the trick of picking up odd stories and redressing and adorning them. As he saw Lodge's story, with a touch of humor here and there, with an under-

On this voyage his pencil was busy.

plot added, with a few extra characters invented, a lively play might result. So William Shakespeare set to work, used the buccaneer's plot as a scaffold, created a Jacques, a Touchstone and an Audrey; turned Lodge's wandering girl friends into brother and sister; made the two dukes as brothers, and, behold, there was common clay changed into fine gold and the play was presented under the title of "As You Like It."

But for Thomas Lodge, life in the raw weighed heavier far than literature; to tempt fortune pleased him more than to court fame. For a year he stayed in England, sometimes in his old haunts in the city among his cronies of the stage, but for most of the time he was a kind of epicure of life. In a favorite garden at the end of a stone-walled lane there was a seat under a mass of greenery, from which place he could see the ship-laden River Thames, and there he read the "Faerie Queene" of his friend Spenser. Sometimes he walked tireless miles with the poet by moonlight or in the starless dusk, through the fragrant country, talking always of adventure overseas. For a new idea was in his mind, and he was filled with a great desire to see that land discovered by Columbus almost a hundred years before. So when he heard that Sir Thomas Cavendish was fitting out a galleon, the *Desire*, for a semi-piratical cruise to Brazil, he was all eagerness to be of the crew. And when, on August 6, of the year 1591, the *Desire* dropped out of the harbor with cannon booming and trumpets blowing and flags aflutter, Thomas Lodge was aboard.

Then came the grim business at Santa when houses went up in flame, and, with rolling drums and threatening arms, the piratical crew of Captain Cavendish marched through the town leaving smolder and ruin in their wake. The Jesuit college with its priceless library might have become ashes like many other buildings, had not Thomas Lodge discovered the treasure. Having found it, there was no more piracy for awhile for Thomas Lodge. The hard-handed buccaneers went about as they chose, and the galleon swung at anchor in the bay while the warrior lords took their ease in the college, some living fatly, caring for nothing, but the pirate-writer rummaging among rare books of parchment, old treasures; the books of Dante, and Pletho, and Bessarion, and Gaza, and some of the MSS. that had once belonged to Niccolo Niccoli. Nor did the strange fellows leave their peaceful quarters on the breezy hilltop until the end of January, 1592. Then, because one of the crew spread about among his shipmates a tale that he had heard of wonders to be seen in Patagonia, of giants and cannibals, and of great birds "more than the biggnesse of a man," the ad-

Should the Bishops of England Consent to Open Her Sealed Mystery Box?

By PAUL TYNER

AN EIGHTEENTH-century wit once said that the great end and aim of English jurisprudence was to "get twelve good men in a box." However this may be, there is no doubt that the whole end and aim of a most ingenious and elaborate last will and testament left by a very clever and seemingly pious old Englishwoman, who died here about 110 years ago, was to get twenty-four good bishops to open a box. Paradoxically enough, the wording of this will has in practical effect caused the said bishops to keep the box closed.

The old woman was named Joanna Southcott, famous in her day as a "Prophetess," and even more famous in our day by reason of the rumpus that is being raised by her followers in their public and private insistence, not only that the bishops should open the box, but furthermore that they shall open it in the presence of twenty-four witnesses chosen from among these followers, along with an attorney and any "sealed person" who desired to be present. The opening of the box must further be preceded by two whole days of discussion between the bishops and the Southcotters and the reading by all the bishops of "The Book of the Trial of the Claims of Joanna Southcott," prepared by that good lady back in 1804. The reference to "sealed" persons has a special significance as will appear later.

Early in March, 1918, Haig and his army were retreating before the terrific advance of the Germans. When near Calais, whence it was expected the British would be driven into or across the Channel, Haig stoutly proclaimed that he would even there, "with his back against the wall," make a last stand against the foe. Then twenty-four bishops of the Church of England got together and yielded to the fervid protestations of the Southcotters that surely the "time of grave national danger" had arrived in which Joanna had predicted the box should be sent for by the bishops, and that its opening "would see an end of England's troubles."

The bishops, that is to say, yielded so far as to ask that the box might be taken to the Jerusalem Chamber at Westminster for that purpose. But because the bishops would not promise to comply with all the other conditions mentioned, the present custodian refused to part with it.

The bishops hoped that this refusal had spiked the guns of the insistent ones and no more would be heard of Joanna and her box. They reckoned without their host, for within the last year or so the Southcotters have redoubled their energies and have been, in season and out of season, keeping the powerful engine of publicity going, in their endeavor, by force of public opinion, to compel the bishops not only to open the box, but to open it in precisely the manner and under just the conditions that the "prophetess" had prescribed. They bought advertising space liberally in the newspapers and maneuvered to get still more space in the guise of "news" —often succeeding in "making" news, as in the case of the presentation of a monster petition about a month ago to the Archbishop of Canterbury and the Primate's refusal to accede to it—noting especially that "just as the petition was presented at Lambeth Palace a terrific thunderstorm broke over its roof and floods of rain poured down on the Midlands doing much damage to crops."

> The strange story of an English Prophetess whose will and whose writings have stirred up a world-wide rumpus one hundred years after her death —claims that she foretold the great war, airplanes, tanks, gas-bombs and all the rest—why her followers demand that twenty-four Bishops of the English Church shall open the box — present-day fulfillment of her prophecy of an era of healing free for all — remarkable new departure of the Southcotters in vigorous propaganda of absolute democracy as the coming form of national and world government—leader of movement claims to be reincarnation of "Shiloh," feminine avatar to whom Joanna Southcott expected to give birth. Bedford, Bunyan's picturesque home town, as a shrine of the cult. Archbishops of Canterbury and of York said to approve convocation of twenty-four Bishops of English Church to open the Mysterious Box in accordance with Joanna's will.

For several months early in the present year great posters stared out on the passer-by from the deadwalls and in the underground railway stations, announcing:

THE FATE OF MOSCO

and Even Worse Upheaval, Horro and Bloodshed

WILL BE THE FATE OF LON

Unless the Bishops Relent and Open Jo Southcott's Box within 60 Days

LET THE PEOPLE OF ENGL TAKE WARNING AND BEWARE THE WRATH OF A JUST GOD

Similar warnings were sent to King, the Prime Minister, the Chief Justice and the Archbisho Canterbury and York.

Well, the sixty days came and —and nothing happened. That say, no calamity beyond the ordi normal number of accidents and and the intensification of unem ment with its drain for doles o public purse. A great silence fell the Southcotters and—with all more exciting events of the acce to power of a Socialist governme Britain, the overturning of Poi in France, international tennis ma and echoes of troubles in India, land and Egypt—Joanna and he seemed likely to fade into oblivio far as public interest was concern

Then came a new turn in the of campaign of the Southcotters. lowing what theatrical press a might irreverently term the "pub stunt" of the recent big petition t Archbishop of Canterbury an sarcastic rejection of it, and an a simultaneous appeal of the Archb of York to the British Medical Co to appoint a committee to look the whole question of spiritual he London was flooded with circular pamphlets, and several public me were held under the auspices of Panacea Society," announcing another of Joanna Southcott's p ecies was finding fulfillment. was declared to be nothing less tha dawning of the new era of a "Visi of Healing" for all. The lead Joanna's followers, it was annou had most unexpectedly receiv revelation as to the method of healing. It was entirely different all other methods of spiritual heal vogue and vastly superior, inas as it was direct from God and une required no faith or even intelli on the part of the sick, and is given without money or price. I a "healing by water." That investigation by the writer prov water in which certain little s white tablets had been dissolve the solution swallowed or a

ernally, according to the nature of disease; this daily for several nths or more, and "strictly ac-ding to instructions."

The Southcotters have accordingly rganized under the name of "The nacea Society" and are issuing a ll-got-up little monthly, called *The nacea*, devoted to carrying the news this "visitation of healing" to all world, and incidentally to the prop-anda of Joanna's prophecies and erpretations of the Bible—keeping stantly to the fore the rousing of people to persistent and tinuous demands that the hops *shall* open the box!

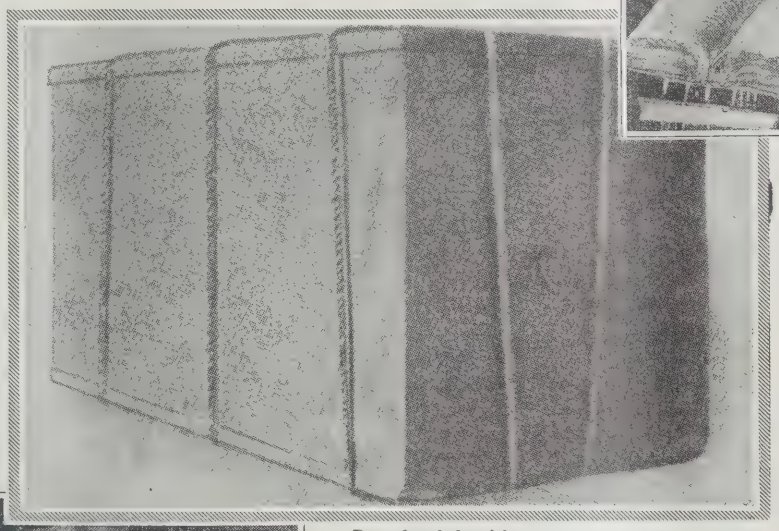
So a number of people America, where Joanna said to have more than 000 followers, as well as England where the num-is more modestly stated 12,000, are emerging from tate of blissful indifference bishops and boxes and are ing two questions:

"Who was this Joanna uthcott, anyway?"

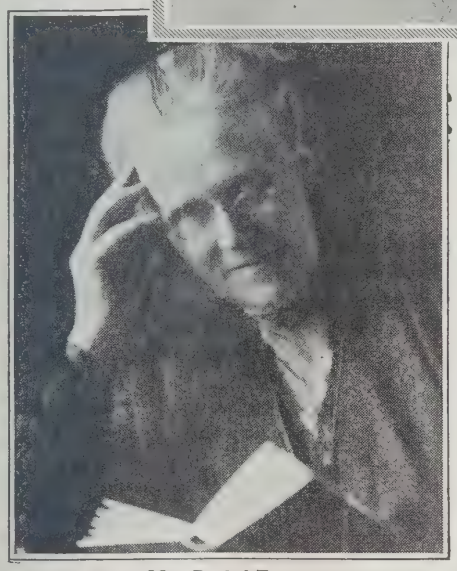
"What is in the old box make such a time about?"

Readers of The DEAR-RN INDEPENDENT have got o the habit looking to pages for onicles of glected truth. this case far it from me pronounce h finality or gmatism just at is the th in this e as between versions set th with ap-rently equal nesty of con-tion as to nna. The rest plan, bably, will to set both ies before THE ARBORN IN-PENDENT'S readers and let them ke up their minds for themselves. ay two sides, not that the bishops re allowed the Southcotters to put m on the defensive. In fact, as far I can find, there is no one really posed to the opening of the box and is not suggested by even the most iid and conservative of church ple that this box of Joanna's may ve to be another "Pandora's Box" ich, in the light of classic example, ght be better kept closed. Partisan-ip is all on the side of the followers of l Prophetess. But there is what may called a nonpartisan view of the ole matter placed on record by torical writers who had no interest the thing one way or the other.

As the result of further strong epistolary appeals sent out to ninety bishops and suffragan bishops, it is declared that the Archbishops of Canterbury and of York and five bishops have now signified their willingness to attend the opening of the mysterious box left by the seeress locked and sealed on her death about one hundred years ago. They seem to have succumbed to a gentler diplomacy and, conditionally at least, have consented to witness the opening of the box in the presence of a jury consisting of twenty-four of their own number and twenty-four "sealed" members of the Panacea Society. It is believed that the mystery will be revealed and the long agony of waiting and wondering ended within the next three months. The box is said to be in Bristol in the safekeeping of Mrs. Rachel Fox, a descendant of the clergyman to whom it was originally intrusted more than 100 years ago. Certain members of the society favor requiring the bishops to to go to the box in Bristol while others believe it would be more courteous to bring the box to the bishops here in London, or even to the seat of the Primate in Canterbury. There is also a possibility of the Bedford members demanding that the box shall be opened in a special room at headquarters in Albany Road, Bedford, which has long been prepared for it.



Box of sealed writings.



Mrs. Rachel Fox.

Joanna Southcott.

Joanna Southcott was born in Devon in 1750, the daughter of a farmer in the parish of Ottery St. Mary. As was the custom with farmer's daughters in those days, she went out to service in the Manor House and later in the rectory of the parish, keeping her eyes and ears open while attending to her domestic duties and, being serious minded, devoting much time to reading her Bible and other good books, so that she indulged in none of the games and pastimes that attracted more light-minded maidens, and never married. She was 42 years old when, according to her own record, she began to listen to "an inner voice" and became endowed with the gift of prophecy.

In short order, she drew about her a number of people of the neighborhood who were vastly impressed by her strange sayings. Many of these prophecies were in verse. Not having been taught to read and write, she dictated these prophecies to a young curate and some of them were printed and widely distributed. They came to the attention of William Blake, the famous mystic and engraver, and he induced her to come to London. Soon afterward she parted company with Blake, set up on her own account and began "sealing" the 144,000 of the "Elect" at the modest fee of 12 shillings to a guinea apiece, according to the means of the convert. In the course of a few years her adherents numbered nearly 100,000 persons of all classes. During the last year of her life, 1814, she gave out that, in accordance with her own prophecies and her interpretations of the Book of Revelation, she was about to give birth to a child immaculately conceived by the Holy Ghost and who would prove to be the Savior of the World—Christ in his Second Coming. But the expected birth did not occur. Instead, ten days after the designated day, Joanna passed into a trance and died. The medical man in attendance gave the cause of death in his certificate as "brain disease."

Joanna left two boxes, one, that which is just now the subject of so much controversy; the other a smaller box which, in accordance with her directions, was kept carefully locked and sealed until 1824, ten years after her death. This box was then found to contain a complete outfit of baby clothes beautifully made and embroidered. As to the big box still to be opened, we are told that it contains a number of manuscripts, the nature of which was kept secret by Joanna. She stated, however, that the bishops who would open the box "in time of national danger" would find in it writings which would impart a basis of union for all the creeds of Christendom and those of the Orient likewise, including the Jews. It is further declared that this union would not involve impossible fusion of the churches, but would enable them to form a strongly coöperative league against evil of every sort: a League of Justice that would insure the peace of the world, preventing wars and securing the happiness and welfare of all humanity. This surely is a consummation devoutly to be wished for.

It seems a pity that so valuable a contribution to the solution of the world's pressing problems should be kept locked up in an old box hidden away mysteriously and kept from the knowledge of suffering humanity by what the Southcotters declare to be the stubbornness of the Archbishop of Canterbury and by what that eminent prelate lays to the stubbornness of the Southcotters, who are its custodians, in insisting on the prerequisite of forms and ceremonies which he pronounces so "fantastic and profane" that the hierarchy of the Church of England cannot lower its dignity to take part in them.

It is to be noted that Joanna wielded the pen of a ready writer, to judge by the fact that she wrote about one hundred books, many of which are to be found in the great national library of the British Museum. Sixty-five of these books, besides any original manuscripts (of which there are a vast number) "in the possession of Believers," are to be exposed for investigation on the first three days of the assembly which it is demanded the bishops shall convoke for the opening of the box.

A Chest of Oak Sealed With Seven Seals

As to the box itself, we are told by the Southcotters that it is really a box within a box. The inner box is described as a large chest of oak, iron-bound like a seaman's chest of the olden day and locked, roped and sealed "with seven seals." The outer box is a huge deal contraption about eight feet long by five feet wide and four feet deep in dimensions. It is bound with a stout hempen ship's rope and fastened with a padlock, both ropes and padlock being further fastened by large seals bearing the impress of a seal ring worn by the Prophetess.

The box was given into the custody of Joanna's friend and follower, the Rev. Thomas Foley, and has been handed down to his heirs from generation to generation. It is now in the custody of the latest of these descendants living in a town in West England, who guards it sacredly. Indeed, the Southcotters declare this box to be "the Ark of the Testament, Containing the Will of the Lord God and Expressing His intentions concerning this Country." Exact information as to the name of the custodian and his address is refused to "outsiders," and these particulars appear to be known only to members of an inner circle even among the initiated. By a strange irony of fate, the present Bishop of London, who is said to be a collateral descendant of the Rev. Thomas Foley and who, in 1814, on the death of Joanna became the custodian of the box, has distinguished himself among all the English bishops as most scornful of the pretensions of her followers, declaring her alleged prophecies to be stuff and nonsense, and the idea of twenty-four bishops bothering their heads about whether it is ever opened as simply preposterous.

Prophecies Which Made a Prophetess

It must be said that Joanna's followers, on their side, confidently base their claims to attention on what they consider the irrefragable evidence that Joanna was indeed a Prophetess sent by God in the fulfillment of no less than 200 of her prophecies. Many of these referred to important events taking place in the century following her death and including the breaking out of the great war, the use of airplanes in that war and England's bombardment from the air, as well as the use of tanks in battle and of poison gas and incendiary bombs. Stress is laid on predictions that "England is to possess Jerusalem when she shall join in war against the Turks," and shall govern Egypt. From the nonpartisan standpoint, the cryptical form in which these prophecies are cast is viewed as an indication that they were mere wild guesses, possible to anyone and heralded after the event. Anyone with common sense, it is suggested, might predict that there would be wars and earthquakes in the course of one hundred years and that new and strange war devices might be brought forth. Tennyson, in "Locksley Hall," looked into the future and saw aerial navies battling in the skies and dropping bloody rain. Joanna did not predict railways, telegraphs, telephones or wireless.

Naturally enough, the omnipresent skeptic and cynic will ask, "What is the catch?" Perhaps I had my own suspicions. But I am compelled to confess that a very full investigation has convinced me of the entire sincerity of the Southcotters. They are not getting any money from the general public to speak of—nothing like the money they have been spend publicity for the demand th bishops shall open the box. F more, that avid desire for th light for the exploitation o particular leader's personality, vious in most movements of th is here conspicuous by its a

The Coming Form of Rule

The only ality wh "glorified" of the P etess wh been dead for 110 years!

Nor have I been able to any purpose to build up an ins which shall wax wealthy and p through the propaganda of views or doctrines. Joanna Sou followers, today as during h time, are faithful and steadfas bers of the Church of England as such members of the chur they demand the attention of stituted ecclesiastical authoritie do not flock apart and hold services of their own, and they ar royalist than the King" in mar For instance, the leading articl first number of *The Panacea* is "Absolute Monarchy: the Comi of Rule." The writer of it insi all other forms of world rule are and that the only form of gov which can ever be really successf absolute rule of a King and Q Father and Mother, to whom th as children in the family, wil implicit obedience.

It is consolingly added th temporary chaos must and wi vene, there will be a way out a will quickly evolve. "Then w the absolute parental rule of t and Queen, acting as Fath Mother of the nations . . . af land has learned her lesson, solute Monarchy, under uni never-before experienced Div mediate rule, will set all things and they will never be crooke

There is an absence of an tion of desire to exalt the "belov as that famous Austrian psyc Dr. Stekele, terms it; an obsess personal importance and its c as public notice in any of the ties of "exhibitionism" of the t indeed, is all the other way.

The Abbé Lamennais, w French to this day regard as on greatest writers, in 1750, the which Joanna was born, wrote

"I see the East, and it is I watch its ancient temples fa dust. It raises its eyes as if another God . . . I see in th Woman. With steady hand s a light furrow, and wherever h share passes I see generations rising up to bless her in their so I see the devil fleeing away, an with all His angels coming t

But, as Maeterlinck says part of a prophet is, next to a commentator, one of the mos and thankless to sustain."

Quaint Old Ipswich of the Dunes

Strait-Laced in the Past and Retaining Its Mellow Savor in the Present

By MAY B. WHITING
ILLUSTRATIONS BY STANLEY W. WOODWARD

STRAIT-LACED, ecclesiastical Ipswich, lighting the fires of learning in the wilderness, then watching the years p by, filled with stories many as the nds of the dunes! No other village old Massachusetts retains more of s old-time savor. Houses with beetling cond story are so common that they arcely attract the eye, Church Green even today the center community life, and, t on Ipswich Bar, arry Main still winds s cable of sand and rieks as the waves rush rough it.

Ipswich was founded 1633 by John Winrop, son of the Gover-r, to offset the French ttlement at Cape Sable. y order of the court ung Winthrop started t in March with twelve en to find the Indian llage of Agawam, where, was rumored, the land is uncommonly fertile d fodder abounded. ney found that the Inans had already cleared e slopes of the hills for anting corn and the arshes yielded great uantities of hay. For enty pounds sterling e Sagamore Musconoimet gave up his rights the whole district, setting his mark the deed which is now preserved in sex Institute in Salem. The newmers gave the name of Ipswich to e settlement in memory of the town England which had shown great ndness to the men who shipped from ere.

The prestige of its founding atacted the élite of the colony. Here me Governor Dudley and his daughr Anne, the poetess of the New World, th her husband, Simon Bradstreet, o was to hold the highest honors at the colony could bestow. Here ed the "first great Democrate," hn Wise, whose activities in the bellion against Andros gave Ipswich e right to bear on her seal the gend, "Birthplace of American dependence, 1687."

A few months after its founding overnor Winthrop journeyed on foot the new settlement to see how his n was faring and tarried over the bbath. Later some of the most urned divines of New England dwelt Ipswich. The first minister was athaniel Ward, author of "The mple Cobbler of Agawam," and of The Body of Liberties," a code of laws adopted in 1641 and recognized as the foundation of the States' sovereignty.

But in the midst of all this wisdom and sober thinking the daughters of Eve did not forget their birthright, and their frivolity sorely tried the good minister's soul. He thus berates the ladies of his parish: "When I hear a nugiferous gentledame inquire what dress the Queen is in this week, what the nudious tertian of the Court, I look at her as the very gizzard of a trifle." A dreadful squelcher, indeed, but the chances are that feminine curiosity about the Queen's dress was just as rampant as before.

By 1646 the town had a good meeting house but its crudeness must have contrasted strangely with the high tone of the preaching within. It was surrounded by a stockade and patrolled during service. On its outer walls hung gaping wolves' heads, for the town offered a reward to whoever should kill one of these marauders and, to receive the bounty, the claimant was ordered to bring the head to the church and nail it thereon.

In the shadow of the sacred edifice were the implements of punishment, the stocks, the pillory, and the cage, and the town annals show that they were not allowed to fall to pieces through disuse. On one Sunday in May, 1702, Captain John Stevens had the audacity to drive through the village in a "calash," with dashing Jane Sandiman by his side, and for this "prophanation of ye Sabbath" he was duly brought to court. At the foot of the Green was the gaol where Goody Cole and other witches were detained awaiting their trial at Salem. Here the aged Giles Corey made his will, and here, in Revolutionary days, the British soldiers were guarded.

Standing on the Green at Ipswich, it is easy for one to bring back in fancy those happenings. It is not a sleek greensward, but a ragged hill where a granite ledge thrusts out its ribs on every side. When Whitefield preached to the crowd assembled there, the devil perched on the ridgepole of the church, and, infuriated at the holy words, leaped down and left the imprint of his hoof on a rock beside the very door where all who pass may see it today. To the Green, at sunrise, the hogs were driven, thence to the common beyond the town. An hour later the cows were gathered at the horn of Goodman Symnes and driven to the village pasture land.

Ipswich was the scene of a unique industrial venture. (Concluded on page 29)

The Earthworm as Man's Best Frien

A Skilled Tiller of the Soil and Indefatigable Promoter of Fertility

By WILLIAM ATHERTON DU PUY

HERE is an odd creature which plays an important part in the welfare of the world by a lowly and unusual means. It renders a great service to mankind, to its fellow members of the animal kingdom, to the plants that grow from the soil, all by the strange device of eating dirt.

This animal with the peculiar appetite, the only animal in the world with this food habit, is none other than the modest earthworm with which one baits his hook when he goes fishing. So little understood is the earthworm that most people consider that it renders its greatest service when it wriggles on a hook as a temptation to brook trout. Great would be the surprise of these people should they find out that, aside from this purpose, the earthworm has earned itself a place in the world alongside the cow, the horse, the little brown hen, in the group of most useful animals.

This dirt eater serves its chief purpose by making the soils of the earth more fertile than they otherwise would be. It is Nature's own cultivator of the soil. Through the ages it has stirred up the soil of all the continents of the world more than have the harrows of man. It has worked without ceasing through the centuries, mellowing the earth's surface and making it more productive.

Making the Earth Fruitful

It has always added to the world's harvests and harvests have always been the world's primary interest.

In the average one-acre garden there are 50,000 earthworms always working. They represent 400 pounds of brawn busy at the business of soil mixing. They are working in your garden but they are also working in your wood lot, in your meadow, your cornfield. You may not plan to cultivate the wood lot but they will none the less keep it stirred up against the possibility that you may change your mind. They will mix the soil of the everglades and of the lowlands where the Yukon flows down to the sea. They are at it in teeming India and on the Pampas where graze the herds of Argentina. All over the world the earthworms are working in the top soil and their labors make it better for growing the crops of today or tomorrow or that are to feed generations as far beyond us as we are from Adam.

The first aid which the earthworm lends to the fitness of the soil comes from the tunnels it runs through the ground. It creates a network of them in the surface soil. Along comes dry weather and the surface soil is too dry and hard for its operations. It digs deeper, perforates the second foot down. Then, as winter comes on, if this is a northern earthworm, it realizes that it must go still farther down, must get beyond the point where there is any chance of freezing. For this and other reasons earthworms may go down four feet, six feet, even eight feet.

These tunnels let the water in. It softens hard, dry places. The earth deep down becomes a storage reservoir for moisture that may save plant life when dry spells come. Plant roots follow the wormholes where they might not otherwise be able to penetrate. Thus do they reach new supplies of plant food.

An Expert in Tunnel Construction

The manner in which this earthworm, delicate, soft-bodied creature that it is, makes its tunnels through the ground, is very peculiar. If you will examine its soft, jointed body, made up, maybe, of 200 segments, you will find that it comes to a point at the head. This worm, placed in a pan of soft dirt, will sink its sharp nose into some crack in the dirt. It wedges between two particles of dirt. It then proceeds to press its inner body into the portion of itself that has got into the crack. This crowds the dirt to the sides. It edges in a bit more, swells itself out, enlarges the tunnel.

Having thus crowded the dirt out and made a passageway the size of its body, it secretes moisture from its sides and with it a bit of lime. This hardens and holds the tunnel in shape.

This type of construction, however, will not fit all requirements. Possibly the worm could not wedge in. There might be a heavy, black, putty-like mass of mud ahead of it. It is necessary to use some other method.

Has a Crop and Gizzard Like a Chicken

Very well, says the earthworm, I will eat myself a tunnel. Whereupon it goes at the wall with its mouth. It fills itself with black mud. Having thus eaten heavily of dirt it decides, by instinct, to make the most of the meal. Since it lives on vegetable and animal matter possibly there are some of these materials in this dirt that it has eaten. If so, it will extract them while the dirt cargo is aboard and make use of them.

The earthworm has a crop and gizzard as has a chicken. The crop lets the swallowed dirt into the gizzard a little at a time. This gizzard is filled with sharp, grinding bits of stone such as the chicken uses but, of course, much smaller. In this gizzard all the dirt that has been eaten is ground up, worked over. Everything in it, such as ing leaves, is set aside and used a The great mass of it, however, g through the earthworm's syste is discarded.

Before discarding this worke dirt, however, the earthworm ta to the surface. Anybody who wi the trouble to look can see piles o about, in the garden, along the p the edge of the pavement. Billi earthworms every night brin worked-over dirt to the surface, what as do the ants, and leave it by their holes, where it can be recognized.

The earthworm, however, w dirt that has no food in it for t purpose of digging a tunnel. To this an experimenter filled a ja fine sand containing no humus, packed it down. He then put an worm on its surface. That eart tried to make a hole by the cr method but the sand was pack tight. It then set about eating i down. It took it two days on a sand but in the end it succeeded

Bringing Up the Earth From Below

This brin dirt from b the second service of the worm. It br up from two inches down, four inches down, from six a foot, two feet, four feet piles it at the surface. It does w plow does but it goes deeper, steadier. It is at it everywhere time. One earthworm in one da not accomplish much but all o working through the centuries this surface dirt slowly workin and forth.

It would be hard to find a par meadow dirt that had not at so passed through the gizzard of an worm. In doing so it has been up, its quality as plant food ha improved. It is better soil.

A farmer in England once layer of quicklime over a meadow lay there unplowed through the years. Six years later he put on of cinders. Ten years after down the quicklime he was diggi holes across the meadow for a ne He observed that, one inch bel surface all across the meadow, through a layer of cinders, an inches down he passed through of quicklime.

The farmer remembered the lime and cinders he had scatter the meadow 10 years earlier. strange, he thought, that these rials should thus have sunk i ground. A careful examination s however, that they had not su the ground but that dirt ha

ght up from below by earthworms piled on top of them. Four years this field was again examined and quicklime and cinders were found inch deeper than before.

Careful observation, over long peri- of stones lying on the surface of the nd show that they gradually dis- ear. It is an interesting fact that recently plowed or otherwise ght to the surface is likely to show y small stones. Land long undis- ed offers no pebbles for the boy's gshot. They have been covered up he earthworms. Even stone walls, ent ruins, gradually work deeper into the ground.

he Earthworm Is a Night Prowler

In soils where earthworms are plentiful they are believed to bring to the ace an inch of dirt each three or four rs. It is fresh dirt thus given to the for the first time. It is finely ground in form to be used by plants. It is e dirt likely to drift into the low es. It has done much through the turies to smooth out the rough es on the earth's surface.

Then the earthworm proceeds to te its third contribution to the rovement of the soil of the world. It ld be known that this useful animal night prowler. Like the stealthy nts and the flitting bat it is abroad fly when conventional people are fortably tucked in their beds. By the earthworm is likely to sleep just erground with its nose very near the ning to its tunnel. If you suddenly pe away the earth it has brought up are very likely to see it making a k retreat.

When the light of day is gone, how- , it comes forth. It does this for ral reasons. Then it may meet r earthworms and nighttime is its ic time while there in its tunnel by it is all alone. Then, also, it may a bit of green food to vary its monot- us diet of dirt. Further it is safe night, for the birds that so delight ating earthworms are on their roosts. Yet the earthworm is a modest sort rager when it goes leaf hunting. It t be because it is not very well pped for careering in the great er world. In the first place it can- see at all. It has not so much as the blance of an eye. It does not need n down below and they would not much use to it when it comes to the ace, for this is nearly always done by night.

It Can Hear But Has No Ears

Neither can the earthworm hear. It has no ears. Its body is sensitive to t. It can tell the difference between t and darkness. Its body also is itive to vibration. It can tell when orkman is busy nearby with his ple or when the mole, its arch enemy, unneling in a nearby bit of earth. se senses are entirely aside, how- , from those of sight or hearing.

The earthworm has no nose and so cannot smell. It has no lungs. It absorbs air through its skin by a process that may be called breathing but which is not.

So there is left to it but two of the five senses with which it must do the best it can toward getting on. These are the sense of feeling and the sense of taste. With nothing else to guide it this modest, lowly animal must earn its living, must render its hugely important service in the world.

When the earthworm comes to the mouth of its tunnel in the nighttime it is very likely to be looking for garden truck for its supper. In its hunt for it, as a poor blind creature, it must be careful not to lose its way. It takes a great deal of pains to keep in touch with its home in the ground. Men, when they go into unknown caves in the underground world, where the worm is at home, often tie twine to some object at the mouth of the cave and unwind balls of it as an insurance against getting lost, that they may follow it back to the surface. Acting upon the same principle, the earthworm ties itself back to that underground world which is its natural abiding place. It does not carry a ball of twine but its own body may be so lengthened as to serve very nearly the same purpose. This blind and deaf and noseless creature leaves its own tail snugly anchored in its tunnel. Thus made secure it reaches out with its body in all directions from the hole in search of leaves.

Turning Vegetable Matter Into Fertilizer

With its toothless mouth it may seize small leaves or blades of grass and drag them into its lair. When a leaf is too big to be handled in this way or when the worm cannot get hold of it with its mouth it resorts to a different method of attack. It draws the pointed part of its body back inside its bigger rings as the tip of the finger of a glove may sometimes be pulled back. Thus it changes the forward end of its body from a pointed object to a very blunt one. This blunt-ended body, in fact, becomes a suction cup. It presses it against the leaf and withdraws the head farther within the body which causes the suction pump to take hold. With a leaf thus grasped it pulls its body back into the hole.

Vegetable matter that is thus taken underground by the earthworm serves two purposes. In the first place, the worm may cover a leaf with acids secreted from its own body, thus softening it and making it possible to eat it even with a toothless mouth. The great majority of this vegetation, however, is used for the purpose of blocking up the earthworm tunnels and thus making them secure from intrusion.

Whatever the object of the earthworm in bringing this vegetable matter underground, it serves a valuable purpose by being converted into fertilizer. Farmers plow under green crops, scatter straw upon the land, take great pains in one way or another to introduce vegetable humus into the soil because they know that this vegetable matter will cause that soil to yield better crops. This modest little assistant gardener for all the world has been working steadily at getting humus underground for millions of years.

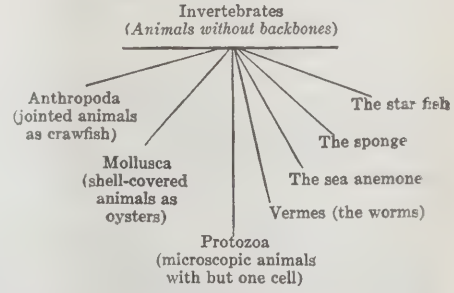
It Is an Animal Without a Backbone

The benefit that the earthworm has done by running tunnels through the surface soil, by constantly bringing up subsoil, by constantly taking vegetable matter below the surface, is one that is beyond the power of man to estimate. One might conceive that this constant service of the earthworm through the centuries has made the earth twice as productive as it otherwise would be. One might conceive that it has made the soil 10 per cent more productive. He might even estimate that the earthworm has made the soil produce a modest 1 per cent more than it would have produced otherwise. There is no way to determine the fact, but even this 1 per cent increase in the productiveness of all the soils of all the world would have been a stupendous service to man, to animal life, to plant life, would have been a service such as few creatures have ever rendered.

It may seem odd that this earthworm should be referred to as an animal. We must, however, go back to the fact that all living things which are not plants are members of the animal kingdom and are, therefore, animals.

The first great division of the animal kingdom is into two parts, subkingdoms: the vertebrates, which have backbones, and the invertebrates, which have no backbones.

The invertebrates are divided into eight branches or phyla, some of which, as the starfish, are not very important, and some of which, as the jointed animals, including the insects, are very important. They divide themselves as follows:



All the animals that we have so far treated have had backbones, have been vertebrates. The more highly developed animals mostly belong to the backboned groups. It would be a great mistake, however, to overlook the great groups of animals that are without backbones, groups of much more variety and stronger in numbers than are those with backbones.

The earthworm, of course, belongs to the *Vermes* branch of the invertebrates. This is a small branch with not nearly so many

Stronghold of the Personal Pre

Editors of Kansas Papers Who Are Not Mere Cogs in Machi

By FRANK M. CHASE

"KANSAS education," declared Chancellor E. H. Lindley, in the course of the education-political tangle in which he was the central figure, "should be as free as the Kansas press." Not only was the Chancellor's point well taken, but the comparison was particularly apt. For probably the press of no other state in the nation is more outspoken, more truly reflective of the real views of the editor, than is that of Kansas.

Why is this so? Why is the Kansas press so widely quoted, and why does it stand out in the nation's journalism?

One cannot go very far in studying the press of this state without discovering three well-defined characteristics:

1. The Kansas press is a free press. 2. The Kansas press is a personal press. 3. The Kansas press is a representative press.

The personal cast of the Kansas press appears quite naturally. There are no very large papers in the state. Their control, editorial as well as financial, is generally in the hands of one man, and his views are his paper's views.

"We frequently read or hear it said that the days of personal journalism have passed and that the personality of the editor has become lost in the machinery of the paper of which he is only a cog," said O. W. Little, secretary of the Kansas Press Association, in a recent statement. "This may be true to some extent of the great metropolitan papers but it is not true of the profession in Kansas. Never before were so many strong, virile writers to be found on the country dailies and weeklies in Kansas as today. I could name fifty or more of them whose names are familiar from one end of the state to the other."

A glance at a few of the names in Kansas journalism reveals something of its temper. E. W. Howe and William Allen White are the most famous of the men who exemplify its personal character. Some of the others—less widely known, yet frequently heard of beyond the borders of the state—are Henry J. Allen, Charles F. Scott, Victor Murdock, George W. Marble, Charles M. Harger, and W. Y. Morgan.

Closely related to the personal press, as it exists in Kansas, is the matter of representativeness, and in this lies a lesson of great significance in American life. As Nelson Antrim Crawford of the Kansas State Agricultural College has pointed out, the country press, with its nearness to the people, plays an important part in our democracy.

"The great city dailies," he says, "consolidating rapidly and under control of a few very r will come to represent less and real viewpoint of the mass of th Mr. Munsey, Mr. Hearst, Mr Mr. Scripps—none of these speak for Kansas. The n speaks for this state through must be of this state, and it is that states like Kansas be rep As Thomas Jefferson pointed ago, popular government wo in rural regions, and more a this is going to place upon the the Middle West responsibilit success of popular governme

eveloped a ruggedness and a fighting pirit that was carried into the columns f their papers. They worked and ought hard, honestly, and unafraid, aving a heritage that is now admired om coast to coast.

It is significant, yet quite in keeping ith the spirit of those men, that what as apparently the earliest code of hics adopted by any association of urnalists was accepted by Kansas litors. This was the Kansas Code of thics, written by Willis E. Miller, nd adopted by the Kansas Editorial ssociation in 1910.

Of recent years, and in accord with ne modern scientific trend, another ctor has arisen to shape the press f the state. This is the influence of ne journalism departments of the niversity of Kansas and of the Kansas tate Agricultural College. While is influence is comparatively new, ne departments scarcely getting under ay until 1911, they have already put neir mark on Kansas journalism and ve even greater promise for the ture.

At the University of Kansas in-ruction in journalism began as early 1903, but, as the professor of English ho conducted the first course has put , "without a journal, without a ress, and without a cent." By 1911 ne work reached the status of a de-artment, a paper having been acquired the meantime. At present the de-artment has an instructional force of x and a well-equipped newspaper and b printing plant, while for several ears an average of more than three undred students have taken courses journalism each year. Of these oung people about one-third have een definitely preparing for news-aper work, and there are records to ow that a goodly number of the raduates have cast their fortunes with ne country papers of Kansas.

"It is inevitable that the students in ur department should appreciate the ttractiveness of country and small city journalism," says L. N. Flint, chairman of the department, "because every member of our faculty is experienced in that field and believes in it. Practically all of the twenty-two courses are as much for men and women going into country journalism as for those entering other fields, while four courses dealing with the business management of the small paper are exclusively for the country editor.

"Students in the department are at all times in close touch with Kansas journalism. They frequently appear on the program of meetings of Kansas editors. They listen to addresses by visiting Kansas editors. They conduct surveys on newspaper conditions and problems, through correspondence with Kansas editors and through study of the newspapers of the state. We tell our students that study of the opportunities in journalism will show that the advantage lies strongly with the country reporter."

Flint himself served as the editor and part owner of a Kansas paper before beginning his work as a teacher of journalism at the university in 1906. He has also spent a number of summers in some of the largest newspaper offices of the country, as well as being the author of two books and a contributor to many magazines and periodicals.

The associate professor of journalism, Helen O. Mahin, likewise has worked on both small and large dailies. Miss Mahin was the first woman in the United States to receive a Ph.D. in journalism, though is perhaps better known as the compiler of "The Editor and His People," a collection of the editorials of William Allen White. She is also the author of "The Development and Significance of the Newspaper Headline."

In a statement of the destination of the graduates majoring in his department, Professor Flint names fourteen men who have already become established as editors and publishers of Kansas newspapers. A much larger number, of course, are working, some in highly responsible positions, in the news and advertising departments of Kansas papers. Nine are listed as teachers in the colleges and high schools of the state, while some, finding attractive business openings in lines other than journalism, have embraced other opportunities. About fifty graduates of the department are working on metropolitan papers in various parts of the country. That more of the graduates have not become newspaper owners and editors is attributed largely to financial inability.

Far from seeking a large enrollment, the journalism department of the University of Kansas considers it one of its functions to weed out persons who have a misdirected ambition to enter a vocation for which they are not qualified. No freshmen at all are admitted to courses in journalism, and only those others whose records indicate an aptitude for the work.

Throughout the student's training in this department—not merely in one course labeled ethics, or some such name—effort is made to instill in him the highest ideals of the profession.

"By all odds," says Professor Flint, "the most important service of departments of journalism is the effective teaching of principles and ethics. Unless this is allowed to dominate the course, the work of a department sinks toward the level of training performing seals."

To this end his department has developed the case method of teaching newspaper ethics, being perhaps the first to employ it in journalistic instruction. Problems such as arise in newspaper offices are assigned to each student, and an answer required. Most of the students have opportunity to work in one of the executive positions on the university daily, and their experiences with questions involving newspaper policy are utilized in fixing ideals which might otherwise last no

Students getting practical printing experience, Kansas State Agricultural College, where printing has been taught since 1874.

longer than the classroom hour. Besides the situations presented by the university paper, editors and managing editors send in a great variety of "clinical material."

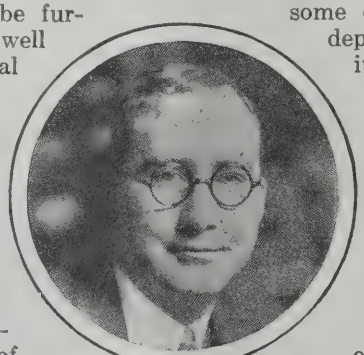
It is worth noting, too, that this department regards the influence of the press as greater today than ever before—not in the same way as in the days of Greeley, Dana and Watterson—but nevertheless greater, and that it regrets the tendency of small papers to abandon the editorial page. Though the country editor may not have the authority, due to special knowledge, of the large papers; though he may be a very busy man, and his readers may care more for local news, is the attitude, still he should not utterly neglect his opportunity to do something as interpreter and guide.

Owing to the character of the institution, the department of industrial journalism at the Kansas State Agricultural College gives a somewhat more specialized training than does the university. While the course prepares men and women for every phase of journalistic endeavor, the aim is to have them obtain specialized knowledge in some industrial field, commonly agriculture or home economics.

"The farms and the households of the United States are the basis of our contemporary life," explains Professor Crawford, head of this department, "and a person who knows what interests them has a place on any publication, whether city or country. We also regard it as part of our service to increase the voice of the farmer in our national life.

"The farmer is, as a rule, neither an experienced speaker nor an experienced writer. His isolation has made him relatively inarticulate. He needs the coöperation of the newspapers, and especially of the country press. The interests, not only of Kansas but of the nation, are dominantly agricultural, and until the press speaks more clearly for the farmer it cannot be called truly representative.

"As civilization has grown more complex and everyone's interests have broadened, facts must be furnished in the country as well as the city by professional agencies—the newspapers. The country newspaper has a peculiar opportunity for public service through acting as the professional fact-finding agency for the farmers of its community. Not only the profits of farming but the success of popular government itself is in danger if the farmer continues inarticulate."



Nelson Antrim Crawford, professor of Industrial Journalism.

Instruction in journalism at the agricultural college had its beginning back in 1874, when the president of the institution, himself a printer, organized a class in practical printing. Working in writing, copyreading, and proofreading gradually developed from this. In 1910 several courses under the name of journalism were introduced, the four-year curriculum being offered for the first time the following year. Printing, however, still remains a feature of the department, and one course of a year's duration—a scholarly history of typography—is required of all students majoring in journalism.

Professor L. N. Flint, chairman, Department of Journalism, University of Kansas.

At the present time about five hundred students are enrolled in the department, of whom one hundred eighty have chosen journalism as their major. The fact that all agricultural students in the college, in recognition of the need of farming for more trained spokesmen, are required to take at least one course in journalism accounts for a considerable part of the large total enrollment.

Entrance to the news room of the *University Daily Kansan*, which is published by the journalism students of the U. of K.

Agricultural papers naturally draw some of the graduates of the department. A summary of its graduates lists seven names in this field. A like number are editing country papers in Kansas, and five more are with the large dailies and press associations in the Kansas City territory. A number are in advertising and publicity work. Six are engaged in teaching journalism in colleges of agriculture, while many more are in similar work in general colleges and high schools.

Every member of the teaching staff, which numbers six, has had practical journalistic experience; this, in fact, is a prerequisite to their p tions. They also write a great dea their present capacities, their tributions appearing in a wide rang literary and scientific jour Professor Crawford hin is the author of two bo "The Ethics of Jour ism," and a volum poems, as well a contributor to nu ous literary per icals. He is president of the K sas Authors' Club of the American A ciation of the Teac of Journalism.

"One of our chief in teaching journalis Professor Crawford said, "is merely to train men and wo to write, but to teach them hov think; to get the facts in each prob to analyze it, and form a conclu based on actual conditions instead accordance with some time-hon custom or platitude. We try to dev in short, a realistic point of view."

The same might be said with e truth of the journalistic training at University of Kansas. Both de ments are forward-looking, and sirous of training men and women will maintain the Kansas traditi coping with reality.

Perhaps nothing attests more str ly to this forward-looking policy the attention given the high sc papers of the state. Both departm hold contests for these, and mee for the staff members each year. these papers, no less than on the dailies, the editors of the future trying their wings; and in guiding boys and girls aright, as well as own students, the department journalism are building for a long tinuance of a distinctive pres Kansas.

Bureaus Grow to Bedroom Suites

(*Concluded from page 15*)

the budget. One of the supreme con-uous efforts of this bureau is the coör-nation of the work of all the other bu-us and departments in Washington. he bureau of the budget has a chief ordinator. It has a deputy chief ordinator. It has a half-dozen assist-t chief coördinators. It has a little ck of 'coördinating boards.' Finally, t through the country it has 'area ordinators.'

"Now comes the commission on quiry into agriculture with the commendation that there be es-blished a third bureau for coördina-n!

"The next logical move would be, course, to erect a fourth and supreme ordination bureau which would co-dinate the three coördination bureaus eady in existence.

"Congress might offer a reward to y Federal commission which can nclude its inquiry and adjourn with-t trying to plaster another barnacle reau on the grievously impeded hull the ship of state."

Elihu Root, recognized throughout te world as one of our greatest lawyers and statesmen, says of Bureaucracy: "It is a complete reversal of the fundamental principle upon which our system is based." He says: "It will destroy the whole system and ultimately break up the Union. *The most distressing thing about it is that no one seems to care.*"

This was written several years ago. Today there is the beginning of an awakening of the people to this danger. Americans have not wholly lost the instinct for self-government—it has merely been dormant. The nation-wide defeat of the Twentieth Amendment was undoubtedly a protest on the part of all classes against the further encroachments of the Federal Government on the rights guaranteed to them by the Constitution.

Romantic Rascals

(*Concluded from page 17*)

venturous soul of Thomas Lodge was fired, and the commander was persuaded.

Southward the *Desire* was headed, and they sailed until the mighty headland of Cape Virgins was sighted, where, because of great breakers plunging landward, and wild icy winds threatening danger, they entered the Straits of Magellan. Without map or chart they made their way through the first narrows and into the bay beyond, then there was a most tortuous and dangerous course around the peninsula and into the opening that leads to the great inland and shallow sea known as Otway Water, not clearly defined on maps to this day. There they ran aground and struck for many a long day, eking out their ship's fare with fish and mussels and eggs. But with Thomas Lodge, neither brain nor pen was ever idle, so, while shipmates worried and strove and despaired, Lodge wrote his strange novel called "A Margarite of America." "In those straits christened by Magellan," he writes, "in which place to the southward were many wondrous isles, many strange fishes, many monstrous Patagons . . . the time I wrote in was when I had rather will to get my dinner than to win my fame. . . When I rather observed men's hands lest they should strike me, than curious reason of men to condemn me. . . I wrote under hope rather that the fish should eat me than fame should know me." From which we infer more than Thomas Lodge tells, and wish that the author had chosen to write of the things that befell there rather than of fanciful creatures of his imagination. But then your adventurer is not often given to tell of himself. We know this much. From that voyage, only sixteen men returned, and of that number no more than five were in good health when the *Desire*, all rotten-timbered and leaky, reached Ireland on June 11, 1593. Lodge was one of the lucky five, sound as a bell in mind and in body, robust and energetic, and carrying his almost forty years like a boy.

But his wild oats had been sown, and there was within him a resolute determination to avoid complications and intricacies in the future. Believing that it was nobler to war against disease than to break other men's bones, he set himself to study medicine and took his degree at Avignon. For ten years he practiced as physician in London, in odd times making a study of and writing a book on the strange disease known as the plague, after which he retired to live in touch with the beauty of the earth. Still, idleness and Thomas Lodge were always strangers, so there came from his pen a couple of plays and very complete translations of Seneca and Josephus. So the gallant old figure marched, very full of energy, very determined, very happy in his friends and his cronies, and, having played his part on the stage of life, made his exit in the year 1625, a victim to the plague he had hoped to defeat, and which carried off in that year, in London alone, thirty-five thousand and four hundred odd men, women and children.

On the Road of the Charcoal

(*Concluded from page 2*)

rings. She says to her brother, "Do you think it will fall off before I get to Madrid?" He spits and reassures her. She gets into the omnibus with another girl and joins the heavy black figures with the dull earthy faces. All the way to Madrid, over the busy plains and over the swerving passes, past the teams of the charcoal carriers, past the solitary stick gatherers and their thin donkeys, the earthy people will bump and will be shaken, all the way to Madrid.

The coughing and sputtering of the engine is heard again. The omnibus spurts away and has to pull up suddenly for a flock of sheep. One of the charcoal carriers who has been standing at the door of the *posada* gets talking to a man who is tethering his pony to a post nearby. He is the brother of Asuncion.

"She's gone," he says.

"What time will she arrive?" asks the carrier by way of sympathetic interest.

"Don't know. This evening."

"Heavens," says the carrier, thinking of the lanky miles there are to Madrid. "Heavens!" he says, "What's the use of a railway to such a well-communicated place as this! Yes! Yes!" he says.

"Caramba!" says Dona Luisa, "Something's burning. My skirt!" She is awake again and is rushing to a bowl of water holding the smoldering corner of her skirt. "Seven o'clock. That new maid, Maria, Carmen, Asuncion, whatever her name is, should arrive in half an hour." Dona Luisa shivers and stirs up the charcoal in the *brasero*.

The Roosevelt of Religion

(*Concluded from page 3*)

succinct. No "hot-air"; all solid sense, with a lilt of laughter and a gleam of genuine humor to brighten it all up; a great, dynamic, friendly, unruffled man, patient as Job with the heckler; able to see the gleam of truth or honest inquiry in a rambling question; never scolding; he flashed like lightning.

In those twelve minutes just exactly eleven questions were fired at him. He answered every question, intelligently and satisfactorily.

"What is the difference in the regenerative and the altruistic spirit in man?" was the first question.

Dr. Cadman answered: "I want to judge a regenerated man by Paul and Augustine, and not by any old fellow. I believe that a regenerated man will have a new altruism born in his soul. Jesus' teaching was that of regeneration. Altruism alone will not do to save a man's soul."

A Jew asked the question: "Do you believe the gruesome blood-death of Jesus is a wholesome enough basis to found a religion on?"

Dr. Cadman: "The most important thing about the Lord's death was that he fulfilled the supreme law of sacrifice. Looked at in that light his death is beautiful and not gruesome."

A wild-eyed person, wanted to make a speech and not to ask a question, the gist of which was: "Why should we not have a scientific religion?" Dr. Cadman let him ramble on, saying now and then, "Go to it, brother! Have a good time while the going is good!" Then he shot his answer:

"The most scientific nation on earth brought the greatest chaos to humanity. No, we cannot have a scientific religion alone; great moral principles must control science!"

"Shall we have a Prohibition Bible?"

Dr. Cadman: "No, leave the blessed book as it is."

"Did Darwin or the Greeks start Evolution?"

Dr. Cadman: "I demand that Mr. Bryan's pet be let alone in this sacred hour. But, seriously, the Greeks did discover the principle of the Theory of Evolution, but they found no proofs for it. Darwin and Wallace found the proofs."

"Do you believe in the Virgin Birth?"

Dr. Cadman: "I believe in miracle, if that is what you mean. The miracle of the radio today is as great a miracle as the Virgin Birth. A greater wonder than the Virgin Birth was that a man like Jesus was born at all."

"Who is the archenemy of mankind?"

Dr. Cadman: "Man is his own archenemy."

"Who is God?"

Dr. Cadman: "Personalize God in terms of Jesus Christ or you'll get little help on that problem. Know Him and you will know God."

"Was Huxley honest?"

Dr. Cadman: "A more honest man never lived. He was an honest, brave, magnanimous agnostic."

I do not pretend that these questions and answers were verbatim. I took them down in that whirlwind of questions and answers.

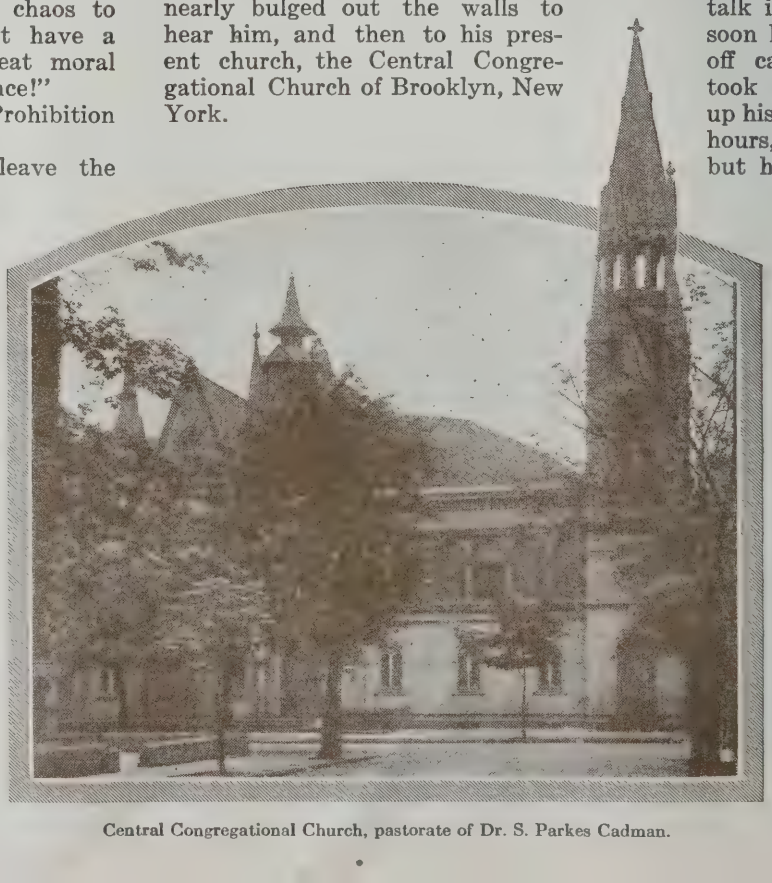
After it was all over, in our taxicab flight, I said: "You carried those answers off magnificently."

His response was, "I don't like to answer questions unless they write them down first. That is my usual rule. I made an exception today because it is the first May Day Question Box."

Dr. Cadman carries out this same question-and-answer period over the radio every Sunday afternoon from October to May. While he does this before a small audience of two thousand, a larger radio audience of two million are listening-in on these questions.

Down in Millbrook, his first charge, they got to calling this young preacher "Sam" before he was in town a week. There never was, and there is not now, any false dignity about Dr. Cadman.

After Millbrook he went to Yonkers, and then to Metropolitan Temple in New York City where the crowds nearly bulged out the walls to hear him, and then to his present church, the Central Congregational Church of Brooklyn, New York.



Central Congregational Church, pastorate of Dr. S. Parkes Cadman.

Dr. Cadman went to the M border as chaplain of the 23r York Infantry, where he tal straight to generals as he privates. One famous sern preached was on "Cussing" told that army that his serm intended for "generals or mule d

I Read *in* the Papers—

read in the papers that the New ork State Insurance Department is orking on a plan to exclude Lloyd's, ondon, the world's largest insurance rganization, because it has no licensed gents and also is without assets in merica that can be attached by a ing policyholder. It is claimed that loyd's accepts $50,000,000 in Ameri- an premiums annually, all of which is ent over to London. Suits of Ameri- an clients to recover disputed claims ust be brought in London. The nomalous position of Lloyd's was mphasized in a recent effort to sue the rganization in a Federal court that rew the case out.

read in the papers some memories f the late John Singer Sargent, the only rtist whose works were hung in the ational Gallery, London, during his fetime. Sargent was a true friend and entor to Robert Brough, A.R.S.A., a rilliant young painter who was killed a Scottish railway accident a number f years ago. Sargent canceled all his ngagements and hastened to Sheffield o solace the last hour of his young pro- gé. Robert Brough's work hangs side y side with that of Sargent in some of ne leading art galleries of Europe, and ne influence of the great portrait ainter can be seen in that of the young- man. I visited Brough's grave a ear or two ago. He lies in the shadow the old cathedral of St. Machar, berdeen, beneath a grassy plot over- oking the wooded banks of the river on, whose beauties he loved to depict.

read in the papers that New Eng- nd with 7 per cent of the population the country makes 35 per cent of the oes, and that Boston still retains its upremacy as the greatest leather mar- et in the world. Style is the outstand- g problem of the shoemaker; in one ew England center, for example, some 000 piece prices were fixed in one ear in the making of parts for new yles of shoes. The absurd feature of is style situation is that the human ot, a most important part of the phys- al structure, can only function prop- ly in one style of shoe and that of the ftest leather that individual require- ents will permit.

read in the papers a very striking arallel drawn by Dr. R. W. Mac- enna, a medical lecturer at Liverpool niversity, between his profession and iat of booksellers.

"A doctor," said he, "may not pre- cribe an infinitesimal grain of morphia r a patient dying of cancer without bserving a hundred and one irksome id gratuitous regulations, but you ooksellers are allowed to sell as much oral poison as you like, with no one to y you nay."

When a Photo Is Not a Picture

(*Concluded from page 14*)

until there was the less heavy dark shadow in the left-hand lower corner which balances the dark right-hand corner and the heavy ceiling and until the ivy had become a beautiful pattern of very deep shadows and lighter ones against the pale wall. Some darkness was needed, so much having been attained, to unite the font with the floor, and wall and the ceiling. It was secured by asking a man to walk into the composition and to place himself there where he could supply the needed bit of blackness. The matter of the foreground was as carefully studied; all stones were picked up and carried out of sight except the three which provide a point of interest on the left. If you would know how essential to the whole composition they are, obliterate them with a bit of paper of their value. You might also find it interesting and instructive to obliterate the accented spot of high light on the left, the highest light in the picture. The picture at once will become flat, lifeless. As the old sage said, and the student of photography increasingly learns, "Perfection consists of trifles, but perfection is no trifle."

The picture of the girl with the basket offers an instructive exhibition of how to overcome the difficulty, in a selected objective scene, of the presence of strong sunlight. In this picture the camera is going straight into the light. The girl is standing on an open porch, her back to the full blazing sunlight. To make the picture possible some coffee sacking was hastily procured, and three widths of it sewed together. The seams are visible and effective, and the expanse of sacking is fastened to the porch beams. The hat, filled with foliage, was used to balance the dark mass of hair, and it, together with the shadows of the tree trunk and branches cast upon the sacking, aids the white dress in making the picture one of lightness and summery grace. The dark shadow in the lower right-hand corner of the picture was essential and was secured by placing a bench in a position to throw its shadow there. The camera was pointed very high, at about the shoulders of the girl, by that means the face was accented and the lower portion of the photograph was given softness.

The picture of Lorado Taft and his "Fountain of Time" was taken in his studio; all the lighting is from the overhead skylight. The picture was taken at five o'clock because earlier in the day the salient shadows would have been unobtainable.

The dark trousers, the dark spot of the tie, and the shadow on the right side of the head dominate the pattern of light and dark. They center attention upon the small man who thus balances the heaviness of the shapes above his head, and they also hold the picture down, giving stability. Without them the composition is a floating, unstable thing. Next in importance to these three dark spots is the swinging line that extends from the right side of Mr. Taft's head to the left arm and crosses over to the toe of the right foot. That line and the dark spots make a unit of the picture with Mr. Taft the subject of the whole.

> If it had not been for French financial aid the American people could not have carried on the war of revolution. It was through Benjamin Franklin that these supplies of money were forwarded to the United States. Some of the original notes for these loans have been preserved. Next week THE DEARBORN INDEPENDENT will give the whole story.

Quaint Old Ipswich of the Dunes

(*Concluded from page 21*)

Many of the early comers were skilled lace makers, but the tools of their trade were lacking in the New World. Before long their friends at home smuggled over in firkins of butter bobbins and other small but essential parts of a lace-making kit, and soon an ingenious mechanic set up the complete machinery in Ipswich.

The undertaking thrived so greatly that the more ambitious planned to make their own silk and silkworms were brought from China in a pouch on the person of a coolie, and the slope of Town Hill was terraced and planted with white mulberry trees. The great mills of today can well advertise that Ipswich hosiery has satisfied for more than a hundred years.

Just below the mills on South Main street is the Old Stone Bridge, built in 1764, the first stone arch bridge in America. Colonel Choate was the moving spirit in its erection, and, as the story goes, he tethered his horse to a tree nearby to be ready to ride out of town in case, as the incredulous ones prophesied, the stone arches should not hold. Old Pomp, a jolly slave and the village rhymster, celebrated the event in this doggerel:

"Here's some more of Choate's folly,
He's torn down the Old Bridge
And turned out Walley."

Walley resigned from the pastorate of First Church the same year that the bridge was built.

Old Ipswich houses are a chapter by themselves.

Natchez—A Museum of the Old Sout

Preserves Many Picturesque Characteristics of the Olden Days; in the Land of Fire-worshipers Where Beauty Conquered Duty

By HARRY E. BARNET

"NATCHEZ, in the state of Mississippi, has parted with fewer southern characteristics of olden days than any town I know of," is the word you get generally when you're poking around below the Mason-Dixon's line, "and, at the start, it probably had more of them with which to part than any town I know." Consequently, you approach Natchez in a mood of heightened expectancy.

A place where the past lives, as far as it is possible for the past to live in the appearance of things, as well as in what people do and say as a matter of course, is a fugitive thing in the South. You have to do a lot of shopping around to find such places—generous slices of the romantic old South, that is to say. Economic shifts, and insistent new ways of living, are rapidly wiping out the visible history of the country that was before the surrender at Appomattox.

At sight, Natchez confesses a piquant life story. Men were picturesque there with wanton verve. The marks they made persist. True, some of them are faint imprints, others are delicate tracings. Broad marks show up in unexpected places, but if you follow long trails into the substance of what is before you, it is easy to freshen even the dimmest marks. Then you have a combination to which you unconsciously respond.

For example, the town bestirs your fancy. You half-imagine the silhouette of an Indian chief always at your elbow the while you loiter in the town. Natchez gets its name from the Natchez tribe of Indians. The country around Natchez was their country. And they worshiped fire.

"They possessed a tradition," is the tale of an old historian, "which unlike the traditions of any other nation gallantly ascribed the salvation of their race to a woman.

"This was that after the destruction of all the inhabitants of the earth save one family, which was about to die because of the continued darkness of the heavens, a young girl, spurred with the wish to save her race, threw herself into the fire which was used as a light.

"No sooner was her body consumed than she arose in the east, surrounded with such surpassing glory that her form could not be looked upon. Thus enshrined, she became the chief, her nearest family relation being elected her successor. Hence, was established a worship of the sun, and the living sacrifice of the sacred fire, together with the belief that so long as it blazed upon their altars the Natchez would be powerful and happy. Extinction of the fire would be the signal for their destruction.

Old home in Auburn Park.

"A brief period before the first explorers invaded their country, the signal appeared.

"A young chief became enamored of a beautiful maiden. His passion was returned. His interviews were stolen ones, and few and far between. On one occasion, when he was keeping the night watch over the sacred fire in the mound—which served as temple—he heard the plaintive notes of a day bird, and hastening to a neighboring grove, there he met his mistress, and changed the solemn vows of love.

"Returning to the temple, he covered to his horror that the flame expired during his long absence, the altars which had ever glowed the living fire were cold. And as sun illuminated the hills, and mad homes of the Natchez glisten i refreshing, and to then cred radiance there wa response of ascending sm of sacrifice. The c priests rushed to the ter

"Terrible, indeed, the wailings that esc from the soul-stricken shipers. The curse ha len upon the nation—ex tion stared them in the The young maiden was rificed, not only as a sac to the sun, but also tha surpassing beauty shou longer tempt the guar of the sacred fire to ne their vigils.

"After due ceremo the young chief was prisoned in the great m that served as a te there to remain unt wooed back the lost from heaven. But it w vain that he essayed trifling and easy tas lighting the combustib rapid friction. C whelmed by religious his strength of arm app to have departed. when from long and p labor the fire was abo descend, a tear of regr the memory of his mi would fall upon the ig wood and leave the minable task to be renewed.

"When the chief recovers th he will again appear at the and the Natchez in all their f glory will take possession of the homes."

Natchez has had its years o mendous exaltation, and its yea tremendous woe. It's about the you think in connection with the of the Indian chief, if you separa idea of punishment and forced toi his task, and center both upon th tation that brought him to whe fancifully is, as well as upon his sp perseverance.

Natchez was settled as pa French colonial development two before New Orleans was located. It said Natchez was to be the se

vernment. But, later, D'Iberville unded it at New Orleans, and Natchez as garrisoned. It was an outpost—hopes of becoming the Paris of Amer- were dashed.

Like the chief, Natchez kept at it, d, unlike the chief, it had success. It came one of the most important wns in the Southwest. Then it out-geously flirted with speculation. hen the bubble burst, Natchez was wn and out. The town set to work recover its prestige. Cotton-plant- prevailed, but war between the tes gave it a setback. Once more the wn picked itself up—and, in recent ars, the boll weevil relapsed its prog-s. Nowadays, Natchez is at it ain. This time, it is development of tensive commercial truck farming, d, from the outlook, Natchez is about see the sacred fire descend, for climate d soil fertility, in the Natchez coun-, will produce three crops each year, d, on a ten-acre plot, any reasonably lustrious man can earn more than a mfortable living.

That aside, the spirit of perservance the face of disappointment dominates itchez. You see it and feel it every-ere you go. It keeps the Indian chief d his efforts always in your mind. u fancy the spirit must be an inheri-ce along with the name. But this rit isn't of the fiery order. It isn't nething that spends itself in periodic ies. Just a quiet going ahead, so in itchez you are not confronted with ns of woes, as you are in many south-n towns. Natchez hasn't let itself go wn-at-the-heel, and bedraggled, from appointment. On the contrary, the vn keeps its best foot forward. Its eets are wide and clean. Its build-s are like time-stained furniture—t not of the junk shop.

Too, you hear little of the woes of tchez, unless it's by way of amusing niniscence. War between the states, cite an illustration.

She is a dear old lady—a southern man of a type little known adays in the North.

An Incident of the Civil War

"When the Yankees were stationed here," she remarked with a smile, "one of my Confederate ers sent me a box of writing paper—was very scarce then, you know, and ent for the paper, but the Yankee cer wouldn't give it up.

" 'Tell her if she is very pretty,' he t word to me, 'I'll give her a sheet at ime, if she'll come after it.'

"I wanted that writing paper," she nt on, "but there were no dress goods be had, and I simply had to have a y dress to help make an impression. had some very beautiful heavy cur-ns in our home. I made a dress out ne of them—a very handsome dress, , it was for the times, and arrayed the glory of that dress, I appeared re the officer, and asked for a sheet my paper.

"He looked at me, and gave me the whole box, without saying a word. That took the conceit out of me. My folks never stopped teasing me about the event."

Years of tremendous exaltation are the past that is uppermost in Natchez, and, because of this past, you think to yourself upon short acquaintance with the town, What a giant's checkerboard is Natchez! Loitering in the town, the fancy grows—it's easy to vision a strapper of the water realm, reared, and facing across Natchez a massy opponent, himself sprawled in wondrous topography.

Imagery of the giant from the depths, reared, and at the game, is foundationed by the location of Natchez upon bluffs overlooking the Mississippi River. Topography in which the other large one of your reverie is a-sprawl was described by explorers in 1700. Practically speaking, the description holds good today.

The Spaniards Laid Out the Town

"From the landing place, one ascends a very steep hill, about 150 fathoms high," runs this writing of old. "On top, one finds a country of plains and prairies, filled with little hills; in some places, groves of trees, many oaks, and many roads cut through and going to hamlets, or to cabins. Those who traveled three or four leagues say they found everywhere the same country from the edge of the hill. . . . The country is very much like that of France."

A Spanish colonial governor laid out the town. He located the church in what was intended to be the center of the town, and from the church door he planned Natchez in squares, the area, a mile square. Natchez was built according to plan. So it remains, still a mile square, the town still a series of squares. Buildings are about of a height —thus completing no mean surface for the fanciful checker game of the giants.

Leaving fancies that are conjured by facts, and sticking strictly to the latter, the biggest part of the romantic old South was an intangible something. "Not a social system at all," you're told, "but an atmosphere—'an unbought grace of life.' " Speaking generally of the old South, it ascended from conditions that long ago came to end, as the flame of an oil-burning lamp flickers and departs, when its reservoir is drained. Yet, the atmosphere hung on, thinning as the years piled up. Economic shifts, and insistent new ways of living, are fanning it along in the wake of the tangible old South. A breed of brusqueness alien to the South is taking its place.

But in Natchez you find the old atmosphere rather dense.

"Everybody here takes the time to stop and talk with you, and to be friendly," is an explanatory excerpt from a conversation. "I guess, because we've been bred to it. We're all about alike. Nobody tries to shove the other fellow out of the way. And we seem to get along just as well as if we did."

That gives you a slight hint. No one can fully describe the graciousness of the people of the town and its country.

And probably the "unbought grace of life" is not so thin in Natchez, as elsewhere, because it is toughened by ancient environment. More difficult to separate from its place, therefore. About 1765, Natchez became individual as far as social and ethical things are concerned. Young people of the town were educated in New Orleans, where they mingled with the French nobility and gentry then in the city. In that way, the polish of France made its way into Natchez. Marriages followed, as a matter of course. The result was the Anglo-Norman people of the Natchez hills. They were known the world over for refinement, culture and elegant modes of life. Their "unbought grace of life" was added to the general grace of life of the old South, making in Natchez a two-part, resistant affair of the latter.

Few cities of the old South could claim the same environment of distinctive homes as Natchez. For one reason—and again falling back upon ancient writings—"in probably no other part of the United States was wealth more rapidly accumulated than by the pioneers in the American settlement of Natchez." Natural advantages, and slave labor, make cotton-raising amazingly profitable. These attractions brought a high-class citizenship into the Natchez country. Planters were people of taste and education, and they accumulated big libraries, as well as immense art collections. The architecture of these homes show the refinement and culture that distinguished Natchez.

"The majority of these magnificent old homes—big rambling affairs, you know, were not in Natchez," is another explanatory excerpt from a conversation, "although we have a number of them in town.

Many Fine Homes Were Destroyed

"Rich planters did not live in town. They came here, but they didn't think it the thing to live in any town. Nearly all of them had their residences on their plantations, and, of course, a great many of these fine old homes that, incidentally, were known the world over—because Natchez and the vicinity were visited by noted men from everywhere —have been destroyed by fire."

Nevertheless, in these days, there are enough of these homes existing to satisfy any reasonably minded questing wanderer on the hunt for environment of the romantic old South, because Natchez was the center of them; and structures of the kind are becoming scarce in the South. Too, they're inhabited, mainly, by people who were born into the traditions of Natchez. Yet, occasionally, you hear a sigh from one of the younger generations, and this remark, "I wish I could live in a compact four or five room flat!"

One of the most ambitious southern homes ever planned in the vicinity of Natchez, and probably in the entire South, stands uncompleted just beyond the outskirts of the town. Approaching it, you get the best view of the sunken roads of the Natchez country. Instead of ascending hills, and decending them, cuts were made by the original road builders—whoever they were, red men or white men—through these hills. There are no rocks, stones or pebbles in the soil about Natchez, so the cuts were easily made. The sides of the cuts are covered with flowering vines; great trees line their brinks—riding through one of these cuts is like scooting through short stretches of fairy playground. Road surfaces are as smooth as billard tables.

Entrance from the main road into the grounds in which stands the uncompleted structure is along a private road, also cut through hills. The house itself stands in a grove whose trees are enveloped in Spanish moss. The house is six-sided, and built of brick. Surmounting the structure is an enormous copper dome. The interior is so arranged that an orchestra playing in any part of it distinctly can be heard in any other part. Magnificence to match Oriental and European homes of royalty was planned. Fireplaces were to be of Italian marble. Bases were set for ancient Grecian and other statuary. But war between the states intervened, and the house never was completed.

There has been strange fellowshipping in Natchez. The town started as a French settlement. Then, for a time, it was under British control. Settlers during that period were of strong character. As the center of a Spanish colony later on, Natchez was brilliant. Then the town was laid out in checkerboard squares. "Immigrants who came at this time brought with them culture, social position, enterprise and considerable wealth, and these elements controlled and characterized the community." Natchez, however, reached its highest point under American control. Here and there you find comparative touches about the town that betray this fellowshipping more than in any other respect, as in short section of a residence street. It can be duplicated several times in Albany, New York.

Probably the best notion of Natchez as a generous slice of the romantic old South is gained when you sit with the whittlers in the police station. Whittling, it should be said, is a southern, and a Natchez old-time habit—slowly dying out. You see men walking about with pieces of wood protruding from their pockets—and, indeed, the whittling habit was, at times, a good indication of how the land lay, if you were seeking a favor.

Library at "Arlington."

Witnesseth: one of the leading bankers of the town.

"When he was an ardent whittler and when he was shaving it off in chunks, and pushing it away from him, never bother him about a loan. Stay away from him," is the story you hear.

"On the other hand, when he was drawing it off, and taking it off i curls, very carefully, why, it hard to get a loan, if you wante

The wood is always red ceda houses of colonial, and later-da struction were largely built of re and the whittlers watch every ol that is torn down. They secure of joists, and beams, from the d tled structures, and saw them in foot lengths, which are passed as rare presents among their fri good whittling timber is scar must be of the proper dryne grain to be satisfactory. These are carefully guarded, and sli split off as they're needed. In th station, for instance, cedar chu longing to the whittlers who there are kept under lock and k

"GOLD and silver are not *intrinsically* of equal value with iron, a metal in itself capable of many more beneficial uses to mankind. Their value rests chiefly on the estimation they happen to be in among the generality of nations, and the credit given to the opinion that that estimation will continue. Otherwise a pound of gold would not be a real equivalent for even a bushel of wheat. Any other well-founded credit is as much an equivalent as gold and silver; and in some cases more so, or it would not be preferred by commercial people in different countries. . . . . Holland, which understands the value of cash as well as any people in the world, would never part with gold and silver for credit if they did not think and find the credit a full equivalent."—*Benjamin Franklin.*

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

Presented in This Issue

Mr. Ford's Page this week deals with the true character of patriotism.

This is the Fourth of July Number, and articles of ational interest find a fitting place herein. The young onnecticut school-teacher who made himself immortal one brief scaffold sentence—*"I only regret that I have t one life to lose for my country"*—has at last had his ace of execution identified by an old memorandum ok found in London. Nathan Hale was hanged in at is now City Hall Park, New York. (p. 20)

All readers, whether they like history or not, will see r the first time in any publication, a facsimile of the entical notes which passed between Benjamin Franklin d the French king when loans were made to the strug- ng colonies of America. Even the United States Treas- y cannot show such documents as we produce here. It a "scoop" in history. ese documents are pre- nted here through the urtesy and public spirit a direct descendant of e great Franklin. In- dentally, this article es new information on e extent of French as- tance to the American olonies. (p. 4)

It is good betimes to k upon the sturdy tree ence we have sprung. "A nation born in a day" ade July Fourth an anni- rsary for freemen every- ere. Yet there were g preparations, and ese are rehearsed in "The 56 of '76" by Mr. wden. (p. 12)

The part of the South- ern Colonies in attaining merican independence is alled in the action of e little town of Sunbury, eorgia, in leading the re- lt against King George II. What this thing eans that we enjoy to- dy, what it cost, is clearly dicated. (p. 24)

America's dress goods and style declaration of independence is another advance worth celebrating. It is largely the American woman's declaration. Jean Mowat, who knows about such things and tells them interestingly, writes about our growing self-reliance in the field of fabrics and dyes. (p. 22)

Paul Honore, whose woodcuts have adorned our pages, is here described by the author whose books and articles he has so worthily illustrated. (p. 6)

Again that very sensible woman, Mary Willis Shuey, takes some stale platitudes and shakes them. How many "White Hyacinths for the soul" are possible on an ordinary income? And what are "Hyacinths" anyway? In order to reduce our already mountainous mail, the Editor would like to hear from every woman who does *not* agree that this article is uncommon common sense. (p. 2)

Do we all tell the truth? Can we? Should we? Do we want to? Is it true that we are all untruthful? Very delicate questions. (p. 3)

Have you a little Humor in your home? America's famous expert in humor continues his success in reducing this elusive subject to common terms. (p. 16)

Characteristics of the Slavs completes the study begun last week by Professor Jenks. (p. 15)

English as she is pronounced (p. 8); a city of ruins and roses (p. 32); the evolution of the bathing girl (not in the Tennessean sense) but as to her costume (p. 28) are articles of interest.

Loaves and White Hyacinth

Mahomet Might Split Fifty-Fifty With His Soul, But He Married Money

By MARY WILLIS SHUEY

EVER since Elbert Hubbard advertised the precepts of Mahomet we have heard this quoted in sermons and broadcast by shirt-manufacturers: *"If a Man have two loaves of Bread, let him sell one, and buy White Hyacinths for his soul."* And it sounds so very noble that we take it for granted that it is a most estimable thing to do.

But I've been making out family budgets, and I have come to feel mighty sorry for the family of the man who spends half his substance for his spirit's sake! We don't allow that much in budgets for the souls of those of moderate incomes, even-as-yours-and-mine. Fifteen per cent is nearer the proper amount.

Of course, souls, as well as incomes, vary, and no two of us want the same things. We do not know what Mahomet required to satisfy his—but since those loaves really belonged to the Widow Khadijah, the chances are that she felt slightly interested in their disposal!

Mahomet settled his own bread-and-butter problem by marrying a wealthy widow fourteen years his senior—and promptly became moved by soulful impulses. And it is true even to this day that we can buy White Hyacinths most readily with *other people's money.*

If Mahomet had gone on driving camels and working up a healthy appetite we question whether he would have spent half his wages for his soul's sake. If he had married a woman who had no money, and had supported several children on his driver's earnings, he would probably have preached: "Charity begins at home." Our logic and our beliefs are that closely derived from our own lives and experiences!

Perhaps that is the reason I am not willing to split fifty-fifty with my soul. I know little of large fortunes, and the man who has a whole bakery from which to draw, but I *do* know about the two loaves of moderate incomes, and we can't split that way.

"Moderate incomes" do not presuppose moderate souls. The term itself is as flexible as "middle-age." Few persons admit that they are over it, and most of us are not even going to see that we have arrived until we are well along. To the majority of us "moderate income" means just what we ourselves have.

As long as that quotation was left to Mahomet and the advertisers there was nothing personal in it. But now we are beseiged on all sides by advocates of the "higher life." We hear that we are a nation of gross materialists, that we spend all our incomes for physical things, and leave nothing for the spirit.

We are told that we have left the simple life of our forefathers, and are going a spendthrift way to ruin and destruction. The younger we are, the worse we are! True culture, and all the White Hyacinths, grow in foreign soil.

But whenever the talk warms up I get out a pencil and do a little figuring. That keeps me from signing any checks for unheard-of republics. I may not be an authority on White Hyacinths, but we've budgeted ever since we married, seven-and-a-half years ago, and I can tell about living costs.

We can't have three small sons, buy our own home, have well-balanced, appetizing meals, comfortable, *livable* furniture, a cook, a car, clothes that increase instead of lower our self-respect, sufficient insurance, and a margin of savings—and then invest heavily in White Hyacinths. And I'm of the opinion that the things we feel are necessary for our material happiness are important things, even if they be classified under "Higher Life

Too many persons who pre the amount we should spen "higher life" have anemic-l children! They make me want back to the kitchen and giv four-year-old the bread and butt jam he is asking for, even if it tween meals. Instead of want buy White Hyacinths I want sure the children have enough and oatmeal and spinach, and t have a good, thick steak for So far no one has proved th proper number of calories of re interferes with spiritual develo

There was a New England who taught that plain living high thinking. If you'll look ove of the Thanksgiving menus o time and locality, however, conclude that "plain living" t was far from roots and herbs. plicity is in as good taste now as then. "Food for thought" is material, but even genius usua some hard-headed relative wh that the kitchen has meat and tables, and that there are clean on the bed.

It may be that I am earth-bo soul. I know there is nothing e in shoes for three pairs of bus feet. We've had to stick close t we who have married on small s and made the most of them. s It True We Are Untruthful?

Where Do People Get Their Facts, and Are They Facts When Thev Get Them?

By W. TEIGNMOUTH SHORE

ON'T shout at me because I maintain that very few of us tell the truth. It's not because we won't but because can't. Except upon proper occaons when I deliberately prevaricate, myself try to tell the truth. I tell iat I believe to be the truth, and en a minute later, or an hour, or a nth (or perhaps never), I find out at what I had believed to be the ith was in reality untruth. The truth is at it's always very difficult and most ually impossible to get at the truth. iat's where the trouble is.

"What is truth?" asked Pilate, sting. No one has yet given a satisctory answer to his question. Do u know what is truth in general? lon't. I am aware of my ignorance, d am so far on the way to salvation.) you know what is the truth about ything in particular? I am never cksure myself; I've so often found at I've been mistaken. Human idence, written or spoken, is so :en all at sea. Circumstantial evince, the testimony of facts, is far ore trustworthy. As a rule we see d we hear what we wish to see and ar. Our faculties frequently lead astray. We draw wrong conclusions. loof of this is to be found in the law urts every day, witnesses bluntly ntradicting each other and themves upon matters of observation. lit I am not setting out to write a atise on truth or upon the fallibility human evidence. It's enough now t say that we do well not to believe en half of what we see and very little what we hear. It's difficult to get at fts; without them we cannot tell the truth.

ittle Encouragement to Get at the Truth

And when we have found facts as often as not we don't know how to aw right conclusions from them. iat's a fact. We stare at the world trough others' eyes and hear with ners' ears. We don't do much real lking or listening for ourselves. iat's another fact. We see the world s we are told to see it; we hear what e are told we shall hear. Few of us come individuals; most of us are eep who follow the leaders of the ck. All that is bad. Those who do ake free are either glorified or crucid, mostly the latter. Indeed, there's le encouragement to get at the truth to get it out.

What becomes, for example, of a newsper editor who insists on his paper nding out the truth, the whole truth d nothing but the truth? Such a n doesn't often get into the editorial air; when he does he's got out of it uble quick. Fired! One word is said to him: "Git!" He's busted for life, unless he reforms his ways and becomes as other newspapermen. A nation has the newspapers it deserves, no better and no worse. Newspapers exist to fill a demand; they live to please and must please to live. The newspaper Napoleon is the man who knows what's wanted and provides that, and that only. That was the secret of Lord Northcliffe's prodigious success. He kept his finger daily, hourly, on the pulse of the public and handed out the stuff he knew would be demanded *tomorrow*. He took care to find out which way the wind was blowing. From this policy he broke away once; when he went for Lord Kitchener during the war. He was in the right. He and his paper suffered for a while. Then the public learned that he was right and took him and his paper to their hearts and homes again. But he had taken a risk, a bad one. Newspapers cannot afford to teach or to lead the public, or to precede public opinion. They must follow while pretending to go before. Newspapers are more hurt by suppression of the truth than by any deliberate lying. Part of the truth is as bad as a whole lie.

Talking Stark Nonsense About Degeneracy

What on earth am I driving at? This. The public too commonly take their facts from the press and their opinions also. That's very bad. I'm shooting at the fuss about, the gross exaggeration and misunderstanding of some recent disgraceful cases in American and British courts, fostered by the press. It's not for me to talk about the two young Chicago murderers, who should long since have been dead and buried. Only I will say this much; that their performances do not justify us in writing down all rich young Americans as degenerates because some few are so. You might as well say that all poets are naughty because Byron and Shelley kicked over the traces. Not much! But many in England, and I fear a good many in America, are talking stark nonsense about the degeneracy of blue-blooded, titled and wealthy Britishers. The truth in this matter is not seen partly because it is not really looked for, partly because the newspapers hide it, cover it up, don't give it out—because there's not any vigorous demand for it and because in fact truth is generally less strange, striking and exciting than fiction. It pays newspapers because it sells them to make a fuss when the Duke of Blankshire does what he ought not or when Lady Lightways runs away with her chauffeur or loves not wisely but too often. If a millionaire goes on the razzle-dazzle it's a spicy news item and is reported at length; when a pauper gets drunk it is not a bit interesting to anyone except himself and his undistinguished circle. Looking back over a number of years it is wonderful to me how few not how many have been the *cause celebres*, which is French for "unsavory cases," among the well-born and the rich. Of course, when they do come along the majority of newspapers make the very most of them, publishing as many nauseous details as they dare, shouting at the top of their voices, the result being that the public ear is stunned and the public mind is muddled. A bad smell gets at more noses than does a nice one. Now and again comes a sensational murder, generally committed by otherwise quite uninteresting persons. More noise and clamor, until the public comes to believe that crime is on the increase, whether it be so or not. The newspapers make such a hullabaloo that the modest voice of truth is unheard. Truth is a modest woman; keeps in the background; it is even stated that she dwells at the bottom of a well.

We recently had a case in the English courts in which an Indian gent of high degree was proved to have been heavily blackmailed because he got mixed up with a real lady. The public jeers at him, asks why he wants to come over to us and run amuck among unsavory women; wonders how many more there are of his kidney. Are there many more so rotten and such rotters? The public doesn't size up the facts, doesn't even look for them; is ready to condemn the whole congregation for the sake of one; the whole flock must be black because there was this one black sheep. Is that the way to get at and to tell the truth? Not much.

Washing Dirty Linen in the Courts

Then there came the Dennistoun case, in which Mrs. Dorothy Muriel Dennistoun sued the husband she had divorced, now married to Almina, Countess of Cardigan, for the breaking of an alleged agreement made by him to support her. There is no need to stir up the muddy details of this case, which were smelly, unsavory. One exclaimed: "What a crew!" This rotten scandal has aroused in many quarters the old cry that the British aristocracy has gone to the dogs and that "high" is really "low" life. That's not the truth.

People don't come to the courts to wash clean linen. (*Concluded on page 14*)

How France Aided American Liberty

"Poor Richard" Asked and Received Money to Carry on War of Independence

By LOUIS C. KARPINSKI and CHARLES BACHE

(Copyright, 1925, by Franklin Bache.)

A note to France for a loan of 250,000 livres, at 5 per cent.

WAR is an expensive institution, turning men from productive enterprises to destructive activities. Not only the actual instruments of warfare are used up but all the nation's resources of food, of transportation, of clothing, and of finance are immediately devoted, in the event of war, to the successful prosecution of the same. One hundred fifty years ago our colonial forefathers embarked upon such an enterprise, devoting themselves without reservation to the cause of freedom and, in a measure, pledging future resources to attain the victory.

The financing of the American Revolution was an absolutely essential factor in the attainment of victory. At the outbreak of hostilities not enough powder and guns were available to continue for a year and the American sources of supply were utterly inadequate. Washington wrote at Christmas time in 1775: "Our want of powder is inconceivable," and three weeks later not a pound was left in his magazines.

Recently the historian, O. W. Stephenson, at the University of Michigan, made an exhaustive study of the sources of the powder used by the Americans in the first two and one-half years of the conflict. Mr. Stephenson has established from newspapers and from letters and official documents of the time that two million and a quarter pounds of powder were used in this period. Of this amount two million pounds, ninety per cent, came from France while less than one-tenth was produced locally or was on hand from the English war with France of 1753-1762.

No historian today would dispute the fact that American success at that time would have been impossible without this aid from France.

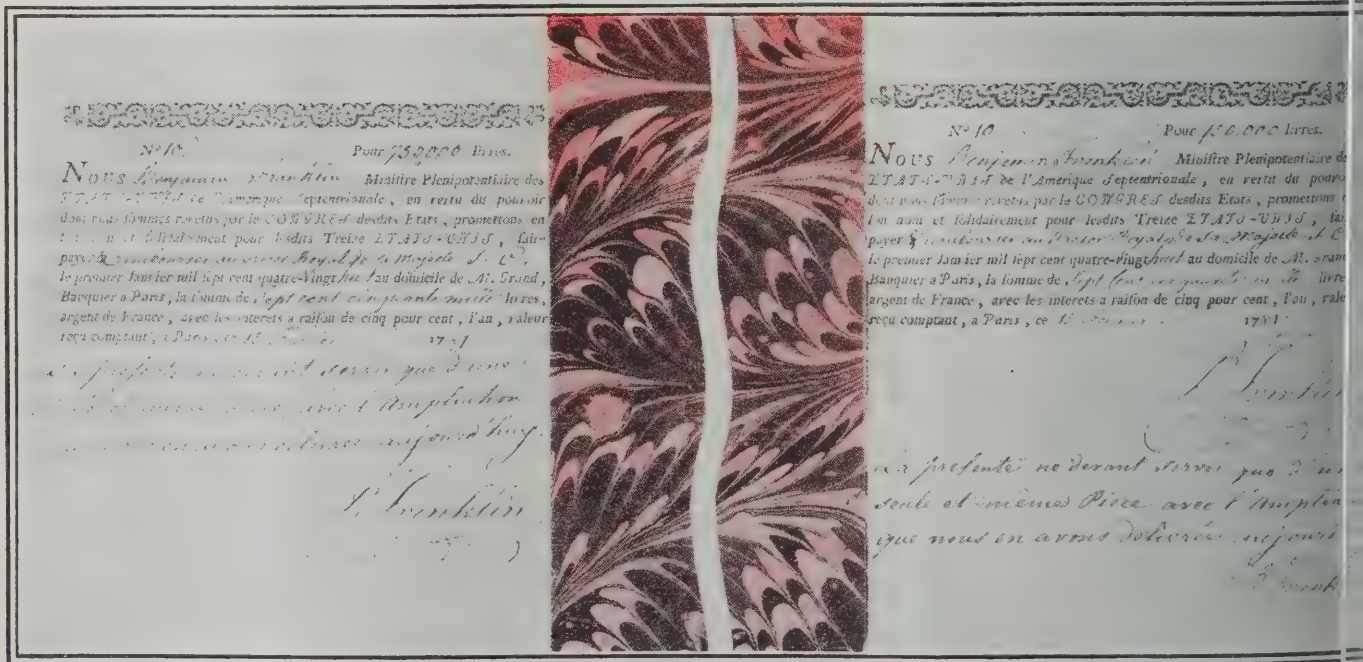
In financing the American Revolution all the neutral states of Europe were approached for loans. They were overrun by agents both of Congress and of the separate states. But the foreign loans upon which the success of the American Revolution was based were made only by and through France. Records of foreign financial aid show only French from 1776 until 1781.

Just about the time of the Battle of Saratoga, late in 1778, which was the first real gleam of sunshine for the American forces, Benjamin Franklin was at a dinner where someone remarked about the "fine spectacle" which the war made. "Yes," Franklin remarked, adding characteristically, "but the spectators do not pay." The surrender of Burgoyne came at a time when the French support have weakened. Beaumarchais Passy with Franklin and imme drove posthaste to Paris to Vergennes and the King. In hi Beaumarchais broke an arm he carried the news.

In 1881 Rafael A. Bayley, United States Treasury, publish special report in the U. S. Ce 1880 a work, "The National L the United States, from July 4 to June 30, 1880." Bayley not in addition to loans, *French s or gifts were granted* between 1779 *to the extent of ten millions*

On October 2, 1780, in a l John Jay, Franklin stated:

> "At length I got over a R tance that was almost invincible made another Application to Government here for more M . . . my Memorial was receive the kindest and most friendly ner, and tho' the Court here is not its embarrassments on Accour Money, I was told to make m easy, for that I should be ass with what was necessary . . . I much pleased with the generou



Among Benjamin Franklin's papers, in the possession of one of his descendants, are duplicate copies of some of the notes made on behalf of the United State given to the French Government. The notes were printed in duplicate. These were "indentured," cut apart with an irregular edge for identification. notes have never before been reproduced.

haviour just experienced I presented another Paper, proposing in order to ease the Government here (which has been so willing to ease us), that the Congress might furnish their Army in America with Provisions in part of the Payment for the Sum lent us. This proposition I was told was well taken; but, it being considered, that the States having the Enemy

gle draft showing how Franklin and others gave their fortunes to their country.

in their Country, and obliged to make great expenses for the Present Campaign, the furnishing so much Provisions as the French Army would need, might straiten and be inconvenient to the Congress, his Majesty did not at this time think it right to accept the offer. You will not wonder at my loving this good prince. He will win the Hearts of all America."

Indicative of our absute dependence on ench aid to continue war to a successful end the following expression m a letter of General Washington:

"Our present situation makes one of two things essential to us; a Peace, or the most vigorous Aid of our Allies, particularly in the Article of *Money*."

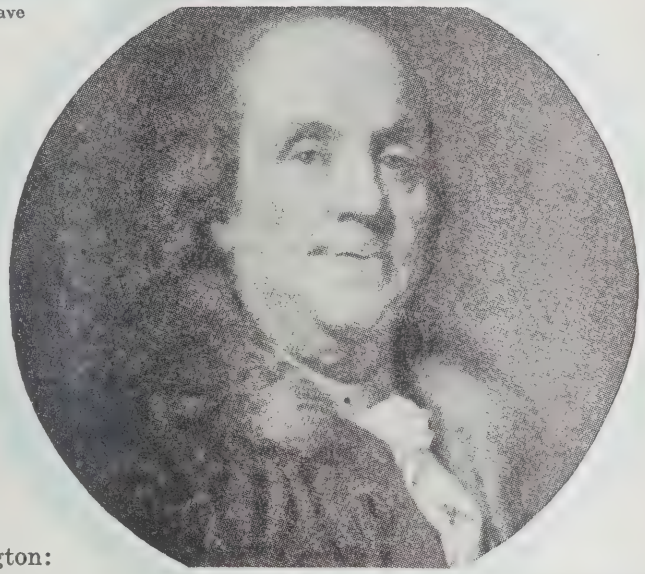
This letter of Washington's was oted by Franklin on February 13, 31, in transmitting a letter from ngress to the King asking an addi- nal loan.

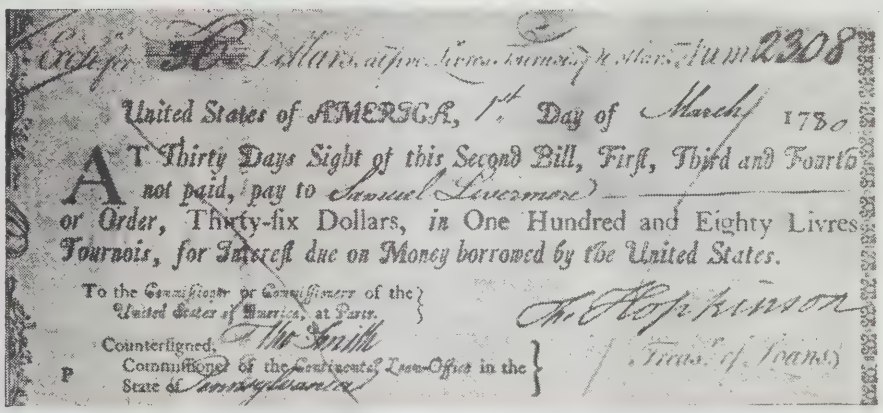
To Samuel Huntington, on March 1781, Franklin wrote in connection h the request from Congress for oan of twenty-five million livres:

"He (Vergennes) assured me of the King's good will to the United States; remarking, however, that, being on the spot, I must be sensible of the great expense France was actually engaged in, and the difficulty of providing for it, which rendered the lending us twenty-five millions at present impracticable . . . but that . . . his Majesty had resolved to grant them the sum of six millions not as a loan but as a free gift."

Concerning these gifts Franklin wrote to Robert R. Livingston on August 12, 1782, as follows:

"All the accounts against us . . . made the debt amount to the even sum of eighteen millions, exclusive of the Holland loan (ten millions), for which the King is guarantee. I send a copy of the instrument to Mr. Morris. In reading it, you will discover several fresh marks of the King's goodness towards us, amounting to the value of near two millions. These, added to the free gifts before made to us at different times, form an object of at least twelve millions, for which no returns but that of gratitude and friendship are expected. These, I hope may be everlasting."





United States of AMERICA, 1st Day of March 1780
AT Thirty Days Sight of this Second Bill, First, Third and Fourth not paid, pay to Samuel Lovemore

Treas. of Loans.

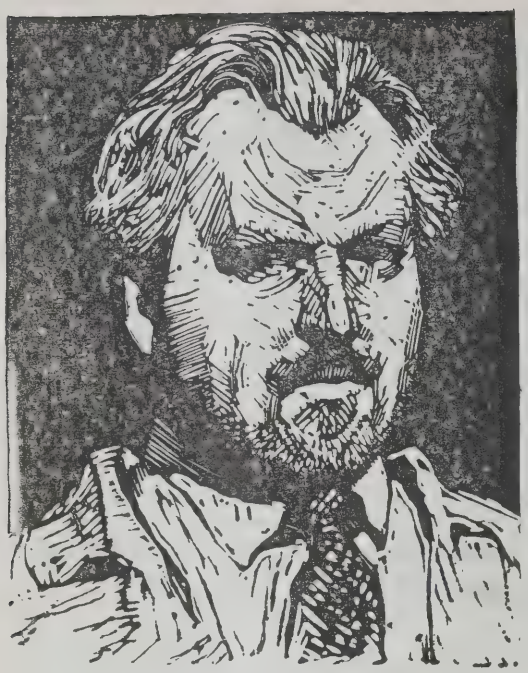
Another Revolutionary contribution. Circle—Benjamin Franklin, after the famous portrait by Duplessis.

Subsequently, on March 7, 1783, after securing in times of great stress six more millions, Franklin acknowledges the gift of the first year's interest on this new loan. French loans and gifts were the only foreign aid received except the one million from Spain, granted at the request of France. Dutch loans began first in 1782, after the preliminary peace negotiations.

The French gifts and loans to America were due largely to two men, Caron de Beaumarchais and Benjamin Franklin. The one represented the element of comic opera in a highly successful rôle while the other represented the American democracy, to the awakening public of France, a symbol of a new age. Both were absolutely devoted to the American cause and probably neither would have been as effective without the other.

The claim to fame of Beaumarchais in the field of comic opera is not to be disputed. Figaro is a character bearing striking resemblance to Beaumarchais himself. Not only on his own part did the author prosecute romantic escapades but on behalf of the King and the Court this son of a watchmaker participated in intrigues and the aftermath of romantic meetings. Upon this type of material are founded his plays, rendered immortal also in music by the genius of a Mozart and a Rossini. These plays contributed no little to the French Revolution.

The time of 1776 to 1779 was not a time when the Americans could pick and choose their friends, and the Comic Opera King served them more devotedly and more effectively than had he been a great statesman. Most fortunately Beaumarchais had the ear of the King and the facile pen which enabled him to put the American cause effectively before that amiable monarch. These efforts began in 1775 and were crowned with success in the recognition of the *(Concluded on page 30)*



Woodcut of Paul Honore, by himself.

Paul Honore's Wor as Wood Engrave

By CHARLES J. FINGER

THIS is why I went to Detroit to see Paul Honoré, who, though he had illustrated three of my books, was almost unknown to me.

A very earnest young man, a little wild-eyed and odd as to his hair and necktie, told me one day that I was hopelessly in the tail of the procession as regarded ultra-modern art, and advised me to talk with some up-to-date artist. That was after the young man had experimented with me in the interests of what he called esthetic innovation, and the manner of his experiment was this. He held up a picture made by Dasburg, a modern of moderns, telling me that the artist had eliminated the recognizable object as detracting the eye. I quote him. When I burst out with a question, asking him what it was called, he said my question was foolish. Then, immediately, he asked me what I made of the picture and, after long consideration, I made answer that it seemed to represent broken eggshells floating in a kind of void. He put the picture down, telling me, quite impatiently, that its real purpose was to stimulate sense of the esthetic quality and said that the work or art might be entitled "Improvisation." Then he went on with the next, and, a little scornful, I think, held up something by Arthur G. Dove, calling on me to give it a name and to speak quick, without thought. He wanted, he said, my fresh impression. So I hazarded a guess saying that it might be a tepee in a cyclone; then came a swift second thought, and I said, earnestly, that perhaps it was microbes attacking a phagocyte, highly magnified. Again I was wrong. It was, he told me, "Nature Symbolized." There were other pictures, things weird and wild, helter-skelter arrangements of globes and segments, eccentricities which he said were cities and landscapes; then, with a kind of sweet resignation he put away his portfolio and told me to see some modern.

I chose Honoré, mainly because I knew that I could trust his pictures and understand his language. There was another reason, too, and it was this. Once, for the *Century Magazine*, he had illustrated one of my adventure stories the scene of which was set in Tierra del Fuego. Now that being an out-of-the-way land, desolate and forbidding but with certain characteristic features, Honoré might easily have slapped things together casually, flinging into the background mountains and precipices with reckless aim, and, given good luck, might have got away with it. But he did nothing of the kind. He indulged in no unrestricted flights of fancy but held true to my description and to the text of the tale. Certainly, for my part, the appearance of the place was indelibly stamped on my memory for I had been shipwrecked there, had suffered cold and half-starvation. So text and illustrations hung together, and well was it that they did. For, in the same issue was an illustrated article by Rockwell Kent written about and from that identical corner of the world, nor did the Kent pictures conflict in any way with those made by Honoré. One artist bore the other out perfectly. I did not have to look at either Kent's nor Honoré's pictures with mistrust.

Well, Honoré and I had a long talk and I felt better after it. I saw dozens and dozens of his pictures, and some made by his pupils, and in each and every case I was able to tell the flowers from the birds, and the houses from the horses. Honoré no incomprehensible jargon, ma explanatory lines in the air wi thumb, was as sane and under able as an ordinary business mar workman. His studio was in a of converted stable and was clu with screens and drawing pape plaster casts. There were a few uncomfortable chairs and a uncomfortable sofa by way of ture. There was a great fireplac seemed never to have known an but the chill comfort of burned ping paper and old newspaper envelopes and advertisements. his back to that fireplace, a li table before him, Honoré sat— within an ace of six feet in h deep-chested, light-bearded, an imaginative fellow with a quic and a swift accurate hand. talked he produced, almost magician, sketches and pictures, them without hunting for them that table just as a ma takes the to requires from And there w me, somethi most uncan times when h duced pictu this and that canny, becau though we worked on th job with hu of miles sepa us, and witho respondence, were pictures things I had ined and vi about, almo actly as I h agined then ways he had the spirit thing. Then pleased m mensely, wa evidence of a taking acc Never did he sixteenth-c character eighteenth-c dress. Alwa had gone in dependent vi tion. That I a glance. nger, Honoré had taken the trouble see and to go over the convict ship. had handled and measured the nor the bandit made and wore. So, ually, his picture of the ironclad shranger is far more accurate than e pictures which appeared in the strated journals of Kelly's day. ose were drawn from imagination. Then there was the agreeable live- ess of the man's work. Also the sence of the monotonous stiffness so en found in woodcuts struck me. en there were effects of light and ade, only to be gained, I imagine, deliberate workmanship. Best of was his power of expression. He owed me pictures for "Romantic scals." There they were; the poet- ate earnest and imaginative; the ly harum-scarum heir to great ates who became chimney-sweep; e self-esteeming constable who craved be admiral; the artful and foxy ud who said he could rejuvenate the rn-out—there they were, fellows compounded of ferocity, imagina- n, daring, artful artlessness. In es and scratches made on blocks of od there was character. Did he aw a highwayman clearing a five- rred gate, the action was there. oking, you felt the rush of air, the ift movement, the gathering of the rse for the leap, the beating of rapid ofs. His ships move with majesty d the flashing spray is at the bows them.

I hope I am not superlative. For I not trying to set Honoré on any ely height, nor endeavoring to wn him with any undeserved rels. But I am phasizing the t, as sharply as an, that he is ound man and ist; that he is e with a deli- y of responsi- ity; that he is e of many fol- ving his bent l profession m whose work trust does not liate; that he is a skilled workman, ar-seeing and ll of integ- y, who shuns ackery and per- nious sensation- m. I lay stress o that last, main- because there are faddists a-plenty circles artistic just as there are in cles literary and scientific and educa- inal. And the faddists make most nse and attract most attention, just a a noisy, clattering, loose-geared, adjusted traction machine on its y to the junk pile makes more dis- bance than a hundred smooth-run- g cars doing their work efficiently al well. That simile is drawn from Honoré, for he spoke of the noisy crowd and pointed out the fine work of quiet men such as Eby and Falls and Gusman and Chamberlain and Edward A. Wilson and Triedler and Charles Locke and Esherick and Thomas Nason, and many others.

But Honoré refused to denounce, as I, thinking of the wild-eyed young man, denounced those who hold that

"Nature Symbolized"—Arthur G. Dove.

they have emancipated themselves from the trammels of authority. He was fair and judicial. "They are experimenters sometimes, not always frauds or fanatics, those who style themselves Dadists and Naturalists and Synchronists and Cubists and Futurists and Vorticists and other ists to designate special pleaders for particular theories. It is possible that out of all that esthetic emotion and what seems like eccentricity something may come that is of value. Good has grown out of other movements which were thought strange in their day. Consider the pre-Raphaelites and how that movement produced Burne-Jones, how it affected the work of William Morris and Walter Crane. It marked a step forward. So also did Cubism. To be sure it was dragged into absurdity by light-headed followers of Picasso, but was at bottom an art of fine perception and out of a kind of ferocious realism grew a subtle quality of line. After all, the artist was trying to see things straight and to set them down as he saw them."

"Improvisation"—Andrew Dasburg.

"The ideal of Bunyan," said I.

"Not only Bunyan but hundreds of others. As for the broad result, any man of common sense should be able to draw a line separating earnest men's work from the work of attitudinizers all full of words and fanciful theories and absurdly exaggerated claims. There are excited young men everywhere, and everywhere there are crafty intriguers full of bombast."

We talked of the claim made by some who held that nothing distinctively American had appeared in art.

"That is nonsense," said Honoré. "I remember that when I was in England, years ago, Walter Crane was writing on what he styled the American New Departure. He was not deploring it by any means. He was rather calling attention to the development of wood engraving and its application to illustration. I pass over the case of Whistler. But to come within the field of art most familiar to the common man, the field of the cartoon. There you have the thing plain. For almost fifty years American cartoonists have done work as distinct from that done by the men on *Punch* and the other English papers, or for the matter of that from the French and German illustrated papers, as was the work of Leslie Ward and Cruikshank different from that of Caran d'Ache or Leandre. If you want examples, think of the clever work of F. B. Opper or Zimmerman or Keppler or Davenport or Dalrymple or Sol Etynge or Frank Bellew or W. J. Linton or Timothy Cole or A. W. Drake."

Presently the talk went back to my youth with those faddist pictures in which there seemed to be neither form nor beauty nor order nor imagination, and the case of Georg Grosz was mentioned. I said that to me the work of Grosz recalled the work of insane artists, or else of those suffering from paralytic dementia, or else the impudent obscenities chalked on walls by silly boys. Honoré knew of the Grosz work and recalled with a laugh that it had been hailed by one critic as "distinctly American, strong and primal."

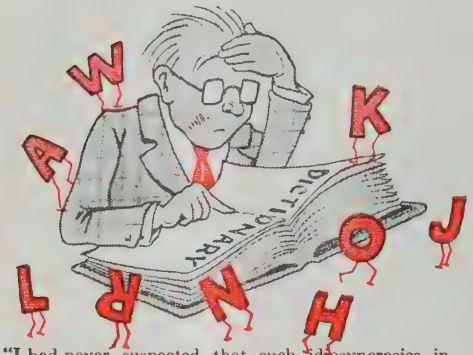
"The excuse made for Grosz," he said, "is that he expresses hatred of evil. That seems to me to be an evidence of loose thinking. Hatred of evil and folly and injustice can be, and has been, expressed without exhibition of bad taste and without falling into the silly or the disgusting. What about Hogarth? Or what about the work of Art Young, or of Gropper, or of Bob Minor?"

By that time Honoré was busy making a charcoal sketch of me. He had broken the conversation off short, saying that he was no (*Concluded on page 27*)

Getting Caught in English Tra

Adventures of an American Who Thought He Knew About Pronunciatio

By BRANDER DE RENNES



"I had never suspected that such idiosyncrasies in pronunciation existed."

I HAD never suspected that such idiosyncrasies in pronunciation existed, and I fell into a good many pitfalls before I got out of the country, and got a good many shocks from first to last.

I had a little business to do along with my pleasure, and an American friend in London gave me a letter to an English business man. I say a "friend"; but he was not at all a friend, else he would have pronounced the Englishman's name for me; but the truth of the matter was that he wanted me to get caught. He'd been caught himself, and he wanted to let another squirm. The Englishman's name was Colclough. I pronounced it as it was spelled when I addressed Mr. Colclough, and he blandly said, "Pronounced Cokely, if you don't mind." Of course I didn't mind in the least; but I was awfully shocked.

Mr. "Cokely" was a good sort in spite of his name, and he gave me several business cards, but without pronouncing the names on them. I took them unsuspectingly, never dreaming that there were any more freaks in pronunciation, and thinking "Cokely" only a coincidence. I found out soon after, however, that it was a habit and not a coincidence.

One of the cards read Messrs. Harenc & Harenc. I pronounced it Harenc, giving every letter its due; but I was up against shock number two when the clerk superciliously pronounced it Haron.

I was beginning to wake up. I looked at the other cards carefully, and they seemed very innocent. One read Hayhurst & Hough, and the other Ralph & St. John. They were dead easy; there could not be anything to twist about them; they had a good American appearance. No pitfalls there! So I sailed in on the first one, and when it came back to me Hurst & Huff, it was a worse shock than the first. Then I got fresh and just low-down American, and said, "What's the matter with the Hay?" and the fellow who attached an R to all his A's said, "I beg your pardon?" And then I remembered that one must not expect a sense of humor to appear in England, and I said blithely, "Oh, nothing, nothing," and he looked a little dazed and amazed, and of course set me down as one more of those crazy Americans.

I was getting timid by this time; so when it came to speaking Ralph & St. John out loud I trembled a little. Of course there was only one possible way to pronounce the two names that I could think of, but still I was not quite sure, so I shirked my duty and just merely asked if "these gentlemen are in." The boy in buttons and no chin said Mr. "Rafe" was out, but Mr. "Sinjin" was in. So I saw Mr. "Sinjin"; but I could hardly speak, I was so dazed.

"The boy in buttons said 'Mr. Sinjin' was in."

After that it got to be a sort of still hunt with me. I ran down every queer name I could find and set it down in a little black book just to show slow-going Americans at home what was doing in the language. It is an incredible list. Some of the twistings are so grotesque that my good Yankee friends won't believe me when I pronounce them. It's like learning English all over again.

I met a lovely woman, who was introduced to me as Mrs. Bewly, and I lost my heart to her; but that's another story. I found out afterward with another terrible shock that she spelled herself Beaulieu. I said, "How can you do such things?" and she never what I meant. But, Bewly or B she was adorable.

I played golf with a fine cha Andrews, and called him Clave —alas!—spelled him Clavers he did the trick as Claverhous

A Mr. Bly turned out according to his card, to be Blythe, and Mr. Cunsbro ca very handsomely on paper as borough.

It seems that the average A knows all about the eccentric such well-known names as C deley and Belvour and Buccleu Mainwaring and Marjoriban Madeline; but I didn't. I pron them as they were spelled a duly astonished when they wer lated for me like this: C Beever, Mannering, Marshban Mawdlin.

I bought some golf clubs of named Klore; but he spelled it

The milliner who made a my mother had a nice sign over her shop tha Bethune; but I knew she herself something else, you fool me, and, sure enoug inquiry I found the tri Beeton.

Gladstone's old home is Hawarden, but pronounced I felt sorry for that; for I think the Grand Old M above such things; but t get the habit in England, i for there's that other gr man, the Earl of Wemy calls himself Weems.

A Mr. Ruthven was in ing party with me. He himself Riven. A little girl face like an angel, and the ma half a dozen angels, told me h was Muriel Sillenger, and I as slyly to spell it for me. It tur to be St. Ledger. "It's a p said right out loud. She said, is?" with her angel eyes upon I answered with a deceptive "That you don't belong to m she never knew how sorry I was

Reconstructors of Europe

GOVERNMENTS change, the pendulum of Europe swings from radicalism to reaction, old statesmen take new posts and coin solutions, and the Old World boils and bubbles along, doing what it can to solve its problems.

And through it all, unsung and unheralded, the New World reconstructors of the Old go their pleasant ways by the tens of thousands, doing good and knowing it not.

They are over there now, and every departing steamship has a full booking. They carry American dollars: dollars that have been marked off the budget already and bear labels such as "pleasure," "education," "culture." To the far corners of Europe they go, scattering along the way the only coin that has never faltered in value this last decade. Peoples who have wrung a pitiful living from a harder world than they ever knew before, but nothing for the simple necessities and never a sou for the cracked teapot or the old sock that should carry insurance for a rainy day, have felt the glow of American gold. American dollars scattered over Europe have done much to start the wheels of trade moving. Even in countries where, since the war, women have gone barefooted beneath the walls of castles now emptied of owners become as poor as the poorest.

No one can measure this flow precisely. It ranks with what the economists call "invisible exports." Europe has exported pleasure, education, culture to the United States; and Europe takes her pay.

But there is one practical measure; a hard, rule of thumb, banker's yardstick. Each day, for months, in London and Paris alone, American travelers have exchanged five millions of dollars for pounds and francs—with no intention of ever taking them home. And this is only a part of the story. Some estimate that Americans spend half a billion dollars a year abroad annually, and have done so since the war ended.

Not large, stacked against the debts of war; but five hundred millions!—a sizable sum when scattered far and wide over Europe, quickening the life of trade.

Some of these travelers will come back to schoolrooms, some will be reading papers before women's clubs this fall, others will plunge into business fresher for a look around; and probably none will know that he has been a "reconstructor of Europe."

Firecrackers

DURING the war Great Britain learned to celebrate the Fourth of July. George Washington, her leaders said, should be honored in England. He was an English gentleman, and he did only what any English gentleman should do—he resisted the bullying of an alien despot.

During the war Britain developed a new conception of empire government; recognizing her colonies publicly as self-governing dominions, and the empire as a society of free nations. Since then she has extended autonomy to Ireland and Egypt.

Excepting, perhaps, the Pilgrim's Society, Britain has now forgotten the Fourth. She shoots off her firecrackers on Guy Fawkes' Day, in memory of a plot that failed.

What a tribute to an idea, and what a warning to misguided despotism, if the firecrackers snapped and the guns saluted in celebration of an Independence Day "on which the sun never sets."

New Buildings for Old

IN A little house on top of a New York skyscraper there is a man with a pipe and a slide rule whose job it is to measure the rate at which we are rebuilding America. In columns of figures that would baffle most of us he has written a strange story these last four or five years.

We were very low a little more than four years ago. Gentlemen who knew the terms of fiscal economics said we were being "deflated." And at the same time a lot of us were homeless, or crowded beyond endurance.

But we must be patient, we were told. It would be foolish to start building things when costs were still high.

Our necessity knew no law, however, and in spite of all the advice in the world those of us who could afford it set about getting for ourselves the new homes we desired. Stagnant industry perked up and again began to take an interest in the things of this world. Orders began to trickle in. Orders for things that go to building houses. Then orders for other things people wanted began to circulate, as the building industry paid wages and the wage dollars moved from hand to hand.

It was an instinct as old as life itself that pulled us out of the doldrums of a near-panic—the instinct of homemaking. New homes

everywhere. A little later, new factories. And, finally, a veritable boom in the construction of buildings of commerce, store and office buildings. In a little more than two years we have spent, without feeling the pull on our purse, as much money in rebuilding our country as that sum owed us abroad which Europe may be able to pay off in a couple of generations.

The man with the pipe has smoked and said nothing, figuring the while. The other day his assistants ran the last card through the very intelligent machine which fills one side of the room, and he manipulated his slide rule for a minute; and out went the announcement that "The volume of new building contracted for in April reached the highest monthly total on record."

The figure for thirty-six eastern states was $546,970,700.

For the country, around six hundred million: twenty million a day, giving us new buildings for old.

Russia Buys More Murders

SUBSCRIBERS to relief funds for Russia will be interested to know that $10,000,000 in Russian gold has been sent to foment revolution in China and the murder of American and British citizens.

American subscribers to famine funds for the "Starving Russians" will be equally interested to know that Russian money is going by the millions to buy wheat flour from Canadian mills.

We are an easy-going people, and we quite naturally follow our instincts as to what is the right thing to do, but we are not entirely dumb. Eventually the facts get through to our consciousness—why not now?

Robert M. LaFollette—1855-1925

MULTITUDES who disagreed with Robert Marion LaFollette's political methods admired his sincerity, and millions who doubted the wisdom of some of his most characteristic proposals accepted the honest loyalty, the superb Americanism and the unwavering spirit of service in the man. He dies a full threescore years and ten, in the month of his birth, and with a record of personal achievement and political influence which will rank high in his generation. When the amount of painstaking labor which he had accomplished is taken into consideration, the marvel is that he avoided a breakdown as long as he did. Those who knew him intimately knew the extremes of his laborious application to the subjects which he had in hand. He had an almost abnormal capacity to absorb knowledge. His passion was for facts. Some of those who estimated him highly felt that the energy which he expended in the search for knowledge had the effect of depleting his inspirational powers, that facts so heavily weighed him down that inspirational wisdom had less than its full chance with him. When one of his sons was ill with an obscure disease and the doctors were nonplussed, Senator LaFollette applied himself to the study of the disease with such masterly skill that, through many days and nights of personal attendance and nursing, he brought the boy through. The deep affection and devotion which existed in the LaFollette family was a most beautiful thing, hardly to be guessed by those who saw the Senator from Wisconsin in the midst of a parliamentary fight.

Senator LaFollette was all his life a poor man. He seldom knew what it was to have an ordinary surplus. When through writing or lecturing he would sometimes make a little extra money, he quickly devoted it to the spread of those ideas which he believed necessary to the people's salvation. Yet it must be owned that though he was prominently before the nation for twenty years, he did not capture the popular imagination to the extent necessary to make him a national character in the candidatorial sense. He was a crusader more than an executive, stronger in the opposition than in the government. His service in the opposition was of great benefit to the nation. The people who could not see the wisdom of his being in the White House were glad of his service in the Senate. And he was not without his triumphs there. When he returned to the Chamber, after the illness which preceded his fatal one, the whole Senate rose to him in a tribute unparalleled in this generation. They were saluting the character of the man.

Wisconsin who knew him best and believed in him most profoundly will feel his loss. He served the State and through the State the Nation in a way that won Wisconsin's love.

The Rising Tide

THE tides of Race consciousness are ruled by laws which have not been charted; we see the effects thereof but we cannot tell whence they come. The world has been awakening to the fact of Race for some time. It is the only irresistible internationalism now functioning among men. Race is an insurmountable, unavoidable human fact. The Chinese evidence it, as do the Jews, the Continental Africans and the Anglo-Saxon-Celtic peoples. The Chinese outbreak is essentially an expression of Race. The point is, not to lose the point in fear or denunciation, but to study the development as we study natural changes in any other sphere.

MR. FORD'S PAGE

THE Fourth of July signifies that you cannot stop a person or a people that knows where it is going. Only he can be stopped who has no purpose, no direction, no destination. The men and women who came to this land, when it was only land and nothing more, knew where they were going. They were headed in the direction of freedom to think, freedom to work, freedom to create conditions of life that satisfied their need.

It is always folly to oppose such a program, because it keeps step with the irresistible law of life. It marches with the sun. And as a matter of fact it is only folly that ever attempts to oppose such movements, folly that goes by the name of Politics. The first planters of the American idea were not opposed by human experience, by philosophy or religion; they were not opposed by their fellowmen of similar degree anywhere; but only by politicians. They were not even opposed by Statesmen, but only by politicians—a distinction which makes the folly more apparent.

The American Revolution was not directed against anything that had gone before; it was a revolt against the refusal to permit pioneers to enjoy what they already had. The American Revolutionary Fathers were British citizens who objected to being deprived of the rights of British citizens. Independence became the indispensable condition under which those rights could be retained and enjoyed.

The old-style written history which serious reconstructors of history have described as "bunk" gave us a false idea of the Revolutionary spirit. The old school textbooks showed us a people imbued with enthusiastic and enterprising support of the principles of liberty. But the documents of the period show us a population that refused to pay the tax that supported the war, desertions on a large and continuous scale from Washington's army, wholesale graft and self-seeking in Congress, and a disposition everywhere to give up the struggle at any time. Only a few spirits kept the war afloat. France supplied the gunpowder, the guns and the cash.

It is always so. The people are always helped forward much against their will. Humanity is not so naturally progressive as we sometimes say it is. It does not move so much as it *is moved* by forces beyond its control. Were it not for leaders, whose self-fulfillment depends on completing the mission they were sent to perform, we little know how slowly humanity would progress.

What are we independent of in America? Of nothing that really matters. We are independent of any foreign government to be sure, but not of government itself, not of the conditions of the world, not of the laws of materials and economics. We have won a certain degree of political liberty, but until we free ourselves from vestiges of corrupt practices, from wastefulness and aversion to work, until we free ourselves of all the things that keep our outlook small and mean, we have not attained liberty or independence.

> *AMERICANS are probably the worst misusers of the term "Patriotism" because so few of them know how much their freedom cost, how it is preserved, how it surpasses what other people have. Waving the American Flag and exploiting the American People is not patriotism. Raising the national anthem and lowering the wages of the workers is not patriotism. It is the most subtle and effective form of treason. Nations are undermined from within by forces that pretend to be patriotic when they are only parasitic. We need economic patriotism, as well as political.*

Patriotism, which is a greatly misused word, serving as a cloak to cover as many knaves as it does fools, is nevertheless a real and basic element in national life. It means love of the people from whom we sprang and of the soil that sustains us, respect for the people's rights and active effort to enlarge their opportunities. Patriotism is only secondarily political. In its pure form it is a family loyalty, a genuine concern for the welfare of our own land, with some to spare for the peace and prosperity of all other lands. That is patriotism. An admixture of other sentiments dilutes it.

No man is a patriot who beats down wages to his workmen or labor performance to his employer. No man is a patriot who erects artificial commercial or industrial combinations that make the people's living harder to get. No man is a patriot who engages in a business the prosperity of which spells injury to any part of the community. He may wave the flag all he pleases and label himself "100 per cent"—if he is exploiting the least of these our fellow-citizens, he is not a patriot.

On the other side, treason to any element of the people's prosperity is treason to the State. The State does not exist on political sentiments or opinions alone, but on the economic security of the citizen. Political patriotism never makes up for economic treason. It is not the alien enemies of our government that we should fear, but those loud "patriots" who regard the people and the country as sheep to be sheared.

Test patriotism by this, and the Fourth of July might become the anniversary of freedom indeed.

The Signers—56 of '76

Our Declaration of Independence Had a Slow and Natural Development

By CARL SCHURZ LOWDEN

THE first American declaration of independence was made by the provincial assembly of Massachusetts in June, 1764, after the premier of Great Britain announced his intention of asking Parliament to levy a duty on stamps. The word, "independence," does not appear in the resolution, but it certainly breathes the spirit of independence and clearly defines the attitude of the colony toward the proposed unjust measure; so although not literally a declaration of independence, it should be considered as practically such and certainly a vital preliminary to the document patriotically born more than twelve years afterward.

"It is resolved," the Massachusetts men agreed, "that the sole right of giving and granting the money of the people of this province is vested in them, or their representatives; that the imposition of duties and taxes by the Parliament of Great Britain upon a people not represented in the House of Commons is absolutely irreconcilable with their rights; that no man can justly take the property of another without his consent, upon which original principles the power of making laws for levying taxes, one of the main pillars of the British constitution, is evidently founded."

Many of the colonies prepared petitions and forwarded them to their agents in England; however, the Parliament refused even to receive these pleas. Such action did not bind Great Britain and the American colonies any closer together. The passage of the stamp tax bill in March, 1765, continued the alienation of American affections.

The Virginia assembly happened to be the first colonial legislature to meet after the news was received. Patrick Henry introduced protesting resolutions which were adopted and which constituted a third near-declaration.

Patrick Henry waxed highly eloquent in proposing his resolutions. He fully believed that the king had acted the part of a tyrant.

"Caesar had his Brutus," he blazed forth, "Charles the First his Cromwell, and George the Third—"

"Treason! Treason!" interrupted the presiding officer and many of the members.

Halliday Historic Photograph Co.

Reading the Declaration of Independence from the balcony of Faneuil Hall, Boston.

"And George the Third," the speaker repeated in a calmer tone, "may profit by their example. If this be treason, make the most of it."

This should be counted as the fourth preliminary declaration. It vitalized the entire House of Burgesses, and next it inspired the people of Virginia from which it then radiated and inspired the whole country.

America maintained a stubborn resentment toward the Stamp Act. Effigies ridiculing it and the enforcement officers were displayed. Business became stagnant. Even marriages decreased in number because stamps were required on the licenses. This state of affairs coupled with a memorable speech made in Parliament by William Pitt resulted in the repeal of the act in February, 1766. The rep carried a joker, however, insisting the right to make laws to bind colonies in all cases whatsoever.

The colonies, believing that t had gained a real victory, were ha for a time, even quite jubilant. T a change of the administration in summer of the same year and sickness of Mr. Pitt, America's c champion, the next y gave the desired op tunity to Grenville, ex-minister, to del a vengeful blow. pushed through a providing for a colo tax upon glass, pa white and red l painters' colors and Concurrently the Bri passed two other m dling acts, one establ ing a new board customhouse officers America and the sec restraining the New Y legislature from funct ing until it should fur the king's troops certain required arti

General indigna ensued. The dist ances in Boston were as to cause the Bri to station troops th The soldiers irritated people, and the pe irritated the soldiers. Finally, in Ma 1770, there occurred a street figh which eleven citizens were killed wounded. This was the "Bo Massacre." America never forgot bloodstains that crimsoned the s of old King street on March f

Boston was memorably heard f again three years later. Britain withdrawn all the taxes except one of a few cents a pound upon in a futile effort to maintain its r to tax the colonies. Three shiploa tea were sent to Boston. The pe wanted the tea, as it was priced vitingly low and was of good qua but they would not buy the tea thus tacitly give their consent to British alleged right of taxation.

At midnight, the citizens disgu

mselves as Mohawk Indians and
nped the chests of tea into the
bor. This sudden onslaught has
nd a place in history as the "Boston
a Party."

The towns of the provinces
d meetings to protest against
British oppression. Boston
k the lead. That city's com-
tee appealed to the whole
Massachusetts for unani-
us action.

"We have abundant reason
apprehend," this seventh
-declaration set forth, "that
lan of despotism has been
certed and is hastening to
ompletion. The late meas-
s of the administration
re a direct tendency to de-
ve us of everything valuable
men, as Christians and as
jects entitled to the rights
native Britons . . . We are
afraid of poverty, but we
dain slavery. Let us con-
er that we are struggling for
best birthrights and for our
eritance which, being in-
ged, renders all of our bless-
s precarious in their enjoy-
nt and trifling in their
ue."

On the twelfth day of
rch, 1773, the House of
rgesses in Virginia named
tanding committee of corre-
ndence and inquiry to keep in
ch with her sister colonies and thus
enabled to act as a unit instead of
arately.

The second Continental Congress
vened on the fifth day of September,
'4, in Philadelphia. With the lone
eption of Georgia all the colonies
l delegates there. It speedily pro-
ded to commend the action of
ston and the province of Massa-
setts. Next it published a declara-
n of rights in ten numbered para-
phs which concluded as follows:

"All and each of which the aforesaid
uties, in behalf of themselves and
ir constituents, do claim, demand
l insist on as their indubitable rights
l liberties which cannot be legally
en from them, altered or abridged by
r power whatever without their con-
t by their representatives in their
eral provincial legislatures."

The provincial assembly of Massa-
setts announced its intention of
eting in Boston on the fifteenth of
ober. General Gage, commanding
British troops there, forbade the
sion. They evaded him, however,
going to Concord where they
ted John Hancock as their president.
ey shifted again so that on the
enteenth they were in Cambridge.

There they proceeded to put the province in a state of defense; they appointed a committee of safety and a committee of supplies. One-fourth the militia was ordered frequently drilled and held in readiness to serve at a minute's warning; they were appropriately called "minutemen." It was these men who, on April 19, 1775, resisted the British troops dispatched to Concord to destroy the military stores that the colonists had collected; there our forefathers fired the shot which seemed "heard around the world."

"The Shrine" in the Library of Congress in which the original Declaration of Independence is kept.

The Massachusetts legislature authorized the borrowing of one hundred thousand pounds, and an army of thirteen thousand men. It also released the citizens from obedience to General Gage. This, being a separation from Great Britain, was just one more pre-declaration.

Congress still held out the olive branch though the war was really on. While preparing for defense, a majority of the members insisted upon another attempt at reconciliation. This was made. The petition recounted various misdeeds of the king's administration, then asked:

"Can the descendants of Britain tamely submit to this? No, we never will. While we revere the memory of our gallant and virtuous ancestors, we never can surrender those glorious privileges for which they fought, bled and conquered. Admit that your fleets and armies can destroy our towns and ravage our coasts: these are inconsiderable objects, things of no moment, to men whose bosoms glow with the ardor of liberty. We can retire beyond the reach of your navy and, without any sensible diminution of the necessaries of life, enjoy a luxury which you will want—that of being free."

Congress reminded the king that the loss of liberty in America would only be a prelude to its loss in Great Britain.

On June 15, 1775, Washington was selected as commander-in-chief of the Army then being raised for the defense of American liberty.

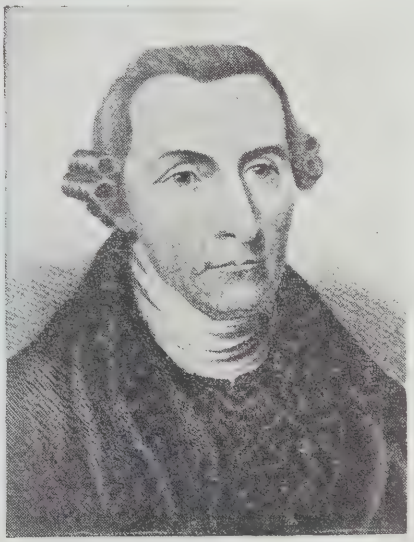
During the autumn, winter, and spring, Thomas Paine extensively circulated his pamphlet, "Common Sense," which urged independence from Britain. The host of converts increased; by next June many persons were clamoring for independence.

Consequently on June 7, 1776, Richard Henry Lee, of Virginia, introduced his famous resolution "that these united colonies are, and of right ought to be, free and independent states."

The next day Congress named itself a committee of the whole to consider the proposal. Two days later Benjamin Harrison, chairman of the committee, requested that the matter be laid over for the consideration of a full Congress on July 1, also that a special committee be appointed to write a declaration breaking the alliance with Great Britain.

Accordingly, a committee of five men was named on the following day. Thomas Jefferson, of Virginia, headed the group as chairman. The other members were: John Adams, of Massachusetts; Benjamin Franklin, of Pennsylvania; Roger Sherman, of Connecticut, and Robert R. Livingston, of New York.

Pennsylvania indicated its willingness to concur in the matter of independence. Shortly afterward the delegates from New Jersey announced that



Patrick Henry, of Virginia, was probably the chief agitator for separation from Great Britain.

they had been directed to do likewise.

Precisely as planned for July's opening day, Benjamin Harrison read the draft of the declaration. Then he offered the resolution "that this Congress will, tomorrow, take into consideration the Declaration respecting Independence."

In the ensuing debate the charge of treason was made against John J. Zubly, a German member of the Georgia delegation. Congress expelled him. Next the formal document was corrected by Congress. Then the debate on the revised draft served as a prelude to the memorable action of July 4, when the entire Congress, with the exception of three Pennsylvania members, formally adopted the immortal paper. Here and at this time our holiday, the Fourth of July, originated.

DOLLY MADISON

John Hancock, the president of Congress, signed his name in bold characters. He explained that he hoped to save the British king the trouble of using spectacles in deciphering his signature.

The old bell-ringer of the building rang the bell, throughout a period of two hours, so energetically that it probably cracked then with the joyous peal, though the injury was not discovered at that time.

Congress had convened in Philadelphia and had promulgated the Declaration of Independence there. But New York was fervently stirred too; as soon as the people received the news they pulled down a gilded lead statue of George the Third and changed it into bullets. At Boston the Declaration was publicly read from the balcony of Faneuil Hall, the "Cradle of American Liberty."

On July 19, an engrossed copy of the Declaration to contain the signatures of all the delegates was ordered by Congress. Two weeks later the copy had been prepared. Fifty delegates indorsed it at that time, and six afterward.

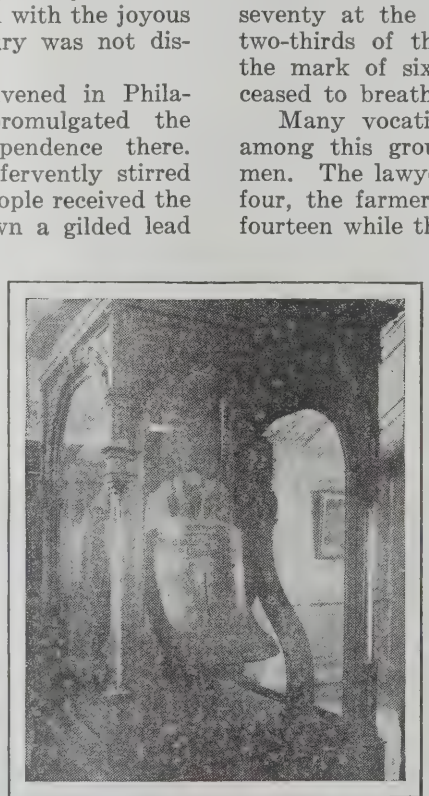
There was both solemnity and jocularity on the second day of August when the delegates, by placing their names to the document, gave birth to a new nation. The various incidents accompanying the act, however, will be told not here but in succeeding articles.

"Thomas Jefferson was wont to relate when in a reminiscent mood," one historian has recorded, "that the signing of the Declaration of Independence was hastened by swarms of flies that came into the hall through the open windows of a livery stable nearby and assailed the silk-stockinged legs of the honorable members. Handkerchiefs in hand, they lashed the flies with what vigor they could command on a hot August afternoon. But, despite their efforts, the annoyance became at length almost intolerable, and the members made haste to bring the momentous business to a close."

The youngest signer was Edward Rutledge, of South Carolina. His twenty-seven years contrasted strongly with the threescore and ten on the shoulders of the oldest signer, Benjamin Franklin, of Pennsylvania.

The longevity of the signers was really remarkable. Three lived beyond the age of ninety, ten exceeded eighty, eleven reached seventy, and fourteen were between the ages of sixty and seventy at the time of their deaths: two-thirds of these patriots attained the mark of sixty years before they ceased to breathe.

Many vocations were represented among this group of fifty-six sturdy men. The lawyers numbered twenty-four, the farmers ranked second with fourteen while the merchants took the third position with their total of nine. One was a minister; three were hoping to occupy pulpits later. Four were physicians; one of the fifty-six was a manufacturer.



The Liberty Bell in its glass case.

During the War of 1812, we nearly lost possession of our treasured birth certificate. A woman saved it. The enemy swarmed into Washington, and when the danger of capture became imminent, Dolly Madison, who had lingered at the White House, fled, taking with her the official Declaration of Independence. In 1894 the tattered but cherished paper was hermetically sealed and placed in the care of the Department of State. It is rarely shown now.

Is It True W Are Untruthful

(*Concluded from page 3*)

Because some folk wear and displ dirty linen is no manner of reas for believing that most are cloth in the same unpleasing fashio Surely that much of the truth visible. But the newspapers dor say so; and gossip-mongers do like to state it. One swallow does n make a summer. No more does o blackguard or blackguardess ma society a dirty entrance hall to Had Mr. Justice McCardie, who tried t case, expressed himself clearly a definitely: "Cases like the present not in any way represent the gene life of well-to-do people in Engla They give a wholly false impression English social and family life." Tha truth. A whole and wholesome tru Yet there are thousands who do grasp it. Because a few—a vast min ity—individuals are very nasty it concluded that the many are a beastly. That's not a truth. In ev country there are certain old and you folk, males and females, who beastly. It has always been so; probab will always be so. But if a whole tion went rotten, or the whole of a class in any nation went rotten, it wo go and step out of business. Tha that. That's truth.

It was my fortune, good or b some years since to be on the ins of English society—with a big S to mingle with the mighty. I quit because it bored me; I found it d There are three classes in Engl society: (a) The clever few, who ma names for themselves despite th rank and titles; (b) The vast majori who are uninteresting, conservati good, hard-working; (c) The minute nority who "go to the deuce and make excuse and never come back no mor It would be as idiotic to judge soci by class (a) as by class (c).

The truth, the whole truth, is t men and women are much of a mu ness in all countries and in all ran A sprinkling is uncommonly good uncommonly bad; the huge majo is just about like you and me. That's whole truth. Get at the facts yourselves and you'll agree with At any rate I hope so.

Perhaps one of the most comm crimes is perjury. This crime a rule is not committed in the byw of civilization where the moral se of the people is supposed to be at lowest ebb, but in the courts of l of highly civilized countries, ri under the noses of the judges. To "the truth, the whole truth, a nothing but the truth" seems alm impossible with a large proportion witnesses. This is perhaps one of worst forms of indifferentism. Peo may not lie deliberately, but they the truth carelessly.

The Slav—Old, Yet Full of Youth

A Paradoxical People Whose Fluid Nature Is Apt to Overflow

By ALBERT ERNEST JENKS
Professor of Anthropology, University of Minnesota.
Copyright, 1924, by A. E. Jenks.

THE tenacity of the many Slavic characteristics which have persisted throughout the widespread geographic distribution of that people show that in their original area their progenitors developed not only a distinctive language but a distinctive temperament and culture pattern. I shall present some of the outstanding Slav characteristics with especial attention to those which have world significance.

Though the Slav is old, he has the elasticity of youth. He seems to have been on and retained the fluidity of the slow-flowing waters of his original home nest. As history shows, the Slav has flowed into the various molds which nature or man has provided, whether geographic or political. A marvelous flexibility of temperament and intellect has given him a suppleness of mind and the faculty of imitativeness and adjustment almost incomprehensible to other races.

From this fluidity comes the extremism of the Slav. Though he runs readily into any mold, he does not hold shape. He is prone to flow beyond the bounds to any and all extremes. President Masaryk, in his volume, "The Spirit of Russia," says this extremism is due to the fact that the Slav, in looking to the East rather than to the West for his cultural stimuli, never took on the spirit of Roman formalism leading to compromise. Hence the conflicts of ideas and ideals in Slavic life end in exhaustion, rather than in compromise.

Slav extremism explains much that is contradictory in their character. Balzac speaks of the fluid nature peculiar to the Slav . . . which gives them an amazing inconsequency of conduct," and tells the story of the Countess Caraboosse who, at the christening of old Gerard, overlooked by the fairy who endowed that attractive people with the most brilliant gifts, came forward to say, "Keep all the gifts that my sisters have showered on you; but you will never know what you wish for." We find in the Slav the most extreme orthodoxy, and liberalism to the point of nihilism. We find the depth of understanding compassion, and the fiercest cruelty. We find one day the death penalty abolished because of its inhumanity—the next day restored because "we must kill with all our souls."

This extremism has enabled the Slav by his genuineness to make great world contributions to literature and art. He has depicted, without shadow of compromise or reserve, to an extreme from which other writers shrank, life in its most vivid reality. The Slav writers have not only laid bare their own souls, but they have shown us the soul of humanity. All modern realistic literature has taken its pattern from their masterpieces.

This genuineness and feeling for reality makes the Slav a great "actor." His suppleness of mind and his ability to follow thoughts and emotions to the farthest extremes make him for the moment the person he represents.

In the political life of the Slavs, especially those groups less mixed with alien blood, their fluidity and extremism have produced an anarchical spirit fatal to political stability and ordered progress. The Slavs have not been constructive political leaders. They have never governed themselves as an advancing people. It may almost be said of all Slav groups, as has been said of the Russian peasants—"they have always been led around by the nose by some one."

Nestor, the first chronicler of Russian history, tells us that the Russian nation had her beginning in the year 862 when the tribes of Novgorod invited Scandinavians to their land to rule over them. Whether the story is literally true, the cause of the invitation, as given by Nestor, is an unquestionable picture of Slavic instability. Of these tribes he says: "Among them was not a shadow of justice, family rose against family, and this disagreement occasioned frequent conflicts. They were torn among themselves to the point that at last they said, "Let us seek a Prince who will govern us and speak to us according to justice." Since that time the predominating blood of Russian rulers, nobles and leaders has been Swedish, Tartar, German, or Jewish. The name of the last ruling family, with Czar Nicholas as its head, was Romanov-Holstein-Gottorp. The founder of that family was a Teutonic immigrant from Prussia. The Bohemians, perhaps the most stable Slavs, reached their zenith of culture under Teutonic leaders. The Jagiellonic dynasty which made old Poland great was of Lithuanian origin. The various branches of the southern Slavs had short periods of comparatively stable power, probably under leaders with foreign blood, in the Middle Ages. With the one exception of Montenegro they were all later under the Turk for 400 years. Little Montenegro in her country of soil-less mountain rocks fought a winning fight against the Turk. But she made no pretense to advanced culture. Her limitations were patent. Servian history during the hundred years of her freedom from the Turk was the terrible record of the revolutions and cold-blooded murders of an undisciplined people. The new Slavic governments were all set up under external influences.

"Torn among themselves"—this phrase alone is Slavic history. The historians of the Middle Ages tell us that there are few medieval subjects more confusing than the distribution and nomenclature of Slavic peoples on account of "the incessant combinations and dissolutions of national groups." Their inherent inability to make firm combinations, the ease with which they may be pitted against each other by foreign foe, has ever been their political undoing. It was the cause of the defeat of the early Baltic Slav in his long conflict with the Teuton. It has been for centuries the cause of the troubles of the Balkan States in which all Europe was finally involved.

The blind gusla player. Market place in Cetinje, Montenegro. His melancholy narrative song is reflected in the faces of his auditors.

They are well aware of this defect in their character.

" 'Tis but Slavonic kin among themselves contending,
An ancient household strife, oft judged but still unending,"

Bringing Up the Family on a Sense of Humor

Is Ridicule More Painful Than Downright Wickedness?

Are Wi... More Humorc... Than Their Husban...

A baggage room—the only place in the world where two persons can be alone.

By THOMAS L. MASSON
ILLUSTRATED BY W. O. FITZGERALD

THE somewhat intimate revelations that follow in this article are not intended as a species of self-exploitation, but are presented only because they reveal certain useful principles for the upbringing of families, as the outgrowth of actual experience. What I mean primarily is that you can be as personal as you like in an impersonal manner, if the thing is done so that the application is universal. I should also add that my own system of humor in families is by no means perfect. Occasionally it has backed me into a corner from which no retreat is possible. When you bring up a lot of people from their cradles to discriminate, even on the shortest notice, among nice shades of humor, the results are not invariably satisfactory, and one may have to do a lot of explaining; as for instance when one of my married girls, who had come into possession of a 7¾-pound boy, asked me if I did not think he was the most beautiful baby in the world, and I replied: "Certainly my dear, but you must admit that he has taken enormous pains to conceal it." This not too robust jest is really presented as one of the things generally to be avoided, because it belongs in the group of satirical sayings which only sting, and seldom do any good. Indeed, I have in mind several acquaintances who have developed this sort of thing (vulgarly known as "the dirty dig") so that they have come to be shunned by everyone—indeed, have developed into a kind of outcasts. In the present instance, however, I was simply trying to convey the wholesome truth that, no matter how beautiful your own possessions may seem, it is just as well to screen your sense of proud ownership from a heartless public.

Humor of any sort is much like dynamite. It depends not only upon the application, the quantity and the persons involved, but upon the environment as well. And by environment I mean the atmosphere of understanding. Many estimable persons would no doubt have been peculiarly horrified at a conversation I once held with that inimitable wit Oliver Herford upon the best manner of preparing a baby for the table, and which extended into many intricate gastronomical details, and which was finally concluded by his remarking, with gentle gusto:

"After all, I prefer my babies boiled, with brown gravy."

But allowing for these risks and other possibilities for trouble caused by humor *de trop*, which will no doubt be evident to intelligent friends, I must say that in my own case and in my own family the results of humor have been wonderful; and much of it I must hereby acknowledge has been far below grade. In its right aspects, humor is nothing but a form of truth which acts as a searchlight upon indiscretions. A little humor, applied at the r... moment to that hideous mass of c... bined ignorance known as a fa... quarrel, will almost invariably b... it up. I suppose that nothing on e... is more effective in calling up the r... depraved qualities in human natu... greed, envy and even murder—... a division of property in fam... w be confronted by a similar situa-
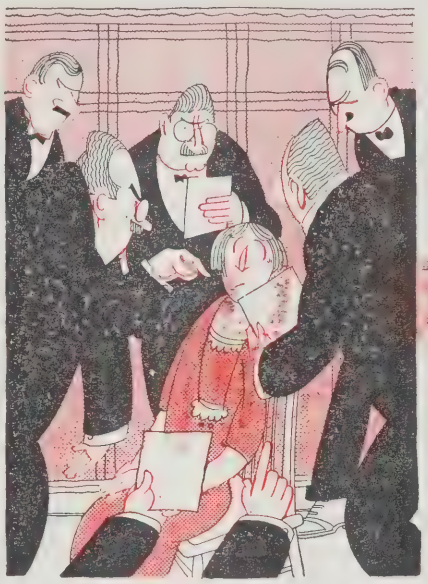
n to which I have only briefly re-
red, will get the thought that all
is outward joking was actually a
nd of antiseptic, that it served its
rpose to lighten the strain. Also
at by thus making the desire for
ssession incidental to life itself, each
e was, to be strictly accurate, getting
actly what was right. For in the
al adjustment this was the one thing
hich was apparent to all. In the end
stice always comes; and what humor
es is to break up bad feeling—tide
ings over. It is the same kind of
ing, in families that, for example, lies
ck of the League of Nations. War
n always be stopped if it can be
ferred; and any wicked thing can be
ferred by holding it up to ridicule.
here have been a dozen or more times
thin my own recollection when di-
rce would have been quite inevitable,
either my wife or myself had not
ddenly burst into laughter at the
diculous figures we were cutting.
may seem strange to say so, but
mor is nothing but tolerance. I
ok back now upon some of the hor-
ble things I myself have done to my
mily with a much greater horror than
herwise, because, they were treated
the time with the tolerance of
mor. To be ridiculous is much more
inful than to be downright wicked.
hat is the trouble with our criminals.
ey are taken much too seriously.
nding flowers to a murderer in jail
not half so effective as if they were
bbages. If gunmen were regarded
silly clowns instead of heroes, they
uld all die out.

Indeed, the value of the right kind
humor is so great that I am appalled,
I look about me, to see how little
is used or understood. This is true
t only in families but in our public
hools, where humor of the right sort
almost invariably repressed. This
pression is apt to result in a kind of
se humor—outbursts of horseplay,
actical jokes, et cetera—for human
ture always gets out of hand in ab-
rmal ways when not permitted to
w through normal channels. I
member not long ago attending a
blic school affair. One of the per-

formers, who happened to be a girl of great humor and unusual dramatic gifts, began an original and I judged impromptu recitation which was so funny that the whole school burst into loud laughter. This caused the humorless principal to step forward on the platform and say:

"I will not tolerate applause. It must be stopped at once."

I have seen this false spirit of dignity constantly manifested in our public schools. The right discipline, and this of the severest kind, can be maintained much easier by the cultivation of the right kind of humor, than without it. I shall make no attempt here to define the various kinds of humor such as satire, irony, wit, and so on, merely observing that by humor I mean not only cheerfulness, but cheerfulness united with true insight and imagination.



If I ever marry again, I am going to have my wife examined by a board of financial experts, et cetera.

Those who are familiar with the life of Abraham Lincoln will understand what I mean. It was this kind of humor which enabled him to manage his Cabinet—and particularly Secretary Seward—in the way that he did. It was the kind of humor which made him say, upon one occasion when he addressed a company of pretty girls in a girls' seminary, after he had been sitting on the platform for some time facing them:

"Ladies, I have been looking at you and you have been looking at me, and I rather reckon that I have had the best of it."

One day I chanced to be in the Egyptian corridors of the Metropolitan Museum of Art in Central Park, New York. There was a mummy there in a glass case, one of the Egyptian kings. He was lying on his back, face up, his attention focused on the ceiling, and in studying his features and his general air of abstraction, I recalled to mind what Mark Twain said when he saw his first mummy in Egypt:

"If he ever comes to life again, cable me at my expense."

I believe it was this recalled levity of Mark Twain's that put me in a sort of irresponsible mood of reckless cheerfulness, as most of his observations invariably do. At any rate, there was a young woman there of about twenty (if it is possible in this or any other age to pass accurately upon the personal chronology of a woman) and looking rather like a student, who, through her tortoise shells began asking me some timid questions about that particular mummy. She evidently thought from my own solemn air and my ubiquitous atmosphere of unintelligence that I was some sort of a college professor. I answered her as best I could, telling her briefly all I knew of Thotmes and Rameses and King Tut, and the method devised for perpetuating their visible remains. Then I added, referring to the distinguished royal gentleman who was so quietly reposing in the glass case: "As for our friend here, I can only speak from hearsay, as I did not know him personally."

That nice young girl looked at me in mild surprise and said quite positively: "But how *could* you?"

I hasten to observe that this recorded incident is not intended as any reflection upon the feminine sex, as my experience shows me that women as a whole have in many respects a much keener (although quite different) sense of humor than men. As a matter of justice this same girl almost immediately added with a smile: "Oh, I see what you mean," and we both combined a common sense of cheer over this immature echo of Mark Twain's original remark.

But is it not plain from this, and a matter which anyone can verify, that almost all people you meet are under this spell of their own affairs and thought?—that is to say, all people take themselves too seriously. They are unable to stand apart from themselves and look at themselves as if they were someone else. And this is what genuine humor does. And this genuine humor I am extolling is founded on a unity of Love, Humility and Cheerfulness. It is to face all things as being incidental. And to do so with song. When King Saul was

A little humor applied at the right moment will almost invariably break up a family quarrel.

afflicted with an evil spirit, it is recorded that he sent for David and that,

"David took an harp, and played with his hand: so Saul was refreshed, and was well, and the evil spirit departed from him."

And there was the right spirit of humor expressed in the remark of Leonidas, the Spartan hero, doomed to die at Thermopylae, who is reported to have said:

"Let us dine cheerfully brethren (comrades) for tonight we sup with Plato."

Shakespeare's Polonius Was a Bore

This is the attitude of one who is able to look forward out of a present situation, however desperate and tragic it may be, into another situation more closely allied with permanent values. As for humility, which I have counted as one of the attributes of the kind of humor I am writing about, this is somewhat allied to the inferiority complex, which recently the more exalted psychologists have declared is the background of all great humorists.

The idea is that, if you feel perfectly awful about yourself—that you are no good, et cetera—you anticipate others by admitting it. You laugh at yourself, thus keeping others from laughing at you. Thus you get the best of them, for you have nothing to lose. Socrates assumed that he knew little or nothing. Mark Twain's attitude was not dissimilar. Whatever may be said about all the lights and shades of this attitude—and I am sure my readers will overlook my not boring them further with these psychological digressions—it is certainly the reverse of that expressed by another young woman who sat back of me at a performance of "Hamlet" by Walter Hampden. As those familiar with Shakespeare's masterpiece know, the character of Polonius is a bore intended as such, and I have always thought Shakespeare purposely had him killed off first in the play to emphasize the correct treatment of all bores. The actor who took the part purposely made it more convincing—his Polonius was obviously the bromide. The young woman back of me, after Polonius had made his exit in the first act, suddenly turned to her companion and said in a loud whisper:

"He doesn't know his part; he keeps repeating himself."

Cocksure Attitude of All Crude Minds

This is the cocksure attitude of all primitive and unseasoned minds, minds not naturally imaginative, or else untrained outside of themselves. This girl would have been deeply mortified if she had been told the truth. Literal minds like this should not however be criticized too sharply. The fact is that they constitute a large part of the world's stability—assuming, of course, that the world has any stability. "It is the average stupidity of all Englishmen," someone has said, "that has enabled them to muddle through everything." In any classroom, it can easily be seen that those modern unimprovements known as "funny cracks" must be sternly avoided. It is precisely this confusion as to what real humor is, which causes all the trouble. Because humor is an enormous aid toward accurate thinking is why it needs to be cultivated. The literal attitude is too apt to be inaccurate, as it takes into consideration nothing but itself, nothing but what it can see. What it has done for me and my family—on the basis that, being mostly over, "now it can be told"—may be shown only by the recital of actual occurrences. That women have, as I have hinted, a keen though different sense of humor from men, and that my wife is not lacking in this respect, is indicated when she did not take it amiss when I wound up my proposal in the baggage room of the New Haven Railroad. Indeed, I have always thought that her somewhat reluctant acceptance was due to her respect for my extraordinary intelligence in selecting such an ideal place. I had to live down this reputation for intelligence later on, because my effort to live up to it did not always make the grade. Indeed, having begun on the train, a sudden inspiration made me wind up in the baggage room, a spot I recommend to all lovers—the only place in the world where two people can be alone. Anyone who doubts this has only to stand there for a moment inhaling the concentration of travelers waiting to get their baggage checked.

About Writing Jokes for a Living

The next event of any cheerful importance was this—that, having become more or less comfortably married—for in the beginning our habitation was painfully cramping—I had to force my production of ephemeral humor (I abased myself by writing jokes for a living) to take care of increasing expense. After our first child was born my attention was thus called to the more (outwardly) cheerful aspects of the production of human beings, and my imagination being thus extended, I wrote a series of jokes about triplets, from the proceeds of which I was able to pay my first doctor's bill. Little did I realize at the time what would happen from this humor-forcing process, for my mind being thus concentrated upon triplets on paper, the colossal fact was that we almost immediately had twins. This shows the cumulating effect of humor. Having been cheerfully assisting at the imaginary births of unnumbered triplets: result twins in my own limited home. Had I carried my fancies more numerically further, and had written jokes about quartets, I have no doubt we should have had triplets. As a rule what you think—even humorously—is about one lap ahead of the actual. Meanwhile our doctor's price had risen. He was in the same boat with us. Where I had been smart enough to raise the price of jokes from two to three dollars, he argued that he had to have more for babies. Even at that his price of one hundred dollars (that was a long time ago when the cost of being born was fractionally less than at present) seemed high, but our protests were in vain. After the affair was over, I recall quite vividly that the very first thing my wife said, when informed that there were two, was:

When Lincoln Had His Little Joke

"Well, honey, we got even with the doctor, anyway." Yet they tell us that women have no sense of humor.

This, of course, is merely a slight (from the masculine standpoint) illustration of the power of humor in lightening up periods of one's life, either short or long, which carry with them the elements of pain or tragedy. But the power of ridicule, when it is used judiciously and based on right principles, is amazing in its balancing effect. Thus Abraham Lincoln knew how to use it in his treatment of Clement L. Vallandigham, in 1863. This disturbing spirit, it will be recalled, was disloyal to the Union, and was finally arrested for making speeches against enlistment. Whether his arrest was legal or not is a question still discussed by historians. He might easily have been shot or hanged and thus, owing to the temper of the time, have created sympathy which in turn would have hurt the cause of the Union, when the Union needed every friend. Lincoln, sensing the danger, sentenced Vallandigham to be conducted over the Southern boundary, to be hereinafter confined within Southern lines. The absurdity of this sentence made the whole affair ridiculous and it came to be regarded (as Rhodes the historian states) "as a huge joke."

It is the widespread absence of this abiding sense of ridicule at the present time which makes crime and divorce so prevalent. To advert for a moment to a later period in my own life and family history—for this is not intended as a dull chronological record—one of my own boys ran off and got married without permission or prospect. In the course of my life I have known a number of fathers and mothers who have been confronted by a seeming misfortune like this and who have handled the affair so badly that many lives have been ruined and in some cases whole families have been broken up. Two instances occur to me. A wealthy widower had two daughters. One of these girls was courted by a young man who at the time had no resources, but he was respectable and was getting on. There was no other objection. The old man, a good deal

Humor as a Clearer of the Air

(Concluded on page 2

The Slav—Old, Yet Full of Youth

(*Concluded from page 15*)

e first Balkan war, the Slavic papers id frankly, "We have beaten the urks; now do not let us quarrel among rselves." But the warning was in in, as the second Balkan war showed. This age-long political disability is e first of the three Slavic characteristics with which the world must ckon. That so large a part of the pulation of the civilized world should unable to keep its own house in der and should be ever an easy prey foreign minority rule stands as a esent and future menace to the peace the world.

We turn to another aspect of Slav aracter. Subdued emotions have ways been characteristic of the Slav. s we have seen, they were early fosred in the gloomy forest-swamp abitat. They were later conserved by e monotony of the vast forests, ains and steppes of Russia. They ere fostered by the hard and rude e of the early Slav in his contact ith an inexorable environment. They ve ever since been fostered by the verty of the peasant compelling a ode of life not greatly different from ehistoric and early times. "Every ussian village is much like another," id a newspaper correspondent in 1916. A market place and one-story houses ing a narrow unpaved slough called street. Lying between these breeding aces of typhus and cholera are long etches of dark forest, squashy fields d roads that lose themselves in inundated tracts.

Homes Where Squalor Prevails

Toward evening the loneliness and monotony of the scene creates crushing effect of gloom."

An immigrant from Russia, a sident in America, writes: "Let me sure you that, no matter what kind phantom of poverty you may build, will never approach the poverty-icken dirt and squalor in which y countrymen live. Their huts are nstructed by placing one upon the ther trunks of trees each grooved so a to fit over the one below. Between te crevices are stuffed masses of moss. he roof is formed of planks on which i laid a thatch. All the hovels are tting their light during the day rough a little pane the size of a ot square, and are illumined at night a candle or by a little kerosene mp. Most of the huts are without imneys, and of one compartment. he entrance to the hut is so low that is necessary for one to bend to enter. hen you are inside you wish you were ot, for you will find yourself in darkss and slush, as not one of these huts as a modern floor. And the atmosphere in these huts! The mere thought o it makes me shudder and gasp in horror." Said a Ukrainian in America, a priest, "We Russians likes our and bitter foods—just like our life in Russia."

Subdued emotions have also been conserved by the almost universal oppression of their alien and autocratic rulers. "A long black night, the year," says the Bulgarian under Turkish rule, speaking for the entire race as it has bowed in enforced submission to the oppressor.

The Philosophy Which Whispers "Nichivo"

From his life of melancholy hardships has come the fatalistic attitude which is a part of Slav nature. "The Russian soldier is to me the most philosophic individual in the world. I have seen him in the hospital with arms and legs gone, head mashed in and ghastly wounds of all sorts. And, if he has the strength to speak at all, he whispers 'nichivo'—the equivalent of which in English is 'what difference does it make, anyway'"—said Stanley Washburn during the World War.

A dogged submission to inevitable fate is the theme of Slavic literature, music, and art. "But what am I? Of whom, to whom, am I complaining? 'Tis plain, God willed it so. If I am to be lost, then so be it," says one of Gogol's characters. One feels the hand of fate at his very heart as he lives with the characters in a Russian novel. It is impossible to stand detached and view them from afar. Whether it be Tolstoy's "Anna Karenina" or Dostoievski's "Sonya," that most tragic figure of fiction, or Turgeniev's dumb "Mu-mu," the certainty of their impending doom is always present. Joseph Conrad, the Slav, though he wrote in English, has given us a true Slavic fate story in his masterly "Lord Jim."

As to Slavic music one can never forget the wail of the one-stringed gusla under the hand of the blind player in the market place of a Slav village, any more than one can shake off the spell of the fate *motif* of a Tschaïkovsky symphony. Of this theme in his "Fourth Symphony," Tschaïkovsky, greatest of Russian composers, said: "The opening theme represents fate, the power that thwarts our aspirations toward happiness, that jealously watches lest happiness should get the upper hand—a power which, like the sword of Damocles, continuously hangs over our heads, a power that perpetually poisons the soul. It is overwhelming, invincible. Nothing remains but to resign ourselves to it and to lament in vain."

The Slav sculptor, Ioukoff, has again immortalized the theme by his art. His masterpiece, "On the Edge of the Abyss," is a terrible production of creatures in agony suffering under the hand of the same relentless fate.

From the melancholy fatalism of the Slav has come another of his strongest characteristics, that of patient endurance. The early Slav in his forest swamps endured. Enemies of whatever nature finally gave way before his patient endurance. He was thus prepared as he spread out from the home nest to bow alike before the tyranny of geographic environment and political rule, but always to survive.

The Slav bends but he does not break. He has passive courage which seems to manifest itself in procrastination, almost in inertia. But it also manifests itself in endurance. In unbounded patience the Slav is hardly excelled by any people of the earth.

This fact of endurance is the second great characteristic which the world must reckon with in any consideration of the Slav, either for the present or the future. In spite of his disorderly house, in spite of the bitterest oppression of alien masters, the Slav survives. He has an almost uncanny staying power. He has an almost magical recuperative power. Through all political vicissitudes he still remains a world force of tremendous potentiality.

The Power of Russian Literature

Out of the melancholy and fatalistic attitude toward life comes also Slavic compassion. The first result of a great sorrow is a new sympathy for others in sorrow—a new understanding of all sorrow.

The power of the Russian novel lies not alone in its depiction of the reality of suffering but in its revelation of a compassionate understanding of humanity. This understanding and compassion extends especially to those in the lowest depths of life. It passes the pale of his own group to include those who suffer in every caste and race. It comes to be an almost universal sympathy, an almost idealistic humanitarianism. With this humanitarianism, and a mystical religious sense which he has always possessed, the Slav in his best moments has seemed to feel within himself the possibilities of a great spiritual development. Slavic writers have recognized that spiritual growth and power are not the product of material prosperity, but of suffering. Dostoievski and Tolstoy alike preach redemption through suffering. Of Dostoievski's "Crime and Punishment" Stevenson said, "Henry James could not finish it. All I can say is, it nearly finished me . . . Many find it dull . . . to others it is a room, a house of life, into which they themselves enter and are tortured and purified."

As to America, we shall profit by the rich heritages our 10,000,000 Slavic fellow citizens bring, while we guard against being weakened by those of their age-long characteristics which are alien to American institutions.

Lost Page of American Revolution

The Story of Nathan Hale's Heroic Sacrifice; What a British Soldier's Notebook Disclosed

By H. T. COOK

"I ONLY regret that I have but one life to lose for my country." These immortal words that Nathan Hale, the young New London school-teacher, uttered, as he stood upon the scaffold with a noose around his neck, still stir patriotic emotion, even though the event happened almost a century and a half ago.

Historians tell us that the young patriot was buried near the spot where he was executed. The site was unmarked, but it is supposed to have been under an apple tree which grew where a statue of him now stands in City Hall Park, New York City. This bronze representation of the young captain with his arms bound is one of the most pathetic figures ever wrought by a sculptor.

While it has been generally accepted that Hale was executed in City Hall Park, no official record can be found to establish this fact. There has been found, however, recently, in a second-hand bookshop in London, a memorandum book, which evidently belonged to some British soldier during the Revolution, which has clarified the mystery somewhat. The relic is of great historic value and is now in the possession of the New York Historical Society.

One of the entries reads:

"Sept. 22, 1776; A Spy from the Enemy (by his own full confession) Apprehended Last night, was this day Executed at 11 o'clock in front of the Artilery Park."

City Hall Park during the Revolution was called Artillery Park.

The story of Hale's heroic death, and the memorable words he uttered when he was standing on the fatal ladder, will ever remain an inspiration to American hearts.

A Spy for the Enemy (by his own full
Confession) Apprehended Last night, was
this day Executed at 11 o'Clock in front
of the Artillery Park
Memorandum

Page from memorandum book of British soldier, found in London bookshop.

Hale was only twenty-one years old when he died. He was born in Coventry, Connecticut, June 6, 1755, and was the sixth child of a family of twelve. He entered Yale College in 1770 and was graduated with the highest honors three years later. After leaving college he became a teacher in New London, Connecticut, intending eventually to enter the ministry. Hardly had his career begun when tidings arrived of the outbreak at Lexington. His spirit was fired, and at a mass meeting of his townspeople in Minery's Tavern, he dedicated his life to the cause of American liberty.

"Let us march immediately, and not lay down our arms until we have gained our independence!" he said in most ardent tones. Before the meeting closed, a company had been formed, and at daybreak it was on its way to Boston.

It was during the siege of Boston that Hale displayed his great ability as a leader. In consideration of the services rendered there, he was commissioned a captain.

During the summer of 1776, the American Army suffered most. The battle of Long Island had been disas-

Schoolhouse where Nathan Hale taught, now a museum.

trous, and a hasty r
treat had been made
Manhattan Islan
The outlook was di
couraging. Men we
ill and were dying
appalling numbers; desertions we
many; the army was being rapidly de
imated. Lack of food and the failu
to receive pay were breeding insubord
nation, and not more than fourte
thousand men were fit for duty. Acro
the East River was a British army
about twenty-five thousand season
troops, and in the lower bay a powerf
navy lay stripped for action.

For the first time since Washingt
had taken the field, he was worried a
depressed. On every side he saw
choice of difficulties confronting him.
a letter to the President of Congress,
writes:

"It is evident the enemy mean
close us on the island of New York,
taking post in our rear, while the shi
ping secures the front, and thus,
cutting off our communication with t
country, oblige us to fight them
their own terms, or surrender at disc
tion; or by a brilliant stroke endeav
to cut this army in pieces, and secu
the collection of arms and stores, th
well know, we shall not be able soon
replace."

The question was: How could t
enemy's plan be most successfully
posed and defeated? To Washingt
there seemed but one way of discov
ing Howe's plans, and that was for
competent person to enter the Brit
lines and procure intelligence of th
designs. The duty of finding a volu
teer for this delicate enterprise was l
to Lieutenant-Colonel Knowlton, w
had distinguished himself at Bunk
Hill, and had some of the best fight
under him.

Summoning his officers for a conf
ence, Colonel Knowlton explained
them the situation and the vital imp
tance of the mission. But his plea w
met with cold response. The work
quired of them, so they argued, w
degrading for men of honor and refi

ent. Colonel Knowlton was about to
e way to despair when Captain Hale,
aciated from the effects of a recent
ness, entered the room and volun-
ered to undertake the work requested
his Commander-in-Chief. In vain
ale's brother officers tried to dissuade
n, but no argument deterred him
m his resolve to serve his country.

"I think I owe my country the ac-
mplishment of an object so important,
d so much desired by the Commander
our armies, and I know of no other
de of obtaining the information
an by assuming a disguise and passing
o the enemy's camp. I am fully
nsible of the consequences of discov-
y and capture in such a situation, but
a year I have been attached to the
my and have not rendered any mate-
l service. Yet, I am not influenced by
e expectation of promotion or pecu-
ary reward. I wish to be useful, and
ery kind of service necessary for the
blic good becomes honorable by being
cessary. If my country demands a
culiar service, its claims of the per-
mance of that service are imperious."

Accompanied by Colonel Knowlton,
ptain Hale presented himself to Gen-
l Washington and received final in-
uctions.

Assuming his professional character
schoolmaster, he was taken down the
und at night and landed at Great
ck in Huntington Bay, where he
ldly plunged into the enemy's lines.
ptain Hale was gone about two
eks, and in that time made the
nds of the entire British camps, in-
ding New York, of which the enemy
d taken possession September 15.
e schoolmaster completed drawings
their defenses and jotted down in
tin the information he had gathered.
er completing his dangerous task,
ptain Hale retraced his steps to
ntington, where a boat was to meet
n and convey him to the Connecticut
re.

According to some writers, Hale was
rayed by a cousin who recognized
n sitting in Widow Chichester's tav-
ern waiting for his boat; but no proof exists for the authenticity of this report. It is more ely, however, that in the dark he took the small boat from the tish flagship *Halifax*, which had m sent to shore for water, for his own, l did not discover his mistake until found himself a prisoner in the hands the enemy. He was taken aboard ship, stripped and searched. The ns and Latin memoranda were found den between the soles of his shoes. this evidence, he was adjudged a , and immediately hurried to New rk, where he landed on Saturday, ptember 21, the day of the great fire ich destroyed four hundred build-rs. The prisoner was taken to Gen-l Howe's headquarters in the Beek-n mansion, Fifty-first street and st avenue.

Memoranda Were Found in His Shoes

It is said that General Howe had retired in the greenhouse at the rear of the mansion, when the young patriot was brought before him. Hale denied nothing. He admitted he was a captain in Washington's army, and that he had been sent on a secret mission, but regretted that he had failed.

After a brief parley he was sentenced to be executed at daybreak the next morning. He was taken in charge by the notorious Cunningham, provost marshal of the Royal army, who boasted of having been responsible for the death of several hundred Federal prisoners, who were confined in the old sugar-house prison.

Captain Hale was thrust into one of the numerous cells beneath the prison, and here his death warrant was read to him by Cunningham. As the keeper was departing, the young patriot requested that his arms which had been securely bound might be released, and that he might have some writing materials and a light. Cunningham brutally denied him these favors, as he did also his request for a Bible. Later, however, a young officer of Captain Hale's guard interceded, and a light, pen and paper, as well as a Bible, were given him.

His Death Warrant Read to Him

The Captain passed the night writing. One letter he indited to his mother, another to his sister, and a third to his sweetheart. What happened after he finished his writing we have no means of knowing, but it is likely that he devoted the rest of the time to prayer.

At daybreak the door of the cell was opened and Cunningham, accompanied by a file of guards, entered. They found Hale ready to meet his fate. To Cunningham the patriot handed the letters which he had written, and as a dying request asked that they be forwarded to his family. Cunningham read the letters and in Captain Hale's presence destroyed the last message of the man about to die. When asked later why he had done this, Cunningham said: "I did not want the rebels to know they had a man who could die with such firmness."

They Hanged Him at the Dawn of Day

The dawn was just breaking when Captain Hale was marched to the place of execution. Then, while the patriot stood on the rounds of the ladder, with a noose about his neck, Cunningham demanded of his victim his last dying speech and confession. It is said that Captain Hale glanced at him with a look of contempt but paid no heed to the man's sneering remarks. Then turning to the others he impressively uttered the imperishable words: "I only regret that I have but one life to lose for my country."

Fact Versus Fancy

IN SPITE of pictures made to flatter national vanity, or to make heroes super-heroic by adding trappings, it is a fact that in Washington's army uniforms were exceedingly rare and the appearance of the troops very unsoldier-like. "Eleven thousand men," wrote Lafayette in his memoirs, vol. 1, p. 19, "ill-armed, and still worse clothed presented a strange spectacle. Their clothes were parti-colored and many of them almost naked. The best clad wore hunting shirts, large gray linen (cotton) coats which were much used in Carolina . . . They were always arranged in two lines, the smallest men in front."

A true picture would show men in ordinary straw or cloth hats costing a trifle, and a kind of smock, homemade, belted round the waist and hanging loose about the hips, much in the style of a Russian peasant's blouse. Trousers were of a material somewhat similar to that of which present-day overalls are made. Sydney G. Fisher is authority for the statement that "into the ample looseness above the belt were stuffed loaves of bread, salt pork, dried venison, a frying pan or a coffee pot."

America Takes Her Place in Textiles

American Dyes and Dress Fabrics Are Now in Line With Europe's Best

By JEAN MOWAT

ILLUSTRATED BY W. W. CLARKE

THE advancement of America into a position of importance in the color and fabric world is largely due to the war. During those early years we were able to secure some dyestuffs and fabrics but as more nations were drawn into the conflict and it became more intense the European world lost all interest in supplying these items to any nation.

American chemists were forced to give attention to the making of dyes and before the war ended had turned out many new formulae which have since proved their worth. During those days of experimentation whenever an article faded women loudly proclaimed it was because of poor dyes, and bewailed the lack of the good old days when German dyes were considered supreme.

Those days have long ago passed. In 1924 more than 300,000,000 yards of cotton materials were dyed in the United States with American dyes or ninety per cent of the goods handled. Before the war ninety per cent of the goods were dyed with German dyes. All materials dyed by American-made colors are given most severe tests, not just the usual chemical ones, but exposure to sunlight, rain, soil and then any number of washing tests both with pure soap and those having a caustic base to determine just the reaction.

So far there is only one test which has not received the O. K. tag and that has to do with the individual himself—perspiration. The acid in this will affect the dyes and yet it is only apparent across the back, and under the arms when one becomes very warm. This is a problem which confronts the department store's adjusting bureau a dozen times a day and the only recourse is to have the article re-dyed, the same shade or darker, to keep the customer's good will and her trade, although the store is in no way responsible for this and the blame cannot be attached to either the manufacturer or the dyer, for the latter is not dealing in such intimate fundamentals.

The other day a woman brought into one of the department stores a beautiful piece of gingham, in a dress length, which she claimed had faded. An examination proved she was right. A comparison with the material on the bolt was made and this revealed no streaks. The sales check showed the purchase had been made within the week and the matter was taken to the attention of the buyer. He examined the merchandise and then questioned the woman as to what she had done to the gingham.

"I just soaked it several hours in salt and water to set the colors and then hung it on the line to dry. I didn't want to make it up without shrinking and I certainly didn't want it to streak. Just look at that, and I'm certainly glad I didn't make it up. That's some of those American dyes I suppose."

The buyer studied the material and the customer. "Madam," he said, "we will give you another dress length on consideration that you never try any of these ideas again. The material has been shrunk by the manufacturer, it has been dyed to withstand ordinary wear, washing and sunlight but I assure you if a solution of salt and water would make any dye fast there isn't a manufacturer who would neglect to use it.

"It is a very cheap product. The material is warranted not to fade under ordinary conditions but a salt bath to any such delicate tissue as this is more than sufficient to ruin the best set dyes. Never use anything but pure soap in washing dyed materials, without a caustic base, and you'll have no trouble about the colors. Dry the garment in the shade and this will also prevent fading as well as streaking."

In commenting upon this incident the buyer said to me: "Women have some queer notions which must be dislodged if dyes are to be as good as rated. Many think a solution of salt or vinegar will help to set a dye when it does much to 'unset' it. Such home brew ideas are very expensive to the trade and we try to teach our customers the importance of pure soap in all washing and the need of shade for drying colored materials."

The story of the success and progress made by the dye industry in this country reads like a romance, according to Dr. Charles E. Herty, president of the Synthetic Organic Chemical Manufacturer's Association. "In the field of dyes alone 177 new products have been officially announced to the Appraiser of the Port of New York," he said, "and I am happy to record the fact that of this number 162, or ninety-two per cent, have come from firms which make the active membership of this association.

"The quality of the products has been so constantly improved that upon the willing testimony of consumers I do not hesitate to say that today our consumers are getting from American plants the highest quality they have ever used. But an equally great triumph has been won in the matter of prices of dyes.

"Without the slightest fear

It is a problem that confronts the department store a dozen times a day.

tradiction, I state, upon the basis official records, that, taking the ghted average of dyes as a whole, erican consumers are today paying for dyes than are the consumers in other country of the world; and e than that, if the present-day ue of the dollar be taken into con-eration, American dyes are being cheaper today in America than e German dyes before the war."

This authoritative statement seems ndicate that the American woman today "slams" dyes made in this ntry just because some of them fade dently does not know the true ation and yet it is a fact that ers and clerks have to fight every in the week. A noted foreign nufacturer recently in this country le on a two years' tour of the world, ching at every important manu-uring or consuming point in view dyestuffs, said that a change of ssal importance to world markets at present taking place. Frans nken, of Tilburg, Holland, a dye ker, further amplified this thought saying, "There can be no question t America will soon manufacture the ater part of the world's supply. ore the war Germany manufactured ut 50,000 tons annually. This com-ed practically the entire demand, h the exception of a small quantity le in Switzerland. At the present e England, France and the United tes manufacture about 25,000 tons. world's consumption has increased. Germany has, efore, fallen off about half, ough she still holds the l. Switzerland has not n affected by the change; still holds the same place efore the war. While as American-made dyes are expensive in most cases, e can be no doubt that time is very near when erica will stand out pre-nent in the manufacture niline dyes."

The great advance in ile manufacturing has en closely related to dyes as a result much of the nistication of colors can be ed back to this source, al-gh the American dyer and nufacturer of textiles ot working with the e very close link-up t distinguishes e of the foreign ructs. Part of is attributed to that too much or will not sell, ich is right. In ope a manufac-urer with an ideafor ultitude of tones fine cotton will only have the on dyed in the sual manner, but will apply colors to yarn. That is, the skeins of yarn (ready for weaving) are passed over colored rollers and the usual drying process follows. This effect of so treating white yarns which are worked in with the dyed yarns makes for most unusual and interesting color effects.

The word *foreign* as a label on fabrics acted as a great spur to the average shopper previous to the war. I once heard a famous dressmaker say that before the World War there was, if the salespeople were judges, nothing but foreign materials ever made or offered to the average customer. But as the war continued there did not seem to be any less material shown and it was very lovely in both design and coloring.

"I'm sure I don't know what we will do when these goods are sold," said one woman who was hostess at a patriotic tea during the early war days. "For so many years we have been dependent upon Europe for our lovely dress goods that I fear we will have much difficulty in finding desirable materials. Perhaps we will have to wear paper dresses, or ones made from sheeting because we do raise cotton in this country." Such expressions were not uncommon and many women bought for the day when dress goods would be scarce and the counters and shelves of the stores bare!

The war began in August and by that time the autumn buying had been completed as far as materials were concerned. The leading dressmakers had always made at least an annual pilgrimage to the fabric and style centers, London and Paris, to place orders for "exclusive" materials for their own use. The next July (1915) one dressmaker who had dealt with an important foreign house for some years saw the American manager and asked him what the prospects were for fine materials from his house for the autumn. He promised that she would be well cared for, and not to do any worrying over conditions. A few weeks later the Paris representative who had always called upon her when she was abroad, came to her establishment and displayed the line, as full and as complete and colorful as at any time in the past decade. "I don't understand how you have been able to turn out these materials with a war on," she said. "Haven't you lost many of the men from the mill?"

"Yes, several have responded to the call," answered the man, "but our organization is still intact and we expect to keep it very largely so."

"But I am greatly confused. You are a Paris house and a war of any duration will mean big losses to your firm. How do I know that I can even have this order delivered, or how dare you come here soliciting business when you aren't even sure you can deliver?"

"Madame," and the representative, with his slight French accent, drew himself up to his full height. "I am glad to inform you that our mills weave this merchandise in America. So great was the demand for foreign materials that we were compelled to sell our output as such, from Paris, to stay in business. It was not thought possible that such fabrics could be made in America, so we had them wrapped in Paris and sent back to you. We *can* deliver the merchandise, just as you order."

In relating this story to me the famous modiste said: "You could have knocked me over with a feather! I was never so surprised in my life and yet I expect that 'foreign' idea has been put over on us right and left because we could not or would not see that our country was progressing and here we are, in a great war, and our merchandise as lovely as anything we have ever had. Even I thought it was all imported. Well, I am sure that we can all prove our patriotism by using these mate-

The time is near when America will stand out in the manufacture of American dyes.

Sunbury, Leader in Fight for Liberty

When the Brave Defender of Fort Morris Said, "Come and Take It!"

By JOHN T. FARIS

JAMES OGLETHORPE had an eye for the beautiful and for advantageous situations. His choice of the site of Savannah proves this, as does his selection of St. Simon's Island for his home and for a defense against the Spanish. More than once during his journeys along the coast, his eyes rested on a high bluff on the Midway River—named, probably, because it was about halfway between the Savannah and the Altamaha River, which formed the northern and southern boundaries of the colony, where the live oaks and the magnolias drank in the sunlight, and where it was possible to see far out over the waters of the sound to the green islands beyond.

But it was not until 1758 that definite plans were made to build a town on the pleasing site. Mark Carr, who in 1757 had received a grant of five hundred of the delectable acres, arranged with five men to develop three hundred acres as a town to be called Sunbury. One hundred acres were to be set apart as a common, while the remainder was to be sold in lots for his benefit. Evidently the name was chosen in honor of Sunbury on the Thames, in England. One of the five men was later chosen to assist Benjamin Franklin in his difficult mission to England for the solution of the difficulties with the Mother Country which later led to the Revolution.

Above—In Midway Churchyard, Georgia. Below—The ivy-covered wall inclosing the cemetery is built of brick brought from England as ballast.

The district to the north of the Midway was already occupied by many settlers, among others the members of the Midway congregation, a church organized by the descendants of Puritans from Massachusetts who, in 1697, had moved to South Carolina, and in 1752 had gone to the fertile lands of the swamp regions close to the Midway. At the time Sunbury was founded, there were in the Midway about three hundred and fifty whites, and perhaps fifteen hundred Negroes.

The faithful trustees of Mark Carr, encouraged by the presence of these pioneers, laid out on the Midway nearly five hundred generous lots and three public squares, which they called King's Church and Meeting. Wharves were built, population was attracted, and within three years the governor of Georgia declared Sunbury a port of entry.

A history of Georgia which was published in Savannah in 1811 told how prosperity persisted in spite of the bad name given by a fatal plague that took away many of the inhabitants. He added the picturesque fact that seven square-rigged vessels had been known to enter the port of Sunbury in one day. The town was not yet twelve years old when "it was thought by many, in point of commercial importance, to rival Savannah." In 1772 fifty-six vessels were entered and cleared at the custom house. Although the town was twelve miles from the sea, on a river only twenty-two miles long, the depth at the wharves was fifteen feet.

The extent of the trade and ambition of the town has been told by Charles C. Jones, in a paper prepared for the Georgia Historical Society. It "commanded the rice crop from the adjacent swamp regions. Indigo was planted on the island just below, then called Bermuda, and now known as the Colonel's Island." The trade was not only with the West Indies, but also with the Northern Colonies. "From the former, supplies of rum and sugar were obtained, and from the latter rum, flour, biscuits and provisions. To the West Indies were shipped rice, corn, peas, indigo, lumber, shingles, livestock, and barreled beef and pork."

It is related that Governor Wrigh of Georgia thought this trade with th North was injurious to the Province Georgia, because "they take but litt of our produce, and drain us of ever trifle of Gold and Silver that is brough here, by giving a price for Guinea Moidores, Johannes's Pistols and Do lars far above their real and intrins value, so that we can never keep an amongst us."

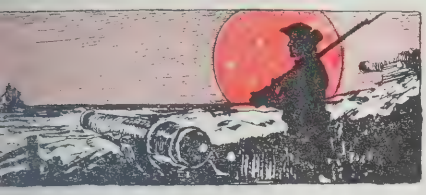
The interior trad proved to be so lucr tive that Sunbu even thought of ha ing a canal conne tion betwee Midway and Nor Newport rivers; would have been ne essary only to dred a channel betwe Bermuda Island a the mainland.

Vessels from En land preferred Sava nah to Sunbury, b they were glad enou to load goods fr the Midway tow These were taken coasting sloops a schooners who navigators kne how to take f advantage of t network of inla passages along t Georgia coast. N far from the to there was a landi where staves a shingles were load for Savannah. century after t town was in its glory the site of t landing was known, as well as location of the old shipyard wh owners were equally skillful in repair vessels, and in building them from keel.

A glimpse of Sunbury and its nei borhood has been preserved in writings of William Bartram, Philadelphia naturalist, who tramp from Pennsylvania to Florida in search for rare plants for his priv garden in Philadelphia, and for friends in England. After stopping Savannah, he went on horseback "Sunbury, a seaport town beautifu situated on the main between Midw and Newport rivers, about fifteen m south of the Ogeechee River. The to and harbor are defended from the f of the seas by the north and so fronts of St. Helena and St. Catheri islands." He seemed somewhat sur prised, on the day of his arrival, to h the opportunity of passing the even

the circle of genteel and polite ladies
d gentlemen."

The population of the town in-
eased until there were about one
ousand inhabitants. During the
mmer there were, in addition, many



itors from the country; planters
rned to take their families there to
oid the malaria in the swamps sur-
unding their homes.

Prosperity culminated in the days
st before the Revolution, in which,
om the beginning, Sunbury had a
ble share. The parish of St. John, of
hich the town was part, possessed
e-third of the entire wealth of the
ovince. And one of the well-to-do
en was Dr. Lyman Hall, a rice planter,
ember of the Midway congregation,
ose valiant advocacy of action to
ure redress from Great Britain led
his choice, on March 2, 1775, as a
legate from St. John's Parish to the
st general Congress. It is recorded
at when, in May, he went to Phila-
lphia, he carried with him, as a gift to
e patriots in Massachusetts, one hun-
ed and sixty barrels of rice, and fifty
pounds sterling.

Two of the Signers from Sunbury

His election to and seating by the Continental Congress preceded by
veral weeks the decision by the remain-
of Georgia to follow the example
St. John's Parish in opposing King
orge. When the colony acted as a
ole he became a delegate from all of
orgia, and not merely from a single
rish, and so felt justified in taking
rt in the voting as well as in the
bates that led up to the adoption of
e Declaration of Independence. The
dependent action of St. John's Parish
nding a delegate to Congress was a
otest against the slowness of Savan-
h and other portions of the colony in
king a stand. Indignation at Sun-
ry was so great that the town
olved to interrupt trade with Savan-
h, and even applied to the Commit-
e of Correspondence in Charleston,
uth Carolina, for permission to trade
th that city, "according to the act of
n-importation to which they had
eady acceded." Although South
rolina refused to allow them to do
is, since they were a part of the
lony of Georgia, which had not yet
en united action, they persisted in
eir enmity to Savannah.

When the Declaration of Independ-
ce was ready, three delegates from
orgia signed it, and two of the three
re from Sunbury, Lyman Hall and
tton Gwinnett, who lived in St.
Catherine's Island, within sight of the streets where he was a constant visitor.

It is not strange, then, that leaders in Great Britain were told that St. John's Parish was the heart of the rebel movement in Georgia. A proud Georgia orator has paid tribute to her patriotism:

"Alone she stood, a Pharos of Liberty in England's most loyal Province, renouncing every fellowship that savored not of freedom and refusing every luxury which contributed to ministerial coffers. With a halter around her neck and the gallows before her eyes, she severed herself from surrounding associations and cast her lot, while as yet all was gloom and darkness, with the fortunes of her country, to stand upon her rights or to die in defending this proud spot of Georgia's soil!"

When Fort Morris Was Held by the Patriots

Not content with what their representatives were doing in Philadelphia, the citizens enlisted in the State Militia, and took measures for local defense. A fort was built. On July 5, 1776, Congress determined to garrison two forts in Georgia—one at Savannah, the other at Sunbury. The Sunbury fort was called Fort Morris; it was a substantial inclosed earthwork, mounting twenty-five cannon, which were so placed as to command both land and water approaches.

The fort remained in the hands of the patriots until 1779. Late in 1778 General Augustine Prevost sent against Fort Morris, by sea from St. Augustine, a detachment of infantry and light artillery, and by land, under a force of British regulars. Patriot troops who opposed this last expedition succeeded in turning them back, though not until they had burned and pillaged wherever they went. Among other buildings burned was the Midway Meeting House, nine miles from Sunbury.

One of those who disputed the advance of the British was Colonel John Baker, whose son later wrote a poem in which he told of the desolation wrought by the invaders and the Indians who accompanied them:

Where'er they march, the buildings burn,
Large stacks of rice to ashes turn:
And me (Midway) a pile of ruins made,
Before their hellish malice staid.

Nor did their boundless fury spare
The house devote to God and prayer:
Brick, coal, and ashes shew the place
Which once that sacred house did grace.

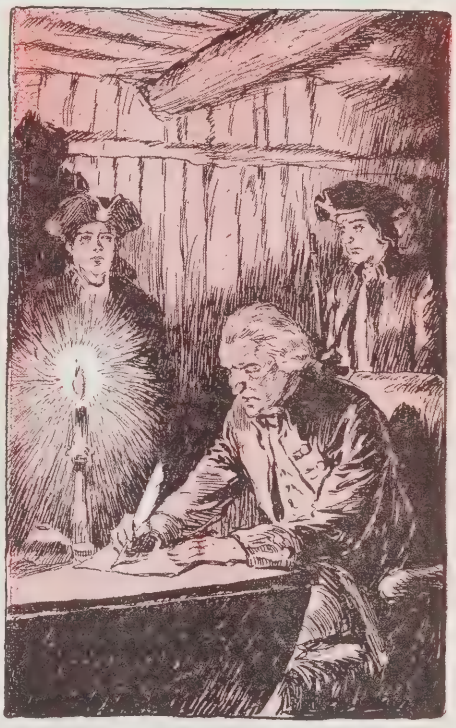
The churchyard, too, no better sped,
The rabble so against the dead
Transported were with direful fumes
They tore up and uncovered tombs.

But the force sent by sea managed to reach Fort Morris. Then the leader summoned the commander to surrender, telling him that his fate was sure, threatening to destroy all property if the surrender was not made, but promising that all should retain their property if they would agree to "remain neuter until the fate of America is determined."

Like a true patriot, the commander of the fort made answer:

"We have no property compared with the object we contend for that we value a rush, and would rather perish in a vigorous defence than accept of your proposition. We, Sir, are fighting the battle of America, and therefore disdain to remain neutral till its fate is determined. As to surrendering the fort, receive this laconic reply: *'Come and take it!'* "

Furthermore, the intrepid leader of the defenders of Fort Morris told the besieger that if he carried out his threat to fire the town, he would set fire at one end, when the British fired it at the other end. Then he concluded: "And let the flames meet in mutual conflagration."



The arrogant leader of the invaders decided to withdraw, intimidated by the boldness of a Scotsman who had but few more than a hundred men to build earthworks to oppose a large force. But the enemy did not know these facts. And so a promising campaign was brought to naught by the pluck of one patriot. No wonder Georgia was proud of him, or that the legislature gave him a sword on which were engraved the words, "Come and take it."

Holding the Fort Against Heavy Odds

The besieger decided to put to sea once more. Sunbury was let alone for a few weeks, but in January, 1779, he returned and again demanded surrender. The doughty commander, in spite of the order of General Howell to make no defense, told him that "duty, inclination and means pointed to the propriety of defending the fort, against

any force however superior it might be." But his boldness proved to be greater than his ability; before long he was compelled to yield to the British, who, having already taken Savannah, were preparing to reduce all of Georgia.

During the period of British control, Sunbury and the surrounding country were all but depopulated. The patriots continued to show their characteristic bravery, but the odds were too great for them, and when the enemy withdrew at the close of the Revolution, the town was a ruin.

The Town Was Famous for Education

For years attempts were made to revive the place. Its chief citizen, Lyman Hall, became Governor of Georgia, courts were held there, and commerce grew, to a degree. But in 1798 the county seat of Liberty County —years before the name had been given to three parishes, of which St. John's was one, in recognition of their primacy in patriotic activities before the beginning of the Revolution—was removed to Riceboro.

For some years the town was famous as an educational center, because of the presence of Sunbury Academy, established by the state in 1788. But the population steadily declined, and shipping fell off. In 1804 a hurricane wrought fearful havoc, and made the residents feel insecure. Disease followed, and in 1824 another hurricane completed the destruction. In 1829 *Sherwood's Gazette* of Georgia told the melancholy tale that there were but twenty houses and one hundred and fifty people left where fifty years before there had been such wonderful evidence of prosperity.

It is recorded that the last vessel of any moment that visited the town was a Swedish brig which, in 1814, came in and took away a load of cotton. For nineteen years longer the Liberty Independent Troop went to Sunbury each Fourth of July for a celebration. Their coming was the event of the year; then the United States revenue cutters in neighboring waters would enter the river and make the old residents feel that the days of shipping had returned.

Ceased to Exist Over Seventy Years Ago

It is now seventy-five years since Sunbury ceased to exist. The buildings have disappeared. The streets cannot be detected from surrounding cultivated ground. The graves are hidden among the undergrowth. A recent visitor to old Fort Morris, for which Sunbury should ever be remembered, has told how large trees are growing on its parapets. The footpaths are obscured by an undergrowth of weeds and briars. But when the ramparts of the old defense are reached, they can be traced in detail, to the joy of those who wish to see all that is left of the last fort in Georgia to lower the colonial flag to the ruthless invaders.

The Story of the Old Burial Ground

And this was "the home of Lyman Hall and Button Gwinnett, signers of the Declaration of Independence, of John Elliott and Alfred Cuthbert, United States Senators from Georgia; of John A. Cuthbert, member of Congress; the birthplace of John E. Ward, Speaker of the House of Representatives, president of the Georgia Senate, and United States minister to China; for some years the residence of Richard Hawley and Nathan Brownson, governors of Georgia; and numbering among its citizens clergymen, teachers, physicians, lawyers, merchants and planters whose influence was appreciated in their day and generation."

Some of these famous men were buried in the old Midway burial ground, at the side of Midway Church, amid the live oaks that have been growing for two centuries. Few come to the neighborhood, except once a year when a service is held in the historic church, and those who attend walk among the overgrown graves marked, many of them, by curious stones, or by markers of the everlasting cypress.

Loaves and White Hyacinths

(*Concluded from page 2*)

and the tastes of those concerned, the average family of moderate income will divide its loaves about as follows:

	Per Cent
Shelter	20
Operating Expenses	15
Food	20
Clothing	17
Savings	10
Miscellaneous	3
White Hyacinths	15

Shelter, at 20 per cent, means that it can go for rent, or buy a home through a building association. That is one of the surest ways for a family to save.

Operating our homes—running expenses and service—takes 15 per cent. Food for a healthy American family means another real cut in the income, though the amount can be lowered by a careful study of food values. Clothing takes another slice, and savings, and the odds-and-ends that are hard to classify in columns.

That leaves just 15 per cent for our White Hyacinths, but can you do better?

We must have homes, and food and clothing, and there is something soul-satisfying in savings, even to those of us who are far from Vermont!

Books, magazines, amusements, church, and charity contributions—these are our White Hyacinths. We need them as much as we do the loaves, but we do not have to spend as much for them. There are public libraries where we can get the books and magazines we want, except the ones that seem to *belong* in our families. But the butcher must be paid. We war canned things in the pantry as well a books in the library.

We want to give to church an charity appeal—but I know that thos of us who budget really *do* give th per cent we decide is compatible wit our incomes, while a great many pe sons who do not budget are honestl under the impression that they give great deal more than they do. The are so many appeals, and the haphaza giver becomes confused in his figure We give our slice, even if we do refu the whole loaf.

Oh, I'll admit that it doesn sound as well at first thought to s that we spend 85 per cent of our i come for the loaf-ly things! Mahom *reads* much more nobly! But we who a budgeting raise our own Hyacinth On our credit side we have healt children, orderly living, ambition and all our bills paid. That is mo satisfying to the soul than a lar order of florist's Hyacinths. The kin we grow at home give us more actu pleasure.

So when our "advanced" grou talks so glibly of "materialism" look around for the Khadijahs in t background, putting up the ext loaves.

And on, further back, for the wom who baked her own bread, and ma her own soul.

"HOW SLEEP THE BRAVE"

How sleep the brave, who
sink to rest
By all their country's wishes blest!
When Spring, with dewy fingers
cold,
Returns to deck their hallowed
mould,
She there shall dress a sweeter sod
Than Fancy's feet have ever trod.

By fairy hands their knell is rung;
By forms unseen their dirge is sung;
There Honor comes, a pilgrim gray,
To bless the turf that wraps their
clay;
And Freedom shall awhile repair
To dwell, a weeping hermit, there!
